The Valley will produce about 45,000 tons of raisins this season.

Estimates of Tulare County orange growers indicate a big crop.

A chrysanthemum show is planned for Kerman on November 11th.

Tulare County citrus growers are already shipping their first pomelos.

The Fresno Poultry Association is discussing the matter of a winter show.

The Selma Creamery has been sold to San Francisco parties. It will be enlarged and improved.

Fruit growers near Kerman, Fresno County, are ordering bluestone for the coming season's spraying.

Dr. Wiley's answer as to what constitutes a ripe orange is in effect "they are ripe when they are ripe."

Between 2,500 and 3,000 acres of oranges will be set in the Lindsay district, Tulare County, this year.

Olive planters are looking over lands near Madera and getting information as to olive planting conditions.

A serious condition as to rabies obtains in Tulare County, and it is now feared that coyotes may be spreading the disease.

It is now suggested that the squirrel campaign may be materially aided on the forest reserves by the forest rangers joining in the poisoning campaign.

County Horticultural Commissioner Fowler of Tulare County has samples of the Utah alfalfa leaf weevil, but they were sent from Utah in a bottle.

San Jose now claims to be the chosen spot for the location of the state game farm which has been located for several years at San Leandro.

One raisin grower of Empire, Stanislaus County, made 30½ tons of raisins from five acres of Thompson Seedless vines which were less than five years old.

A petition for the formation of the Wilbur Reclamation District has been approved by the supervisors of Kings County. It calls for the reclamation of 27,000 acres.

The newly formed company which has taken over the sugar factories at Visalia and Corcoran gives assurance that the factories will be ready for next season's run.

A meeting of farmers at Patterson, Stanislaus County, was held on October 21st and the Patterson Irrigated Farms Association was formed. Its primary object will be marketing products of the members.

Prof. Crosby of the Department of Agriculture, who delivered an address before the country life commission at Davis on the matter of country education, has visited the Kearney estate near Fresno which he declared "is the finest piece of agricultural or horticultural development I have ever seen."

Governor Johnson has appointed as candidates to the coming dairy convention at Chicago: J. W. McAllister, Chino; Guy H. Miller, Modesto; A. C. Morris, Woodland; Assemblyman J. H. Guill, Chino; Henry Timm, Dixon; George A. Smith, Corcoran; Edward H. Locke, Lockford; W. B. Cartmill, Tulare; Louis N. Belknap, San Jose, and S. A. W. Carver, Los Angeles.

Southern California

Yucaipa Valley held an apple show last week.

Ontario, San Bernardino County, observed its El Festivo last week.

Extensive planting of oranges is promised for the coming season.

Escondido broke all records in shipping of Muscat grapes this season.

Sixty thousand eucalyptus trees will be planted on a tract near San Fernando.

The sugar factory at Anaheim has closed for the season. It handled 50,000 tons of beets.

Ventura County has finished sacking her beans. The crop is said to be the finest quality.

Olive growers over the southern end of the state are generally making money this season.

One Orange County horse was recently killed because of rabies which came from bite of a dog.

The walnut growers report that less than one-half of one per cent of the nuts this year are defective.

The supervisors in charge of forest reserves will make extensive plantings of eucalyptus this year.

Some Imperial Valley land under exceptional conditions has produced as high as three bales of cotton to the acre.

A rhubarb plantation at San Luis Rey, San Diego County, is now setting out 175,000 Crimson Winter plants.

At a meeting of the Escondido Poultry Association it was determined to hold the next show at Escondido, December 6 to 8.

The proposition to tax the dairymen of the San Luis Valley for dairy inspection is causing most strenuous objection on their part.

The advanced tariff proposed by the continental railroads for icing and precooling citrus shipments has been suspended by the interstate commerce commission.

Water users of the Imperial Valley are discussing the matter of bringing injunction to prevent taking waters of the Colorado by irrigators higher up on the river.

County Horticultural Commissioner Wilsie of Imperial County is making an effort to suppress shipment of alfalfa seed from Utah because of fear of alfalfa leaf weevil.

Arroyo Grande, San Luis Obispo County, is appealing for more generous planting of apples. It is claimed some exceptionally fine fruit has been grown in that section.

The Santa Ana Valley Walnut Growers Association packing house received over 69 wagonloads of nuts in one day last week. The value of one year's receipts was $20,400.

Orange county's celery crop will begin going forward this week. That one county will forward about 1400 carloads. The harvest will not be in full swing until about November 15th.

The filing of a suit against the California Fruit Growers Exchange in which it was charged that this great co-operative organization was a trust, it is thought will not lead to more than an exhibition of petty spite.

The Coast

Freewater, Oregon, is shipping three cars of apples daily.

Eugene, Oregon, opens its annual apple show this week.

Astoria, Oregon, has a cauliflower head weighing 12 pounds.

Redmond, Oregon, is preparing for its annual fall potato show.

Wenatchee, Washington, is shipping 24 cars of apples every day.

Egg consumers at Guaymas, Mexico, are paying 20 cents each for eggs.

The seventh annual agricultural fair will be held at Phoenix next week.

Live stock valuations in Montana decreased $2,000,000 during the last year.

Poultry fanciers at Albuquerque, New Mexico, closed a most successful show last week.

Potatoes are now selling at $19 per ton in some of the principal Washington potato sections.

An orchardist of Columbia County, Oregon, raised Hungarian prunes this year three inches in length.

The sugar factory at La Grande, Oregon, will run for several weeks because of the exceptionally heavy crop.

One of the sheep producing counties of Arizona shows a shrinkage from 18,000 ten years ago to 846 this year.

Outlook, Oregon, is shipping apples to Liverpool. The same section will produce this year about 500 cars of potatoes.

Washington and Oregon will both make extensive exhibits at the Northwestern States Land Show at St. Paul in January.

The commissioners of Bonner County, Idaho, have established a district for draining a great tract of about 40,000 acres.

Alfalfa seed producers at Vale, Oregon, have received 15 cents per pound and that section will market about $150,000 worth.

The Farmers Union of Irby, Washington, will buy coal and wood for its members. That one union has marketed over 100,000 bushels of wheat.

The natives near Zamboanga, on the island of Mindanao are being instructed in the growing of rice, which is now almost entirely imported for island use.

At the anti-smut convention at Pullman, Washington, it was decided that the loss from smut in the states of Washington, Oregon and Idaho aggregate $7,000,000 annually.

The south half of the large island of Mindanao in the Philippines is suitable for rubber plantations and it is reported that many companies are being formed for that purpose.

The inverted syphon under the Colorado River which will carry water from the California side to rich lands in Arizona, attracts many visitors as it nears completion. The tunnel is 14 feet in diameter in the clear.

A joint convention of the Oregon Dairy Association and the Oregon Butter and Cheese Association was held and the question of an exhibit to educate Portland consumers was discussed. A long list of prizes will be offered for the best exhibits at the show.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

AIDS IN SELECTING BREEDING STOCK.

The establishment and maintenance of a successful breeding herd means that the manager or owner must constantly be culling his stock. At the outset he must select the entire group; and as offspring are produced, selections must annually be made from these to replace the animals culled out and turned on the general market. Without a few permanent, well-fixed and definite rules for selections, few men can make any real headway in improving and building up their herds. Some men undertake to establish and maintain herds by haphazard selection, and then wonder why they do not succeed.

When it comes to actually picking out animals, it is extremely hard to put one point over all others as being of first importance, but there is nothing of greater importance than type. One of the first requisites to successful selection is to have a definite type in mind and to stick to it. As to what that type shall be, each man must choose for himself. The popular demand to some extent, and utility in particular should indicate to him a desirable type. The matter of importance is to decide upon some definite tangible type, and have it so clearly in mind that it will always be recognized. Then select animals of that type and nothing else, thus securing uniformity in the herd and in the offspring. Probably any one may recall individuals who have concluded without much thought that they would establish a breeding herd. They went out here and there to buy and did buy many good animals. But when these animals were assembled, they were of many types and made anything but a desirable foundation. Likewise their offspring presented the same wide range of variability. The principal reason for such results usually is that the man who got the herd together had no definite idea of what he wanted except what he vaguely defined as a good animal. The consequences could be nothing else than an incompatibility of types at mating time, and therefore almost every sort of offspring imaginable. The mating of different types within a breed is sure to cause variation in the offspring. This is a point that is often overlooked. Too many men fail to realize that nearly all our breeds of live stock have large enough numbers to present several different types. The breeding of animals simply because they are registered in the same herd book is no indication of judicious breeding.

Once a type is intelligently chosen, it should be adhered to rigidly. There is nothing else where it is a better policy to adhere to your standard than in the breeding business. The history of our modern breeds is replete with the names of men who fixed in their minds an ideal and strove constantly to attain it, never turning to the right nor to the left. This seems to have been one of the largest factors for success in the work of Bakewell, that remarkable pioneer of modern breeding practices. He early conceived a definite idea of what he might do, and he worked incessantly toward his ideal type. Cruickshanks' conception of the Scotch Short-horn was idealized in his mind as a beginner in the cattle business, but it was thirty years later ere he began to realize his hopes. Had he not shown the persistence of Job and held steadfastly to his idea of type through all those thirty years the whole cattle world would have been the loser. Successful breeders of practically all times bear testimony to the fact that not only are definite ideals necessary but constant adherence to them is of equal importance.

In fixing a standard and in selecting to fit it, the demands of the time and the probable demands of the future must be given due consideration. Rare indeed is that man who can produce something new and also create a demand for it. The financial aspect of the breeding venture always must be observed, and part of the wisdom of selecting rightly is shown by him who knows when to discard sound biological principles because of their too great cost. The thing of large value to any prospective or actual breeder is a full knowledge of the history of the breed he contemplates using. Every breed has its faults as well as its good points, and a complete knowledge of these is essential to accuracy in following a standard. A thorough knowledge of the breed from its beginning up brings clearly to the mind of a careful student the points which are most valuable and also those which are most undesirable. The knowledge of blood-lines and of the methods of the great constructive improvers of the breed emphasizes their bearing upon successful production. Taken altogether a thorough study of the breed history will do much toward indicating proper ideals. Such ideals carefully chosen and then adhered to constantly will do much toward putting beginners on the way to success. —Ellis Rail in Breeders' Gazette.

ITALIAN PROVERB.

A correspondent writes the Cultivator regarding the purchase of Eastern pure bred stock by California buyers, of some of whom it is charged by the correspondent that "Judging from the quality of stock brought back the East finds California buyers as easy to 'work' as the proverbial 'taking candy from a baby' proposition." In illustration a clipping from Wallace's Farmer of some months ago is sent, which we reprint in full:

The Italians have a proverb which, translated into English, is as follows: "Wife and stock select at home." Like many other proverbs, it presents only part of the truth, and is not of universal application. There is great good sense in the proverb applied to the choice of a wife; for if two are to make the greater part of the journey of life together, it is of the utmost importance that they should know each other before making a hard and fast engagement; and they are more likely to know each other if they have the opportunity which neighborhood association affords. In forming marriage engagements we are more likely to follow the ideal than the actual, and there is often disillusionment (very serious and sometimes humilating) when folks who marry without intimate knowledge of each other are obliged to put up with the actual and put the ideal away as a beautiful but unrealized dream.

On the other hand, no young man should feel obliged to take choice of what the neighborhood offers, unless the neighborhood is of a high charac-

ARNOTT & COMPANY 112-118 South Los Angeles Street LOS ANGELES CAL.

ESTABLISHED 1892

A Cheap Succulent Feed

Alfalfa hay is a wonderful feed, but like any other dry feed it is improved if used with a succulent feed. Dairymen have long realized that they needed something to go with their alfalfa, but have not been able to get it at any reasonable cost; so the majority have continued to feed just alfalfa, with perhaps a little bran or rolled barley.

Now is the Opportunity

You can balance your ration with appetizing, succulent Steam-Dried Beet Pulp—cheaper and better than any mill feed or grain, it makes an ideal combination with alfalfa hay—cows relish it keenly, and thrive on it splendidly. It can be used in the ration to replace an equal amount of mill feed or grain, or to replace *one and a half* times the amount of alfalfa hay.

It is the milk-producing qualities of Steam-Dried Beet Pulp which have made it famous. 8 lbs. daily, fed with 15 to 20 lbs. of alfalfa hay, forms a properly balanced ration for a thousand-pound-cow, giving about 30 lbs. of milk daily. You can safely figure on this ration to give you one to two quarts more milk every day from each cow—that means 3 to 6 cents every day from each cow. It's easy money, that you can get without the least trouble or risk.

It is also a splendid green feed for poultry. They are extremely fond of it.

Be Sure It's Steam-Dried

Steam-Dried Beet Pulp is the beets of the sugar factory with only the sugar extracted—and then *dried by steam.* The wet beet pulp has long been favorably known for its feeding qualities, but it is inconvenient, costly and objectionable to handle. When the beet pulp is *steam dried* it is packed in 100-lb sacks, and will keep for an indefinite time without spoiling. Steam-Dried Beet Pulp is always uniform in color and quality, never burnt or blackened by smoke, always clean and pure. Ask your dealer about it—or write us.

STEAM-DRIED BEET PULP
Just Like Roots
Makes More Milk

THE LARROWE MILLING COMPANY,
608 Central Building,
LOS ANGELES, CAL.

ter; that is, provided the young man has high ideals; and vice versa.

Neither must the maxim to select stock at home be taken in all literalness. The word imported has a wonderful charm for people who have not studied live stock conditions in other countries. The assumption that unless an animal is of superior quality it would not have been imported is often without foundation. On one of our visits to Scotland, we heard a description given to a certain class of horses, for which we could not understand the reason. They said: "This is an American horse." We asked, "What do you mean by an American horse?" The answer was: "We mean a horse that is good enough to ship to America, but not good enough for a dray horse in Glasgow." This was long ago; but it reminded us forcibly of a number of imported horses that we had seen, which answered quite perfectly this description. They were sent abroad because they were not good enough to be kept at home.

The United States has now reached a point when it should be able to produce as good live stock as can be produced in any other country on the face of the earth; not in every locality, but in some localities especially fitted for their production. We are under great obligations, however, to other nations for improved stock. We owe a great debt to England, to Holland and to France; but we have now reached a point where nothing should be accepted that is not of unquestionable superiority and undoubted lineage. In other words, we have reached a point when the utmost encouragement should be given to our home breeders, and the term "imported" should not be regarded, as in the past, a guarantee of superior excellence. The animal itself must prove that excellence, not by a certificate of importation, but by standing the tests which stockmen apply, or at least should apply, to all classes of animals, whether imported or of home growth.

In purchasing live stock, whether at home or abroad, we should keep in mind both environments. The animal is largely the creature of environment. There were breeds before there were breeders; and the breeders have simply perfected that which the environment first created. We must not expect to maintain the quality of stock of any kind unless we furnish them an environment, either natural or artificial, that will maintain and if possible improve the quality.

We have seen men vainly trying to make like produce like, after taking an animal from a superior environment to an inferior one; and we have never yet seen it succeed. We can safely remove stock from an inferior environment to a superior, and improve them until they measure up to the environment. Part of this environment is natural; soil, climate, superior grasses. Part of it is artificial; the care, the shelter, the indescribable something which we call skill or faculty on the part of the breeder — the judgment which enables one man to mate with surpassing skill, and the lack of judgment which frequently causes one man to fail where another in a precisely similar outward environment succeeds.

There is something in the really first-class breeder that approaches genius, something which can not be adequately described. If this genius continues from generation to generation, which it does not always nor often do, then we have a live stock farm from which a man can safely buy at apparently long prices. It is surprising, the genius of some of England's great men and great families, that have given us the best in some of our breeds of cattle. It is the lack of this genius in many cases that causes cattle to be sold more on reputation than on merit.

Therefore, give heed to the Italian proverb and follow it, but only so far as it is practicable and likely to lead to the best results. We might sum it all up by saying: Whether in wife

or live stock, select at home if you can do as well there as away from home; but in any case know what you are getting, so far as that is possible.

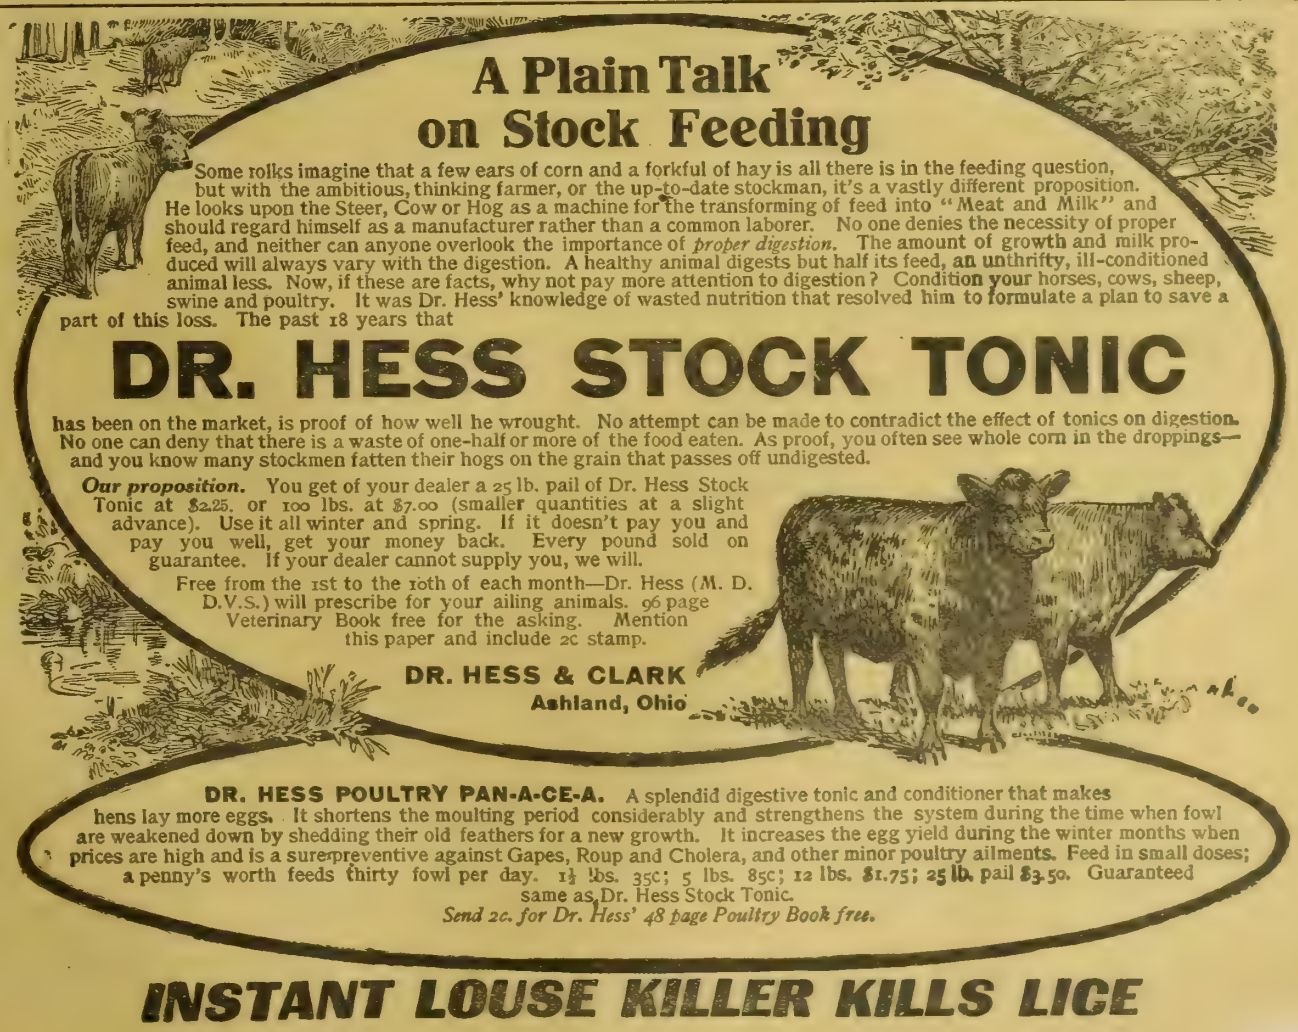
FROM MILK TO MILLIONS.

"Sudden riches, the transformation of milkmen into mining millionaires, the spectacular enrichment of individual apple growers in a few seasons," says Walter V. Woehlke, writing of the Inland Empire, Washington, in Sunset Magazine for November, "these are skyrockets that cause humanity to gaze at their blazing flights with admiration and envy. The dramatic element is strong in them, but contemplation of their fiery rise is of small profit to the toiling multitudes. The skyrocket leaves no path which the average man might travel except in an airship or by running the risk of a financial explosion at the start. But the trail of the plodder is plainly marked upon solid ground. It can be followed without leaving the earth. Take, for instance, the career of a poor Spokane milk man whose Bradstreet rating gradually, little by little, reached full seven figures. This man had no better start than a hundred others in the same business, but instead of taking up mining as a side line he devoted all his energy to the dairy. He studied every lacteal possibility of the cow, introduced modern dairy methods, made his products a little better than those of his competitors and broadened out from year to year until his wares were a familiar byword in all the Northwest. The progress of his herd from his modest start to its present position is plain even to the dullest eye, but travel along its trail is light. The glare of the ore and apple skyrocket is still dazzling the multitude. Therefore those undramatic products such as butter, milk, cream, eggs, poultry, beef and pork bring high prices in the Inland Empire. They are scarce. Trainloads of them have to be imported from other parts of the country for the consumption of the cities and of those who specialize in wheat and fruit exclusively. All the year round the demand for these prosaic staples exceeds the supply. There is money in dairying, in the chicken coop and in the piggery. For products the market is close at hand and this home market will increase rapidly.

A DANGER IN FEEDING ROOT CROPS TO BREEDING ANIMALS.

The value of root crops for feeding farm stock is generally recognized, and their more extensive use in this country for this purpose is often advocated, but investigations carried on by L. G. Michael at the Iowa station suggest that caution should be exercised in the feeding of sugar beets and mangels to breeding animals, and that there is a sound basis for the opinion long held by stockmen "that sugar beets and mangels when fed to breeding animals will in some way cause the formation of renal and urinary calculi, or kidney and bladder stones." In a series of experiments with rams extending over five years, it was found that "sugar beets and mangels favor the formation of renal and urinal calculi, or kidney and bladder stones, when fed to breeding rams," and it is thought "very probable that these roots have the same effect when fed to ewes or to cattle." In view of the fatal results often attending the formation of these stones it is deemed inadvisable to feed sugar beets and mangels to breeding animals, but there appears to be no particular danger in feeding these roots "to fattening animals, as the calculi are not likely to develop sufficiently during the fattening period to cause serious results."—Ex. Sta. Bul. 465.

It is an expensive operation to supply grain to cows with which to build up energy to fight flies.



A Plain Talk on Stock Feeding
Some folks imagine that a few ears of corn and a forkful of hay is all there is in the feeding question, but with the ambitious, thinking farmer, or the up-to-date stockman, it's a vastly different proposition. He looks upon the Steer, Cow or Hog as a machine for the transforming of feed into "Meat and Milk" and should regard himself as a manufacturer rather than a common laborer. No one denies the necessity of proper feed, and neither can anyone overlook the importance of proper digestion. The amount of growth and milk produced will always vary with the digestion. A healthy animal digests but half its feed, an unthrifty, ill-conditioned animal less. Now, if these are facts, why not pay more attention to digestion? Condition your horses, cows, sheep, swine and poultry. It was Dr. Hess' knowledge of wasted nutrition that resolved him to formulate a plan to save a part of this loss. The past 18 years that
DR. HESS STOCK TONIC
has been on the market, is proof of how well he wrought. No attempt can be made to contradict the effect of tonics on digestion. No one can deny that there is a waste of one-half or more of the food eaten. As proof, you often see whole corn in the droppings—and you know many stockmen fatten their hogs on the grain that passes off undigested.
Our proposition. You get of your dealer a 25 lb. pail of Dr. Hess Stock Tonic at $2.25, or 100 lbs. at $7.00 (smaller quantities at a slight advance). Use it all winter and spring. If it doesn't pay you and pay you well, get your money back. Every pound sold on guarantee. If your dealer cannot supply you, we will.
Free from the 1st to the 10th of each month—Dr. Hess (M. D. D.V.S.) will prescribe for your ailing animals. 96 page Veterinary Book free for the asking. Mention this paper and include 2c stamp.
DR. HESS & CLARK
Ashland, Ohio
DR. HESS POULTRY PAN-A-CE-A. A splendid digestive tonic and conditioner that makes hens lay more eggs. It shortens the moulting period considerably and strengthens the system during the time when fowl are weakened down by shedding their old feathers for a new growth. It increases the egg yield during the winter months when prices are high and is a sure preventive against Gapes, Roup and Cholera, and other minor poultry ailments. Feed in small doses; a penny's worth feeds thirty fowl per day. 1½ lbs. 35c; 5 lbs. 85c; 12 lbs. $1.75; 25 lb. pail $3.50. Guaranteed same as Dr. Hess Stock Tonic.
Send 2c. for Dr. Hess' 48 page Poultry Book free.

INSTANT LOUSE KILLER KILLS LICE

CONCERNING THE NUBIAN AND ANGLO-NUBIAN GOAT.

In your issue of Sept. 28th I notice an article on the Nubian goat. As a matter of fact very little is known of this breed, and most of our information is legendary. It is very doubtful if ever a pure Nubian has been brought into the United States and in England there are only authentic records of two does of this breed, and they were sent by the Duke of Connaught, as a gift to Queen Victoria, from the Soudan. Both these does died without leaving progeny. The amount of milk this breed is reported to yield, eight to eleven quarts per day, is simply preposterous; this is the average daily yield of an ordinary dairy Shorthorn. A goat would have to be as large as a burro to be physically capable of producing it. It is remarkable how people will exaggerate on this point.

Mr. Crepin, who has a small herd of Nubians which were exhibited on one or two occasions in Paris, announces three litres per day, a little over five pints, as the largest yield his does recorded. The statement that the Nubian is the finest milk goat in the world would seem to be incorrect.

Among intelligent people the fact that the Swiss nation has bred for milk by careful selection for centuries would have weight, while in Nubia the animals are allowed for the most part to run wild and in the care of ignorant natives.

The Anglo-Saxon Nubian, which must not be confounded with the true Nubian, is a made-up breed, like the Orpington fowl. It originated from a cross between the native common short-haired prick-eared goat of the British Isles, and the Oriental lop-eared breed, be it Nubian, Egyptian, Abyssinian, Chitral (Jumma Pari) or other similar Indian variety. As the Anglo-Nubian has been bred for over thirty years now in England, it is considered to be a breed in itself, though even after that length of time the kids come all colors, which is an indication of mixed blood. Also individual animals vary, some having lop-ears, others again have horizontally carried ears. As milkers they are fair, about three quarts per day being the rule. Also the milk is reputed to be richer in butterfat than the Swiss breeds.

A few of these Anglo-Nubians have been imported into the United States, from England and in San Diego county, California, there is a small herd. They are quite popular in England today, as they are best adapted to the damp climate of that country and for meat and draught animals.

I give as my authority for information on both these breeds H. S. Holmes Pegler, Hon. Secretary of the British Goat Society, who probably knows more about milch goats than any man or woman living today.—Mrs. Winthrop Howland.

Veterinary

Answers in this column by Fred G. Matthews, M. S., D. V. M., 1233 Central Ave., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Ringbone.

Kindly suggest a remedy for ringbone, and oblige—Subscriber, Earlimart.

Have your druggist prepare a blistering ointment composed of biniodide of mercury 3 drachms, euphorbium 1 drachm, cantharides 2 drachms, and petrolatum 3 ounces. Clip the hairs from the surface to be blistered, and apply the ointment with vigorous rubbing. Tie the horse so he cannot reach the part with his mouth. Allow the blister to act forty-eight hours, then remove with soap and warm water, and cover with lard or vaseline. Repeat in two weeks. The best remedies often fail to cure ringbone.—F. G. M.

Strychnine Poisoning.

Kindly advise me how to treat a dog poisoned by strychnine.—Subscriber, Grant's Pass.

(1) Begin with an emetic; two tablets of apomorphine hydrochlorate, one-eighth grain each, dissolved in a teaspoonful of water, should induce vomiting in ten or fifteen minutes. (2) When vomiting has ceased, give one teacupful of strong tea. (3) Then produce sleep by chloroform inhalations and rectal injections of chloral hydrate solution 20 grains in 2 ounces of water; or, better still, by hypodermic injections of morphine, using one (1) grain for each 16 pounds weight of the patient. Avoid, in every way possible, unnecessary handling and excitement, and if sleep has been induced by morphine, see that the dog is wrapped comfortably in a blanket during the six or eight hours the drug is acting.

Bitter Milk.

A Jersey cow, fresh last April, has on three occasions lately, for a few milkings, given milk that becomes bitter after standing a few hours. Cow has a good appetite and is fed cured alfalfa hay. The only noticeable defect in the milk is a very little clotted milk in the strainer. Today for the first time the cream will not rise—the milk simply foams.—Subscriber, Corona.

Note that the milk becomes bitter after standing a few hours. This few hours standing has given microbes time to grow. Four kinds of germs are known to cause this defect. Also a variety of weeds, turnips and mushrooms modify the flavor of milk, but the abnormal flavor is noticeable from the time the milk is first drawn. Boil the strainer cloths and all utensils; clean the udder and teats before milking, using one end of a clean towel saturated with warm water which has been boiled; then dry with the other end of the towel. Use every precaution to prevent contamination of the milk (1) from the hands of the milker, (2) from the udder, (3) from the milk vessels, (4) from the strainer cloths, and (5) from the place where the milk is kept, cellar, pantry, etc.; and if the annoyance does not disappear, write again. The fact that the milk "foams" indicates fermentation due to contamination by microbes.—F. G. M.

"Give me not scenes more charming,
give me eyes
To see the beauty that around me lies,
To see the shine of souls, see angels
shy
Among the faces of the passers by.
I do not ask for sweeter music than
The common daily Symphony of Man."

Profit in the Poultry Yard

Practical poultry people who may have ideas from their experience as to methods of feeding and housing and general care of poultry will confer a favor upon the Cultivator and its circle of readers by sending in concise accounts. Mrs. Basley is always willing to answer queries, which with the experience of others should make this a most valuable feature in poultry life on the Coast. Opinions or matters of a personal nature should be omitted, but a concise statement of facts is always valuable.

WHEN TO HATCH EGGS.

(Continued)

By Mrs. A. Basley.

Recently we considered the subject When to Hatch Eggs, and decided that eggs could be hatched in California whenever biddy wants to set, which may be any month in the year. Eggs, however, are more fertile at certain seasons than others. Spring time being nature's time for hatching, is the most certain time of having fertile eggs, and of course, when eggs are not fertile there is no use in attempting to incubate them.

Infertility of eggs at this season of the year is the reason why so few persons attempt to hatch now. The market price of eggs is so high that one does not like to lose a whole incubator or even a few settings under hens by trying to hatch them.

There are many reasons for eggs not hatching, as I have already said. Of course, the first of these is infertility of the egg. To have fertile eggs is the first consideration. Fertility can only be attained by having vigorous and healthy fowls that are fed for fertility. There is, however, a difference between fertile eggs and hatchable eggs. You may get fertile eggs but not hatchable eggs, and it is the hatchable eggs that we all want. To illustrate my meaning when I was visiting the Gardena Hatchery, a case of eggs was sent there to be hatched. The expert owner and manager refused to accept them. "These eggs are not hatchable," he said. They were narrow waisted, thin pointed eggs; they had too little protein in them. The expert knew by experience that such eggs would not hatch, and that there was no use of even trying to hatch them. The hens that laid those eggs had not been properly fed. They had not sufficient protein in their ration.

Feed your fowls for fertility; have them clean from lice, vigorous and healthy, give them plenty of grit to grind their food and make the egg shell, and then choose the eggs that are plump and well shaped, and that have good smooth shells. Examine them through your egg tester, and if you do not have one, take a roll of paper, or a roll of music. Hold the egg at one end and your eye at the other, let the sun shine on the egg and try to look through. If the egg is in a bright light, you will be surprised at what you can see. Reject all eggs for hatching that are thin-shelled, or those with thin places, or those that are freckled all over with thin spots, those that are chalky to the touch or are crooked, cracked or in any way misshapen. Set them aside to be used on the table. Do not attempt to incubate them. This may be a little more trouble at the commencement, but is a saving in labor all through the period of incubation, and a lessening in the expense of oil, besides giving more room for fertile eggs in the incubator, and more chance of a good hatch, as the infertile eggs chill their fertile neighbors and draw from their vitality. Therefore do not put eggs into the incubator or under hens without carefully selecting them.

Poultry keeping is made up of little things, and can so easily be ruined by the little things that I will add a word of warning.

Do not hold the egg when testing it so close to the lamp that it will heat it. The tiny germ of life in the egg is very tender and may easily be killed. For this reason I made a homemade tester out of a cracker box. I cut a hole the size of a half dollar just opposite the place where the flame of the lamp came when I set it inside the box. You can also use an electric light bulb in this home-made tester, in a very satisfactory way, and it is not so likely to heat the egg. I also found this box very handy for testing the eggs under setting hens. Eggs whether under hens or incubators should always be tested out. There are thousands of eggs lost or wasted every year through carelessness in this matter. An egg which is inefrtile and is for a week either in an incubator or under a hen, is perfectly good for food. It is simply an egg that has been in a warm place for a week. There is no germ in it. There never has been life in it, so there is no dead germ in it to decay. Infertile eggs keep fresh and sweet much longer than fertile eggs and those who are raising only for the market should keep no male birds in their flock and never have fertile eggs.

CALIFORNIA POULTRY SHOWS.

Modesto—Nov. 16-18, 1911. Modesto Poultry Association. Will Guyler, secretary.

Oakland.—Nov. 21-27, 1911. Alameda Country Poultry Association. Wm. T. Fros, secretary, Oakland.

San Diego.—Nov. 28-Dec. 2, 1911, San Diego Pigeon and Pet Stock Club. H. J. Gottesburn, secretary, Coronado.

Corning.—Nov. 29-Dec. 2, 1911. Corning Poultry Association, E. L. Randall, secretary, Corning.

Escondido.—Dec. 6-8, 1911. Escondido Valley Poultry Association. B. V. B. Lincoln, secretary.

Petaluma.—Dec. 6-9, 1911. Petaluma Poultry Association. H. R. Campbell, secretary.

Napa.—Jan. 4-6, 1912. Napa County Poultry Association. Wallace-Rutherford, secretary.

Santa Ana, Dec. 27-30. Orange County Poultry, Pigeon and Pet Stock Association. S. J. Jackman, President.

ORANGE COUNTY POULTRY ASSOCIATION.

The Orange County Poultry Association is out with premium list and rules covering its annual exhibition to be held in Santa Ana, December 27 to 30. The booklet has fifty-two pages and cover and gives a list of all regular and special awards and coopage of the coming show; turkeys, ducks and geese, 156; general poultry, 1,104,-bantams and pigeons, 400; total capacity, 1,660. This will make a good big show, and we doubt not the capacity will be reached, for Orange County has a remarkable number of poultry fanciers. This book has also a review of Orange County's resources and gives notes as to its desirability as a poultry producing section. It claims for Orange County a grand total of poultry and egg products for one year of nearly $1,500,000, or, to be more exact, $1,452,-522.10. We predict a successful show for the Santa Ana boys.

POULTRY AS A BUSINESS ENTERPRISE.

A Santa Clara county poultry booster recently made an address in which he said:

"We turn out for market broilers, fryers, soft roasters and old hens and roosters when their work of egg production and breeding is done. We produce eggs of different sizes and colors, most of which are marketed fresh, while others are preserved during low prices and sold when eggs are higher.

"All of these have to be marketed to the best advantage, by disposing of each at the right time and through the proper channels. To get the best possible returns for everything produced by a poultry plant requires thought, foresight and considerable hustling to make the full profits to which the producer is justly entitled.

"A full knowledge of market conditions and the production of the finished product to be marketed when prices are high is essential.

"In all kinds of successful manufacturing, the selling end of the business is carefully looked after by those trained to find the market and dispose of the goods. They have their men on the road selling, in competition with others in many places, but always on the look-out for some place where the competition is less keen and where they can sell at better prices.

"In the disposal of poultry products we can learn much from the successful drummer.

"While it is true that good poultry and eggs sell readily at a good profit, the instances where a poultryman's product is well sold with little effort on his part are comparatively rare. Take the marketing of eggs for instance. The best market in California is in San Francisco and around San Francisco Bay.

"We may justly congratulate ourselves on being located within fifty miles of the greatest consumers of eggs and poultry on the Pacific Coast. Think for a moment of the number of eggs and tons of poultry required to supply the steamships and sailing vessels passing through the Golden Gate; of the poultry products daily consumed by the immense population around San Francisco Bay and the tremendous growth which must come with the completion of the Panama-Pacific Canal and its proper celebration by the world's greatest exposition.

"There is no danger of overdoing the poultry business. The question is, can we keep up the supply?

"Can we produce the required amount of good poultry and large eggs?

THE NEGLECTED GUINEA FOWL.

The guinea is a beautiful fowl, but as it has not a beautiful voice, is semi-wild in its habits, and has shown a comparatively slight plasticity, limited chiefly to color, it has never become popular. It will probably in time become more completely domesticated, and with such domestication may show a greater tendency to vary; but its voice will probably never lose its raucous quality. It is not likely for many years to come that the guinea will become a fancier's fowl. But the guinea fowl is not without economic merits, and the better these become known the more popular will the bird become among those who keep poultry for practical purposes. It is probable that the guinea fowl will be less neglected in the near future than it has been in the recent past.

An analysis of its flesh shows that the meat is richer in muscle forming constituents, protein, than that of the common fowl, turkey, duck or goose, though with less fat or heat producing properties. And the flesh makes a fair substitute for that of game birds, is often cooked in the same manner, and is frequently served in hotels and restaurants. Among European epicures the eggs are considered a great delicacy, having a rich flavor comparable to that of the highly prized plovers' eggs. In our Southern states the cooks generally believe that they are superior to the eggs of hens for cake making and similar purposes, because the whipped white is thought to be lighter. The eggs, though abundant, are small, weighing about 17 ounces to the dozen, while the eggs of hens weigh about 24 ounces to the dozen, and as the shell of the guinea fowl's egg is relatively thicker than that of the hen, the waste is larger in about the ratio of 17 to 11—or, to be accurate, the waste in giunea fowls' eggs is about 16.9 per cent, while that in hens' eggs is about 11.2 per cent.

The market demand for guinea fowls is increasing. There is now a fair demand for the birds in Eastern cities, and this demand appears to increase from year to year. As wild game birds decrease in number, it is reasonable to believe that the demand for guinea fowls as a substitute will greatly increase, which will affect not only the number of birds needed, but the prices at which they will be sold. And as the demand for their eggs increases, as it is likely to do, these delicately flavored eggs will rise in price. So that the market outlook for the birds and their eggs is very favorable.

THE CHICKEN MITE.

There are two kinds of chicken mites, first the common chigger, scientifically known as the Trombidium holosericeum, and, second, a mite about the same size but with an ovipiriform shaped body instead of an oval one, as in the case of the first. There are also some other microscopic differences. This latter parasite is scientifically called the Dermanyssis gallinae.

There has been considerable trouble with this first named parasite during the present summer, which will extend into the fall. The hot, dry weather is most favorable for their multiplication and development. Many birds (principally hens) infested by the chigger, have been brought to this laboratory during the season. The statement from these poultry people invariably being that the birds die suddenly, and, when opened, all organs appear normal, at least so far as they could tell. Those examined in the laboratory have proved the same. Further examination reveals the fact that the cracks and crevices of the poultry houses, as well as the cracks and crevices of the roosts and the nests, were literally alive with these little pests, which are about the size of a pin head. When full of blood they appear somewhat red or bluish.

These chiggers are blood suckers. Their piercing apparatus is cone-shaped, and with this they wound the skin and suck the blood. Imagine 500 to 1000 (as we have found them) of these, and imagine the irritation, and you will readily understand why the birds die. The irritation which each produces at the point of attack is considerable.

The birds often die suddenly without many visible symptoms.

The parasite lays its eggs in the cracks, crevices, and in the filth of the hen house, where they hatch out, first into an asexual, six-legged state; later moults and develops into the eight-legged or mature state.

To rid birds and premises of these mites it is necessary to thoroughly clean the building, including nests. Repeat this every two or three days, if not every day. Spray with two per cent solution (in water) of kreso, creolin or zenoleum, forcing the solution into cracks and crevices, and repeat twice a week. Pour coal oil on the roosts twice a week. Place one inch of air-slaked lime in the nests before placing new straw. Place in dusting wallow a small quantity of tobacco dust, sulphur and pyrethrum (insect powder.) Dust hens with same if found necessary, or dip with five per cent solution creolin, kreso or zenoleum.—B. F. Kaup, Colorado Agricultural College.

TAINTED EGGS.

It is a theory long since proved by facts, that dirty or foul water will taint the eggs as quickly as anything and hence, apart from the necessity that pure water is to a fowl's health, it is also a necessity if one would ensure fresh tasting and good quality eggs, says Maritime Farmer. Fresh water must be given daily; in winter before the fowls come out in the morning, so that they will not have old or soiled water for their morning drink; and in summer when the birds are up before their human attendants, fresh water should be given the last thing at night. From now till the end of autumn all water vessels should be placed in the shade; sun-warmed water is very injurious to the birds, and anything that affects their health affects the quality, if not the quantity of their eggs. One of the greatest aids to the desirable richness of egg and yolk is to feed the laying hen on an abundance of fresh green grass, clover, or lucerne, chopped and given to the fowls in their soft food. Plenty of green food is essential to the production of rich eggs, and though fowls on a farm may have no difficulty in getting this, as they usually have the run of some field or other, chopped clover should be given them several times a week in their meal food, as there is no feed more abundant in rich egg formation, and it also contains a large supply of highly nourishing properties.

As necessary as pure water and proper food is an abundant supply of grit and shell-making material. Fowls having no teeth, the food passes at once to the crop, or first stomach, without undergoing any change. From the crop it passes to the gizzard, where digestion proper begins. The gizzard is lined with strong membranes, by which, with the aid of grit, the food is masticated. The gizzard also secretes a powerful liquid that is capable of dissolving stones and other hard substances. Without grit in the gizzard the work of digestion is thrown on the liver and stomach, thus resulting in indigestion and liver disease. As a tonic I recommend charcoal, in the shape of burnt wood cinders. The dealer and consumer have great antipathy to thin-shelled eggs, and the egg of quality has not this fault. To avoid it the hens must be supplied with oyster shell or lime. Old mortar or plaster can always be obtained, and should be placed where the birds can pick it when they please. Under proper feeding conditions, a hen's system usually contains enough lime for the shells of five or six eggs. If lime is withheld, the hen will cease laying, or if lime in limited amounts is given, the shells will be thin in proportion. Old crockery broken up into small pieces, say the size of a grain, is the best grit that one can give one's fowls and it has the added virtue of being cheap and easily procurable.

POINTS TO REMEMBER.

It is said that baking powder placed in the drinking water two or three times a week will prevent bowel trouble among chicks. Charcoal, pounded fine and kept in the drinking water, is also good.

For the production and marketing of good eggs, it is well to remember the following:

Hens should be kept that produce not only a good number of eggs, but eggs that are of a moderately large size.

They should have comfortable quarters, be fed and watered regularly, and the nests must be kept dry, clean and sweet.

Eggs must be gathered daily. Twice a day in hot weather is best.

Never allow broody hens to stay on the nests. Remove them at once, and confine where they can be broken up.

Reject as doubtful all eggs from a nest which was not visited the day before. Such eggs can be used at home where they will be broken separately.

All extremely small eggs, as well as cracked and dirty eggs should be used at home. They are perfectly wholesome if used at once, but if allowed to stand, become unfit to use, and are discriminated against on the markets.

All summer eggs should be placed in as cool a place as possible, as soon as they are gathered.

Moisture should never be allowed to come in contact with the eggs.

All male birds should be separated from the laying hens as soon as the hatching season is over, until cool weather in the fall.

Eggs should be marketed at least once a week. Oftener, if possible.

Keep the eggs as cool and dry as possible while taking them to town.

Keep the eggs away from all bad odors. The shell is porous and easily absorbs any strong taint.

Use good cases and fillers.

One of the greatest mistakes the poultry raiser can make is to so neglect the hens that they do not lay and are only an expense. Give them a variety of feed, give them clean water, make them comfortable, and they will do more than their share in making money for their owner.

If you have fowls to sell it pays to feed generously on corn for at least ten days before shipping. Often the old hens will give a surprising lot of eggs while being finished off on this corn diet, but, as they are putting on fat rapidly, the laying is of short duration.

If your poultry houses are reasonably tight, it would be a good thing to burn some sulphur to get rid of the mites and lice. The tighter the house is the more thorough will be the effect of the fumes of the sulphur.

Avoid frightening hens, especially on very warm days. Any excessive exercise is apt to cause apoplexy, or at best will prevent a normal production of eggs.

Catalogues for the seed and nursery trade, the live stock and poultry industries, are a specialty with us. Two thousand illustrations to select from. Write for prices and samples. The Kruckeberg Press, 237 Franklin St., Los Angeles.

FARM LANDS FOR SALE.

The Best Bargain Yet—A good, well improved, money making farm of 56 acres, 2½ miles from Arroya Grande, Cal. A prosperous little town—no saloons. Five miles from Pizmo Beach, the finest beach in California. Free rural delivery. The house alone cost $2,000. Good barn and outbuildings. Fine roses. Walnuts and oak trees around house. Assorted berries and fruits. Plenty wood for fuel. Plenty of fine soft water. No irrigation required, consequently no danger of Bermuda grass or other foul weeds. Owner must have the money at once, hence the sacrifice. Price $6,500; $3,000 cash, balance two years, 8 per cent. Also an 80-acre tract of fine, level, loamy land, 50 acres of which is No. 1, in northeastern part of Santa Barbara County. Will grow alfalfa, vegetables, fruits, cotton, etc. No alkali or hardpan. Free timber 1½ miles away. Elevation 2,500 feet. No extremes of heat, cold or storms. Can be irrigated if necessary. $600 takes it. Same owner as above. Wm. T. Mantz, Maricopa, Cal.

Citrus Orchard—56 acres, all under cultivation, 670 lemon trees, full bearing; 716 orange trees, full bearing; 200 lemon trees 2 years old, 250 orange trees 2 years old, 60 Tangerines, full bearing; 2 acres deciduous fruit of all kinds, berries and small fruit. Good house of 13 rooms, finished in hardwood, basement. Barn and other buildings, well and windmill. Well for irrigation costing when completed $1500. Palms and flowers. Lighted with acetylene gas. In fact, it is the best ranch in the valley. Over 2000 shares of water stock. Price $37,000. Terms. F. J. Conrad, The Hustler, West Grand Ave., Escondido, Cal.

For Sale—LINDSAY ORANGE LANDS.
Eleven days before Christmas the fourteen packing-houses of Lindsay sent out pay checks for the 1910 navel orange crop. Lindsay orange district had the holiday orange market all to themselves, and of course they sold at good profit.
Why not invest in some of this Lindsay orange land and get the benefit of rapidly advancing prices?
Ten acre tracts in Lindsay, $150 per acre, on easy terms.
Choice Tulare alfalfa lands, water in abundance; any size tracts, $50 per acre up.
KIOUS-WHANN REALTY CO.,
235 Mason Bldg., Los Angeles. A 4164.

For Sale—
EXCURSION ANNOUNCEMENT.
SAN JOAQUIN.
Come join our low rate excursion to the rich and rapidly growing Merced County, where we will show you rich alfalfa, fruit and general farming lands, $65 to $125 an acre, with abundance cheap gravity water, and on easiest terms of payment. 17 first prizes won on agricultural products at last State Fair, hence the Blue Ribbon section of state. Ranchers Realty Co., 527 Grosse Bldg., Los Angeles, Cal.

For Sale—A 20-acre farm for $20 cash and $20 a month; possession now; $90 to $125 per acre; your crops pay for the land; rich, level land for alfalfa, oranges, almonds, grapes, cows, chickens; abundance of ditch water for irrigation for $1 an acre a year. Where else can you get this? In Oakdale Colony, near good town and railroad station. Climate delightful. T. Wiesendanger, 408 West Sixth Street, Los Angeles, Cal.

170 Acres—¼ mile from R.R. station and school, $30 per acre. 100 acres in crop; more can be planted to trees or vines. Partly warm citrus soil or for winter gardening; some alfalfa land; well 50 feet deep, 10 feet across, water 8 feet from surface; all under fence; no other improvements. Terms $3000 cash, balance at 7 per cent; will not trade. Address C. T. Haney, Escondido, Cal.

1920 Acres Alfalfa Land—One of the best subdivision or dairy propositions in the Sacramento Valley. 1,000 acres level bottom loam soil, two cow sheds, 400 head capacity, horse barn for 60 head, 10 room ranch house, blacksmith shop, hog sheds, outbuildings, etc. Well fenced and cross fenced, many corrals. Three miles from railroad station in Butte Co. This is an absolute bargain. Price $50,000. Very easy terms. Apply owner, Paul Goodloe, 1049 Phelan Building, San Francisco.

Choice Orange Land, Exeter District—63 acres, 3 miles south of the town of Exeter, California, three-quarters of a mile from Southern Pacific railroad station, right in the foothills, leveled, water developed on it. Write for particulars. The Phalanx Company, 513 Chamber of Commerce, Los Angeles, Cal.

For Sale— —$15 per acre
160 acres rolling land, good stock and grain ranch; 4 miles from Escondido; 100 acres have been cultivated, but now grown up to brush. Old shack and family orchard, good well bricked up, two springs, deep rich soil. Terms. Address C. R. Soults, Escondido, Cal.

For Sale—90 acres, ½ mile from good railroad town, in San Luis Obispo county, all in cultivation; good two-story residence, two good barns; fenced; improvements cost more than $4000. Price $6000; terms if desired.
W. L. CARTER,
A2400. 322 Byrne Blk., Los Angeles.

For Sale—Near Lancaster, Cal. Bargains in improved and unimproved land. Also relinquishments for sale or trade. Some homestead land. A. S. Burnham, Box 451, Lancaster, Cal.

San Diego County! My splendid weekly newspaper will tell you about this great county and superior climate. 16 weeks for 15c. H. P. Rising, publisher, Escondido, Cal.

FARM LANDS FOR SALE.

For Sale—

BUY

GOVERNMENT

LAND SCRIP

and avoid all doubt and interference in desert land entries and all matters of final proof.

No irrigation
No cultivation
No residence

By the use of
SCRIP.

The Government now has taken the ground that until there is an authoritative opinion by the Supreme Court of California as to the status of those holding water stock, all matters of final proof in pending cases will be suspended.

The General Land Office hold that, in view of the conflicting opinions of the California courts on the point at issue, the Stratton entry and all others similarly situated shall be suspended until a decision is given by the State Supreme Court governing the disputed points. The final proof in the Stratton land was made Nov. 22, 1907.

GOVERNMENT LAND SCRIP

is by all means the cheapest and most satisfactory method of securing public land.
Don't fail to call or write for our Booklet No. 14, which explains all about it.

FEN. S. HILDRETH SCRIP CO.,

PREPARING FOR FROST.

The orange and lemon grower who has not prepared for possible frost has no time to spare to get his order in for appliances and fuel. Severe frosts have been known to come as early as the first of November, but it must be admitted these are exceptional, but in December there is surely need of protection, for at least one year out of every two or three there is bound to be more or less cold which will prove injurious to citrus fruits. The Troutman Orchard Heater people have established an agency in Los Angeles, in charge of Mr. W. H. Fowler. Mr. Fowler is now taking orders and making consignments of the Troutman heaters to several sections of the state. This heater has been recognized as most effective, and some of the larger growers have depended upon it. The best way to handle the frost question is for neighborhoods to join in the work, for then the effort is far more effective than where a single orchardist labors with the problem alone.

Agriculture

CHEAPER AUTOMOBILES.

The day when the automobile could be regarded as the vehicle of the rich and prosperous exclusively—or when, if owned by a person of moderate means, and employed otherwise than in some regular business, its possession was held to indicate spendthrift habits—is rapidly passing away. The multiplication of great establishments for the manufacture of automobiles has proceeded so rapidly, and the number of machines turned out by them annually has become so vast, that the "upper ten" in society can no longer afford a sufficient market for the product; and manufacturers are turning their eyes toward the "middle thousands." There, after all, in supplying the needs of the farmers and middle-class townsmen, they are to find, hereafter, their largest rewards.

One great multi-millionaire corporation already announces for sale a "thoroughly capable" guaranteed car, rubber-tired, and "with powerplant that will run 35,000 miles" for $350—a figure which approximates the cost of a good "horse and buggy" such as almost every farmer has looked upon as entirely within his means. It is practically certain that the rivalry between manufacturers will lead to the immediate offering of even better cars for the same money, or of similar ones for a lower price. The farmer, then, finds himself now the heir and beneficiary of one of the most beneficial and revolutionary inventions of the age. He is to be the beneficiary of all the experimentation which has been done, at the expense of the rich, in perfecting and developing the "auto." The "devil-wagon," as he has been want to call the swift machine which scared his horses and made the roads so often unsafe for him, is transformed by the progress of manufacturing ingenuity into the vehicle of a good genius, with which—if he cannot, like Puck, "put a girdle 'round the earth in forty minutes,"—he can at least hie to his market town and get home again in minutes where it before took hours. It will also enable him to do an amount of pleasure-traveling, independently of the railroads, such as was before a practical impossibility. It will also, by practical bringing the farm closer to the market—and by giving in many cases a choice of markets—tend greatly to increase the value of outlying farms.

It was entirely natural that manufacturers should first cater to the class having the most money to spend, and that they should bend their energies to the production of vehicles which would, from the pockets of that class, for the time being, extract the largest prices. But now that they turn to "the market of the millions," they will find its opportunities incomparably greater than those afforded by "the market of the select few."—C. R. Barns, Extension Division, Minnesota College of Agriculture.

The first few streams from each teat contain very little fat, but very many bacteria. They work their way up the channel of the teat from without, and find ideal conditions for their rapid multiplication. If they are milked out on the floor, the gross yield may be slightly lessened, but the purity of the milk, so far as bacteria are concerned, will be greatly improved.

LILLY'S These 3 Vegetables for 10 Cents

This is not a bargain, but an introductory offer to get you interested in Lilly's Seeds, and to prove to you their quality and reliability.

LILLY'S "DELICIOUS" LETTUCE. A variety introduced by us, very early with fine, hard, medium-sized heads, rich yellow heart, with a delicious buttery flavor.

LILLY'S "EARLIEST OF ALL" RADISH. A very small, round, brought red radish with white, crisp flesh of a delicious, mild flavor. An excellent variety for cold frame.

LILLY'S "NEW WHITE QUEEN" ONION. A very early, small, round variety of fine, crisp flesh, with a deliciously mild flavir. A great favorite for the home garden, easily grown and matured.

The above three varieties are all regular 10 cent packages. We offer the three for 10 cents to introduce. Send money order or stamps.

CATALOGUE READY FOR MAILING, FREE.

Send for a copy of Lilly's Annual Seed Book, 126 pages, fully illustrated with cultural directions.

CONCRETE MATERIALS FOR FARM IMPROVEMENT.

The early settlers, colonists and pioneers encountered a trackless forest extending from the Atlantic to the prairies, the removal of which was necessary before they could create farming land. As the country began to be settled demand upon the forests was made for building material. A hundred years ago almost all agricultural structures, and buildings of all kinds in farming communities were constructed from lumber procured from nearby forests. Even a few years ago the farmer used nothing but lumber for farm buildings. The timber was cut from his own land and sawed at nearby mills, so that his own trees were converted into his troughs, dairy houses, walks, fences, and even his house and barn; hence the high price of lumber consequent upon the rapid decrease in the country's timber supply, was felt last by the farmer, though now the demand for a new building material is nowhere more keenly felt than on the farm.

Such a material has been found in concrete, which in some instances has proved superior to lumber, brick, or building stone, and is being used for all kinds of farm structures from silos to sidewalks, and stables to dwellings. This material too, like his lumber, can generally be largely produced from his own or nearby land, as nothing but the cement and metal bars for reinforcement need be purchased from afar, and much of the work can be done by the farmer and with ordinary farm labor under the direction of a skilled concrete worker.

Frequently concrete users have made costly mistakes by not informing themselves properly, before starting their work, concerning the correct methods of making good concrete. As a guide in the selection of the proper materials, especially the sand and gravel which form six-tenths of the solids used in concrete, the U. S. Department of Agriculture issued Farmers' Bulletin No. 461, containing suggestions which should be observed.

Concrete is manufactured stone formed by mixing cement, sand and stone or gravel (i. e. pebbles) together with water. The cement is but a small part of the mixture, and is the product of skilled workmen under the supervision of the manufacturer who must compete with all other makers of like material; but the sand and gravel constituting one-third or one-half of the final product must be selected and prepared by the farmer, and this is where most failures originate. Various amounts of each are used, according to the use to which the finished product is to be put. The mixture in which all the spaces or voids between the stones or gravel are filled with sand and all the spaces between the grains of sand are filled with cement is the ideal mixture. The ideal is seldom attained, but the bulletin gives detailed instructions and instructive illustrations, which should go far towards enabling the farmer to closely approach it.

AUTO AND THE BOY.

We note the following bunch of wisdom in an exchange:

Among the many wonderful achievements that the modern automobile is bringing to pass is the solution of the farm and the boy problem. In the mind of one motorist, at least, this invention of man will unlock the mystery as to how to keep the young men from forsaking the country home in order to live in the city.

Man is a gregarious animal. He loves to mingle with his fellow kind. He dreads isolation and solitude, consequently he hunts the place where the greatest number of people congregate in the smallest place—the city.

Here he gratifies the inborn instinct to rub up against his fellow man to his heart's content. Sometimes he smoothes off the rough edges and becomes a polished magnate, and is heralded from one end of the land to the other as a farm lad, born on the farm—country bred—one who has raised himself from obscurity to the pinnacle of fame.

Few Reach Fame.

But cold facts show that the rank and file of the country lads who migrate to the city merely fill in cogs of corporation machinery, wheels which keep grinding away with the same monotonous regularity year after year. This is what the city offers to the average youth. There is none of that free and independent spirit which distinguishes the country cousin from his city relative. He satisfies his longing to mingle—but he also learns more cussedness in six months than the pure air country boy could learn in a lifetime. While many boys leave the farm because they are gregarious animals, nine out of ten do so because they lose interest in the farm.

The lack of proper recreation has been offered as the reason he loses interest in the country. It is considered a tough proposition to toil all day in the broiling sun, and at night, after the chores are done, to lounge around until bedtime.

Auto Gives Recreation.

A local dealer in automobiles has given this subject great attention, and since his trade has largely been among country people, he believes that the motor car will be found by every parent confronted by this problem as the sure remedy. This is just the kind of recreation the country lad needs. It makes the eye sparkle and nerves tingle with joy and excitement. There is exhilaration in being behind the wheel, in operating the brake, clutch, spark and gas control.

The average country youth is quick to pick up the knack of handling a car, being familiar with machinery. It also creates an interest in good roads which is necessary for every farmer. When he returns from a spin the tired feeling is gone and he thinks life is worth while.

He gets to travel sections of his own territory which he never saw before, he can easily run into town as often as he pleases, and after the season's work is over and before winter comes he can take long tours over the entire land.

The automobile breaks the last thread that separates the farmer from the city, now that he has the telephone and free rural delivery.

A STEEL TOUGHENER.

Remarkable claims are made for the toughness added to steel through the use of small quantities of the metal vanadium, according to a report of the United States Geological Survey. It is declared that after treatment with vanadium, steel has great resistance to the strain, or as it is termed the fatigue, caused by constant bending.

Look for goodness, look for gladness,
You will meet them all the while;
If you bring a smiling visage
To the glass, you meet a smile.
—Alice Cary.

Rayo LANTERNS

"Light Work"

There is no needless delay about putting the horses up for the night and getting into your own comfortable home when the work is lighted—and lightened—by a Rayo lantern. Rayo lanterns give such a strong, steady light you can put your hand on what you want in a second.

Rayo lanterns are the best and brightest on the market.

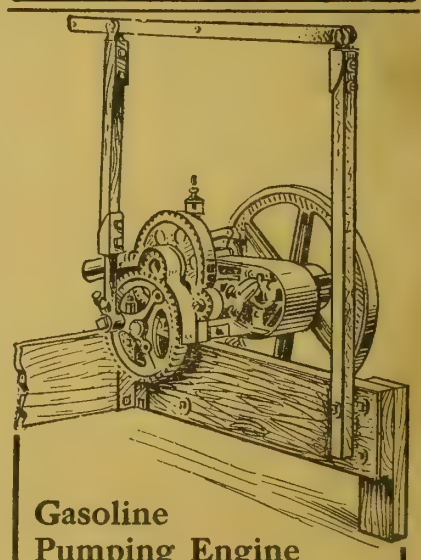
Made in all kinds of styles and sizes, to suit any use.

Finest material and workmanship; most light for the oil consumed; will not blow out.

All Rayo lanterns are equipped with selected Rayo globes, clear, red or green, as desired. Wicks inserted in burners, ready to light.

Dealers everywhere; or write for descriptive circular direct to any agency of the

Standard Oil Company
(Incorporated)



Gasoline Pumping Engine

Complete Ready to Operate for

$42.50

These air-cooled Pumping Engines will pump the same quantity of water as an 8-ft. windmill. They will pump any or all the time, whether the wind blows or not. They are sold complete ready to operate, are easily set up and will give entire satisfaction for years if properly oiled. About one pint of gasoline in four hours is required.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper, and sign full name and address. Unsigned communications receive no attention.

Varieties of Peach.

Please give list of most suitable canning peaches, also list for table use.—Subscriber, Highland.

The Lemon, Phillips and Tuscan Clings are probably the principal canning peaches in this state. Also the McDevitt is said to be one of the very best of canners. Runyon's Orange Cling is another favorite with the canners. If freestones are preferred, the Elberta is one of the very best. Foster, Crawford and Lovell are all favorites. For table use Briggs Red May, Alexander and Hale's Early are popular with the early planter. The Foster, Elberta, Early Crawford, Late Crawford, Muir and Lovell, Salway & George's Late Cling are all good table varieties and ripen in about the order given from the last of May to the last of September.

Applying Lime.

Please tell me the best form of lime to put on ground of orchard or garden. What results can be expected from it? How should fresh lime be prepared? What is value of wood ashes and gypsum?—Subscriber, Glendora.

The best form of lime, at least that in which there is least danger of injury, is pulverized lime rock unburnt. If quick lime is added to the soil without thoroughly slaking there is liable to be loss from burning out of humus. If the fresh lime is the only available form then be sure it is thoroughly air-slaked by exposing sometime to the atmosphere. This is the more expensive method of applying and those near a sugar factory can secure safer and better lime in the factory waste lime.

Results to be expected are that if ground is very heavy and close it is flocculated and made looser and more workable. It also makes available the fertilizer in the organic matter in the soil and in a sense aids in more rapid lowering of the fertility content of the soil. Most California soils have abundance of lime and on the lighter and sandy soils care must be exercised in applying it. Wood ashes is one of the best fertilizers, especially where potash is needed. It may contain as much as five per cent actual potash; also small percentage of phosphoric acid and a large proportion of lime. Gypsum is of value in case black alkali exists in the soil. It will reduce the black to the white alkali which is more soluble and more easily washed away. It is also an excellent absorbent about stables and is spread over compost heaps to preserve nitrogen and prevent loss by evaporation. As a direct fertilizer it has no value, but does make available the potash in the soil.

Weevil in Bran.

Have a quantity of bran which has been kept in metal container but has a number of weevil in it. Attempted to kill them by use of carbon bisulphide, but had only a small quantity to use and find that there are still weevil living. Is it dangerous to feed this bran to cattle or horses?—J. G. S., Richgrove.

There is no danger from feeding this bran because of treatment with carbon bisulphide if it has been exposed in small dishes placed over the bran and the fumes only allowed to work their way through the mass. When exposed to the air for a few moments the fumes are entirely dispersed. As to feeding bran infested with weevil, we have never heard any objection.

Best Breed.

I will not ask you which is the best breed, because I notice you always say that there is no best breed, and that you advise inquirers to choose the breed they like the best, but I would like to ask you to tell me which breed you are keeping, or did keep when you were in the poultry business yourself, and what were your reasons for keeping that breed."—Mrs. J. F. Y., Los Angeles.

I have kept at different times twenty-two or more different breeds, but when I was in the business for money I kept the White Plymouth Rocks. I am very fond of all varieties of chickens, and each breed has its special good qualities. For that reason I always say to inquirers, "Choose the breed you like best," because they are more likely to succeed with the one that they know and like rather than one recomemnded to them by someone who may not know their tastes and inclinations. I loved them all and used to think that no layers came up to the Leghorns. I noticed that when any breed is especially recommended as an egg layer, it was said "They lay as well as the White Leghorns," showing the undisputed superiority of the Leghorns as layers. For me, they laid well. They knew me, were perfectly tame, flying on my shoulder, arms and hands, but whenever a stranger came near they would scurry to the other side of the yard in perfect terror. If even a cat walked along the fence they were wildly frightened, and whenever they were frightened it had a deleterious effect upon the egg basket. Then again, they would fly over any fence and were restless and nervous. These to me were their faults, also my family preferred brown eggs, and the Leghorns lay white eggs.

Being very partial to white fowls, I thought I would try the White Plymouth Rocks. These I found had gentle, quiet dispositions; they were fine layers of a good sized brown egg. They dressed better for the table than their darker cousins, the Barred Rocks. They were almost non-setters, but when occasionally one would set, she made as good a mother as the Barred Rocks, and a ten years trial has proven to me that they are equalled by few and excelled by none for table quality and for egg laying. They are a large fowl, so that when their days of usefulness as layers are over they bring a high price as market fowls. They have a yellow skin, which is much desired in the American market, and being one of the American breeds, are extremely hardy and readily adapt themeslves to any climate in the United States. I have successfully exported them as far as the Philippines and New Zealand, and they did equally well in those climates. Some very fine flocks of these birds are now kept in Los Angeles and Southern California. They are equally adapted for town lots or for country farms. They are good fall and winter layers. Anyone who has once kept them will be very reluctant to give them up.—Mrs. A. B.

MILK STRAIN

Petaluma Cal

Self Milker.

We have a request for information as to preventing a cow from sucking her own milk, and from an extended article on that subject by Mrs. Sherman in the issue of the Cultivator of October 28, 1909, we take the following extracts:

"This vice is said to come to cows that are staked and lack water to drink. Prevention is not easy, for any means adopted are apt to interfere with the cow's eating, sleeping and licking herself clean. One device tried was a hollow bit. This was soon discarded, as the cow could not eat well nor chew her cud and lost flesh rapidly. The next thing tried was the common bull ring in the nose, with two smaller bull rings hung on it loosely. This proved no good, as the cow managed to tangle the hay on it and it interfered with grazing. Whatever is used on the cow, we must remember she is one of the most awkward of animals, as well as most persistent, and she must be guarded from injury. A corslet of barrel staves was also tried around the neck. A short staple was driven in the upper end of each stave, the square corners rounded off, and a malleable heavy iron wire passed through the staples, the ends of the wire turned into rings, and a hame strap used to buckle the affair around her neck. This worked on all except one cow, who managed to get half over on her back and twist to reach her udder. She caught herself one day, and nearly died before released. Splitting of the tongue is efficacious, but in many cases the cow loses the ability to roll her cud."

Pruning Oranges.

Writers tell me to prune in winter for wood and in summer for fruit. Will you tell at what stage of growth the orange and lemon should be pruned? Am told that the lemon makes three growths during the year. —Subscriber, Pasadena.

This would lead to rather too extended discussion, and as we have in preparation by one of the best writers on orange culture in the state an article on pruning, we will defer answer to the above until that article appears. The present is hardly the time for pruning the orange in any case.

Grapes Splitting.

What makes Flame Tokay grapes split open?—Mrs. M. B., Lakeside.

This is perhaps due to moist weather. It is a trouble which usually follows every rain, and as weather conditions cause it, there is no remedy but different weather conditions.

Plowing Under Green Manure.

What is the best plow for turning under green manure growth? Would especially like one which will go close to the trees.—Subscriber.

Some prefer the disk plow, others the mold board plow. If a heavy chain is put over the beam of the mold board plow to the outer end of the doubletree, it will take under the heaviest growth. We must say, however, that some orchardists prefer the disk harrow. The green growth is planked down, and then, with disk harrow driven at right angles to the direction of driving when planking, the growth is cut up into small bits and mixed with the surface soil. We believe that the general feeling is favorable to a deeper covering than this gives.

Icing Cars.

Do the express companies charge a through rate for icing cars or is each re-icing charged separately? What is charged per car for pre-cooling oranges? Do the express companies pay the railway per mile for hauling their cars?—Subscriber, Colton.

Our subscriber is laboring under a misapprehension as to the express companies having to do with orange shipments. Formerly one line of refrigerator cars was called the Fruit Express, but that was not an express company in the same sense as the Wells Fargo and other express companies, which send small parcels. Under the present law the railways must own their own refrigeration cars, so that the former arrangements with the so-called Fruit Express and other privately owned car lines have been terminated. The icing charge is $75 per car to New York and $62.50, we believe, to Chicago and some other "Western points." Others carry a $60 charge, etc.

These icing charges, however, are diverse according to circumstances. There are three pre-cooling plants owned by growers; one at Pomona, one at Upland, and one at East Highland. If these houses precool their fruit and ice it, it is carried through at the rate of $7.50 which is considered freight on the ice which the private shipper has put into the car. This charge was formerly $30, but was reduced to $7.50 by the Interstate Commerce Commission. If the car is precooled by the carrier, that is, by the railroad company, and filled with ice at the starting point and not re-iced, the charge is $55. In this case the minimum weight of fruit in the car is 32,000 pounds; otherwise it might be the usual minimum of 26,600 pounds. If precooled by the carrier and not iced, then the charge is $25. If the car was pre-cooled and iced at the starting point at the charge of $55, but in transit the fruit is found to be suffering and in need of re-icing, then the $55 charge is cancelled, the car is iced and a charge of $75 made. This is assuming that it is going to Atlantic Coast points.

Black Scale on Olives.

Is there a spraying material which will rid olive trees of black scale? If not, what remedy will "completely abolish" the pest?—Subscriber, Loomis.

The best treatment is fumigation. Perhaps in your section there may be no tents for this purpose, so that unless you have a large orchard it would not pay to fit up for it. In that case spraying with kerosene emulsion, whale oil soap solution or other remedies given in the Cultivator of November 3rd, 1910, will greatly reduce the pest. To "completely abolish" is hard and expensive, even with fumigation.

Fumigating Lemons.

How often is it necessary to fumigate lemon trees which are badly infested with purple scale? What is the proper dosage? What is the latest government bulletin on fumigation?—Reader, San Diego.

The dosage table given in the Cultivator of August 19, 1909, will give purple scale treatment; also the bulletin by R. S. Woglum issued by the Bureau of Entomology as Number 90. It is impossible to give the dosage without knowledge of size of the tree, for the smaller trees take a larger proportionate dosage than the older ones. So the best answer is to give the full table which may be found on page 33 of the bulletin referred to. Later bulletins touching upon fumigation carry the same number, that is, Bulletin 90 is issued in three parts. Another work which will be of value is Circular Number 50 of the State Agricultural Experiment Station at Berkeley. It touches upon fumigation scheduling. Prof. Woodworth has also issued Bulletin 152, Fumigation Dosage. This was published several years ago and before Prof. Woglum's investigations. Once each year should keep the pest in subjection.

Household Department

WHEN THE SUN GOES DOWN.
By Will F. Griffin.

I have wondered what lies past the world's far rim,
Where the great red sun goes down;
Since the dreaming of youth, so long ago,
I have longed, so longed, sometimes to go
Over the slopes and the mountain trails,
The deserts and valleys, the woods and vales,
To the land where the sun goes down.

I have looked in the desolate, tinted West,
Where the great red sun goes down,
And wondered at strange and foreign lands,
Of unknown tongues on foreign strands,
And longed, so longed, sometimes to go,
That I might see, that I might know
Of the land where the sun goes down.

I have looked in the far away jeweled skies,
There where the sun goes down,
And longed for the deeps of a starry night,
A trackless waste and a Pole star light,
And wished that I had been born to see
Those lands and know of their mystery—
There where the sun goes down.

And I've turned, in the dusk, from the afterglow,
After the sun went down,
To the lights that gleamed in the city's heart,
The lights in hall and throbbing mart,
And longed, so longed, for the arms and breast
That cradled me sweet to sleep and rest,
After the sun went down.

—San Jose Times.

WHO WILL GO A-MAYING?

Friendship is a flower which partakes of the beauty of cultivated blossoms and of wild flowers.

It must, to approach perfection, be the outgrowth of the natural tastes. If these are chastened and rendered more highly responsive by culture, the delicate lossom of friendship will yield a rare perfume.

In May we go seeking for flowers. Put on your garden hat, the one which is browned by the suns of two or three summers, the one that seems part of you when you wear it, and come with me. There are many lovely things to be seen on the way, as we search for the flowers of friendship. And after we have found them, what are they?

Some of these plants are frail and require careful watching. The harmful enemies that may prevent the glory of full blooms are many. Jealousy, differences about money, the separations of time and place, all these things make for their destruction. If these hindrances are resolutely guarded against and the flower of friendship bursts into loveliness, shall we not cherish it?

Pleasures which come to us in no other way we may find in our friendly affections. There is often community of spirit. Nothing partakes less of the limitations of our earthly life than sympathy in high ideals.

If a friend is once enclosed within the sacred precincts of our hearts, there should not be too great a difference to us in the interests which we feel in his affairs and in our own. Are not the griefs, the illnesses, the successes of that friend very close to us? Is not his spiritual life of import to us, and his welfare in a measure our own?

If we enjoy together the great poets, those undying voices who have left proof of the winged powers of mind and spirit, then beauty has been added for both of us to that glittering, star strewn robe of wonder which each noble intellect throws over the sordid features of life.

There are many boulders of every day life to obstruct the course of the limpid stream of friendship. But they may also lend to it a charm. If our friend believes an unkind criticism of us which for a time seems to separate us from him, it may offer us an opportunity to be forgiving. And when the old cordiality returns may we not find that the ensuing depth of kindliness, the still pool of mutual confidence, is deeper and calmer than before? The glistening rapids of temper, hasty words, quickly forgiven, add movement and foam to the course of the flowing friendship.

The Maytime of youth fosters the making of new friends. The heart opens easily. A confiding spirit has not yet been replaced by too much forethought.

But this May day hurries on, and we have not yet enjoyed our bunch of flowers for which we came a-Maying. If, perchance, a later flower has found a place among those of spring, let it stay.

Here is the forget-me-not. It is the friendship of a baby. The blue, unassuming flowers hold the heart like the eyes of a very little child. Nothing is more tenacious in claiming the affections than the eyes of a baby. They speak, even though the little lips are quiet. They hold out to us the crystal drink of heaven, in earth's fragile cup.

This sweet June rose stands for college friendships, because memories of commencements are in its haunting fragrance, recalling moonlight nights of June, high resolutions and parting words after four years together. And out of the pleasant bonds of college days grows the lifelong, trusty dependence of the two older men, who meet after months or years of separation, with a deep understanding of the heart needs and the intellectual point of view, each of the other.

The tuberose is the friendship which has been, between one who still lives and one who has gone to the realms of deathless asphodel. Its odor is too heavenly sweet. Let us turn aside to this other blossom, which is of the present and full of pulsing life, and which yet partakes because of its ineffable and passionate quality of the strange and searching waftures which come to us from the fields of death. It is the flower which embodies the friendship of lovers. For lovers may also be friends. As I look closely at this blossom I cannot distinguish its form, color or fragrance. It is wonderfully beautiful. For each person it is, perhaps, different. If we look too intently, it fades from view.

The friendship of an invalid is like a violet, that lowly flower which grows close to earth. The air around it is made sweet, as are the souls of those who surround a patient, gentle invalid who, like the violet, must live bound close to earth, but with petal wings spread towards Heaven.

The light of this May day is fading, and the other flowery friendships which make up my Maytime cluster are hardly to be distinguished.

One of them, I know, is the tender love between mother and daughter. Another, the strong comradeship mingled with sentiment which draws together father and son. And there is a roseate, delicately veined bud just opening which recalls the friendships of young girls.

Do not let these flowers drop wilted from your hand! Do not let the plants of which they are the crown and glory fade away.

The stars bloom out in the soft sky. The dewy evening draws on. Let us go.

AT THE LUNCH COUNTER.

Said a bald headed man to a waitress bold:
"See here, young woman, my cocoa's cold!"
She scornfully answered: "I can't help that;
If the blamed thing's chilly, put on your hat!"

—Success Magazine.

ABOUT THE SIZE OF IT.

First Bunko Man: "Do you believe there is any truth in the old saying that a sucker is born every minute?"

Second Bnuko Man: "Well, I don't know as to that, but they are born often enough to keep us wise guys from becoming honest."

How much can you get from the basket?

It isn't so much what you pay for food, it is how you use what you buy. Food economists have found the

ENTERPRISE
Meat and Food Chopper

to be the greatest of kitchen aids. Every day finds a new use that means better dishes at less cost.

Built on honor—to last a lifetime. The one right cutting principle. The Enterprise does not shred the meat and vegetables, but *cuts*. Four-bladed steel knife revolving against the surface of a perforated steel plate shears the material into bits that retain all of their juice and flavor.

45 styles—hand and power. Small family size (No. 5) $1.75; large family size (No. 10) $2.50.

Every machine that bears the Enterprise name—Fruit, Wine and Jelly Press, Coffee Mill, Raisin Seeder, etc., is the best that you can buy.

Enterprise Sausage Stuffer and Lard Press—patent corrugated spout prevents air from entering casing.

The Enterprise Bone, Shell and Corn Mill quickly pays for itself in increased egg yield.

Meat Sausages

2 cupfuls of chopped meat (left-overs may be used), cost not over	12c
½ cupful pork	3c
Yolks of two eggs, lemon juice, thyme, pepper	4c
Total cost	19c

Enough for five. Cost per person, 3 4-5 cents.

Send 4 cents in stamps for our recipe book, "The Enterprising Housekeeper." Tells how to make 200 economical, tasty dishes.

HOW MUCH FRESH AIR?

Fresh air, and especially fresh air in the bedroom at night, has by dint of incessant warning and preaching at last become the goal of all thinking people.

Hygiene is so powerful a goddess today that even custom and fashion must bow down to her, in theory if not in practice. There is danger here, for when people begin to credit themselves with virtues they do not possess, or to mistake decent theories for proper practice, they cease to advance in wisdom or health.

Some people take to the fresh air only as a timid bather takes to the water. They have heard that it is good for them, and they think that they think it is; but in reality they detest it, and regard it as full of threat and peril.

In a cross-examination of any dozen people, as to what each regarded as a ventilated bedroom, the results would vary from a room too cold for a self-respecting St. Bernard dog to sleep in, down to one which air leaked in from an open crack in some adjacent bathroom or corridor.

Sometimes inquirers show by their questions that they really desire to do right, hygienically, if only they knew how to begin. For these there is a motto for their banner—"Be bold, be bold, and evermore be bold-"

What constitutes bad air in a bedroom? The answer to this is, any air that has been rebreathed.

To what extent should the window be kept open in cold weather for one in ordinary health? The answer to this is, to the same extent that it should be kept open in all weather, and in all states of health—wide! Furthermore, when it can possibly be managed, window should be spelled with an "s." Fortunate is the sleeper who has one on at least two sides of his room. Let such a person fear no drafts, for these are the friends of mankind. Bad air and drafts do not live together. Neither do colds and drafts, hard as many people find it to believe this.

It is not wise to feel cold, neither is it necessary. It stands to reason that with wide-open windows in winter, warmer coverings will be needed. A properly ventilated bedroom will be of the temperature of the outside air, or very nearly so, and summer blankets will not avail. It also stands to reason that if one covers the head for exposure in the daytime, one should do the same at night. A soft cap made from a Shetland veil lined with silk, and made to pull over and down to the brows, will be found a most luxurious nightcap.—Youth's Companion.

REVISING THE NATIONAL ANTHEM.

At the request of King George the venerable Dean Hole has been revising the British national anthem in order to bring it just a little more up to date and in harmony with the modern spirit. The dean has improved it materially as far as he has gone by substituting lines in the stanza reading "Confound their politics, Frustrate their knavish tricks," so that the revised version reads beautifully as follows:

O Lord our God arise,
Scatter our enemies,
  Make wars to cease.
Keep us from plague and dearth,
Turn Thou our woes to mirth,
And over all the earth
  Let there be peace.

Certainly this is unexceptionable, but we think the dean has not gone far enough, and to remedy his omissions we venture to suggest the following additional lines, which we respectfully submit to the distinguished consideration of His Majesty:

Please cork up Bernard Shaw,
Keep us from saying "Aw!"
  When we converse.
Give English clothes some shape;
Make Punch a funny pape;
Show us how to escape
  A. Austin's verse.

In any future pinch
Renew our ancient cinch
  On Yankee cash.
May Uncle Sammy's girls
With their stocks, bonds, and pearls,
Still help our dukes and earls
  To cut a dash.

Other stanzas ad lib. suggest themselves, covering the present plight of the House of Lords, the dangers of Canadian reciprocity with the United States, and other prayerful considerations affecting the current needs of the empire, but we prefer to hold them over for our special seventy-two page issue devoted to the question of the annexation of the British Empire to the American Republic.—Harper's Weekly.

WINDOW CLEANING HINTS.

It is possible to reduce window cleaning to a science so it takes little time and less drudgery. It pays to learn how to clean glass most expeditiously.

Choose a time when the hot sun is not shining directly on the glass for window washing, or the panes will be streaked. A cloudy day is excellent, or the part of the day when the sun is off that side of the house.

Wipe off all the dust first with a dry cloth. Have all your polishing rags and ingredients at hand. These consist of tissue paper—old patterns do nicely—a newspaper, a piece of chamois.

Do not fill a bucket with soapy water and go to work as if out for a Monday wash. Do not use soap at all. A tablespoonful of ammonia or two tablespoonfuls of kerosene to four quarts of hot water will do the work much more quickly and give a better polish.

Rub one pane at a time, first inside, then out. Wash with a rag not so wet as to slop on the floor, then wipe off with tissue paper or newspaper and give a polish with the chamois skin.

There are special pastes sold for window polishing which are excellent. Professional polishers use a mixture of whitening and household ammonia reduced to a thick paste. This is kept on the glass for about ten minutes, while the other windows are being smeared with it, then is rubbed off with newspaper and is polished highly with chamois.—Aunt May.

HOMELY HINTS.

Towels and other household articles of the same sort often show thin places, which are precursors of holes, and which should be mended before they get worse. Darning a Turkish towel by hand is a tedious affair, but they can be darned on the sewing machine easily.

Remove the presser foot and darn the thin places by moving the towel backward and forward, then turning it around and darning it across.

This is a plan which will work well with any of the household fabrics, and if done in time will save a large hole from forming.

If the leftover breakfast cereal is carefully moulded into a bowl or

square pan that is first wet with cold water, it may be sliced and fried as an acceptable luncheon dish.

Wash white silk gloves at night in warm suds, rinse well and dry. Drying them in daylight causes them to turn yellow.

Ground rice is excellent for cleaning white cloth. It should be applied with a piece of clean white flannel, left for two or three hours, and then well brushed and shaken.

The taste of made-over dishes may be improved by a few drops of onion juice, but not enough to give it a strong flavor.

As the warm weather approaches, less meat should be eaten, and eggs or some other light food substituted.

WATERMELON RIND AND CITRON PRESERVES.

Remove the green outer rind of the melon, and cut the remainder into strips or pieces of small size. Cover with cold water, adding 1 tablespoonful salt for each quart water, and let stand over night. In the morning drain and rinse thoroughly; then cook in clear water until transparent. Drain again. Make a syrup of three-quarters pound sugar and one-half cupful water for each pound of rind. Skim, add one sliced lemon, a bit of ginger root and the rind. Cook about twenty minutes, or until the melon looks clear; then skim from the syrup into jars. Boil the syrup until thick and pour over fruit in jars.

WASHING FLUID.

For a good washing fluid take one pound of borax, one pound of potash lye, one pound of washing soda and one pint of ammonia. Mix the first three ingredients in an enameled pan (not tin) with five quarts of boiling water. When cold, add the ammonia and pour into an earthen jug. About half a cupful of this fluid is enough in the water of an entire wash.

CLEANING LIGHT CLOTH.

Light cloth coats can be cleaned at home with oatmeal and whiting. Lay the garment flat on a clean table, mix the oatmeal and whiting in equal proportions and with a piece of clean flannel rub thoroughly and evenly into the cloth. Shake well, and if necessary go over again and repeat until the cloth looks perfectly clean. Then shake well and press on the wrong side with a warm iron.

THE REAL VERSION.

Napoleon sat inadvertently upon a smoking cannon and scorched the seat of his white trousers.

"I cannot turn back now," he muttered to an aide as he hastily dismounted. "I have burned my breeches behind me!"

This historic expression has been grossly corrupted by later writers.—Pathfinder.

"I called a prize fighter a liar today."

"Gee whiz! What did he do?"

"I don't know; I hung up the receiver."—Toledo Blade.

How wonderful the power of love,
For the world all loves a lover,
But greater is the power of shove,
For the world all shoves a shover.
—Puck.

"You find yourself refreshed by the presence of cheerful people. Why not make earnest effort to confer that pleasure upon others."

What does your anxiety do? It does not empty tomorrow, brother, of its sorrow; but oh! it empties today of its strength.—Ian Maclaren.

THE BEST OFFER WE HAVE EVER MADE

We have furnished in the last few weeks over 1200 of these

LATEST CENSUS CHARTS

FREE

To the Man Who Owns a Horse, a Cow, a Sheep, or Hog;

To the Woman who Owns Poultry:

Willsden's Anatomical Chart will be found more valuable than any single book or publication that can be secured anywhere, at any price.

It includes five distinct plates in colors of the horse, first showing exterior parts; second, the bones; third, the veins or circulatory system; fourth, the muscles, and fifth, the internal organs. Each part, bone, vein, muscle and organ is plainly designated by name.

There are also five similar plates each for the COW, SHEEP, HOG, and CHICKEN, all carefully drawn and engraved, and in correct coloring. In connection with these plates are carefully written articles by eminent stockmen and veterinarians, describing the chart in detail. For instance, the write-up on cattle gives an explanation of each of the five plates, then gives some valuable suggestions regarding general care and management, shelter, and feed, as well as describing their common ailments with symptoms and treatment. While this chart may not displace the veterinary surgeon, a thorough understanding of the information it contains will save thousands of dollars' worth of livestock and poultry each year which have been lost heretofore BECAUSE THE OWNER DID NOT KNOW AND HAD NO WAY OF FINDING OUT JUST WHAT TO DO AT THE RIGHT TIME.

The HON. F. D. COBURN, who is considered authority, in his book "Swine in America," gives several secret remedies. The LIVESTOCK ANATOMICAL CHART GIVES THESE SAME REMEDIES, AND THAT ON HOG CHOLERA CURE IS ALONE WORTH HUNDREDS OF DOLLARS TO ANYONE WHO RAISES HOGS.

The publisher of the SHEPHERD JOURNAL gives in this chart many valuable treatments of diseases of the sheep.

DR. J. W. THOMPSON, editor of THE SPIRIT OF THE WEST, gives a world of information on care and treatment of diseases of the horse.

REESE V. HICKS, editor of POULTRY CULTURE, takes up the subject of poultry, and also gives the best known method of preserving eggs; it is simple—yet has been recommended by the Governments of the United States, Great Britain and Germany.

This Chart Also Contains

Latest map of California and Nevada.
Map of the United States.
Map of the World.
Complete list of California cities and towns with 1910 census.
Portraits of all California governors, from first to last.
Pictures, maps and data concerning Panama Canal.
Flags of all nations.
Portraits of the world's rulers, etc.

Read what a few of the Best-Informed Stock and Agricultural Authorities of the Country have to say:

Frederick W. Meyst, Washington, D. C., says:
During all my studies and experience I have never come across a chart so complete in every detail as the Willsden' Livestock Anatomical Chart. Every farmer and live-stock raiser should have one.

C. H. Stange, Iowa State College, Ames, Ia., says:
In my estimation the Livestock Anatomical Chart should be used in office or home of every livestock raiser.

John M. True, Secretary Board of Agriculture, Madison, Wis., says:
The Livestock Anatomical Chart contains much useful information for the stockman and farmer, and is arranged in a manner both available and practical.

Dr. O. O. Wolf, President Kansas Med. Vet. Assn., says:
Through the Livestock Anatomical Chart the practical knowledge in the care and treatment of livestock may be had through which thousands of dollars may be saved by livestock raisers and farmers everywhere.

How to Secure This Unrivaled Chart Free

The regular price of the RURAL CALIFORNIAN has always been and is now $1.00 per year. For a short time, as a special circulation-increasing offer, old or new subscribers sending us $1.25 for TWO YEARS subscription in advance will be sent one of these valuable charts without cost. To insure getting one of the charts this offer should be taken advantage of quickly. Why not write today?

San Francisco-Los Angeles Produce Markets

Los Angeles Market

LOS ANGELES, Nov. 1, 1911.

Butter.

Receipts of butter are very light, and the market is firm. An advance of a cent and a half is noted.

Prices to trade 2½c in advance of the following Produce Exchange quotations:

Extras	34½
Firsts	30
Ladles	25
Country	23

Cheese.

Local Anchor	16
Oregon Daisy	17@17½
Northern Fresh	16@17
Domestic Swiss	18
Imported Swiss	33

Eggs and Poultry.

Only 50 to 60 cases of eggs are received daily, and every offering is cleaned up at once. Prices are steady at last week's quotations. Large consignments of Eastern poultry are received, but local stock is so scarce that the demand for Eastern stock has increased considerably, causing the market to remain firm.

Buying prices f. o. b. Los Angeles are:

Local Ranch Candled	49
Case Count	45
Eastern	32@34
Eastern storage	25@26
Pullets	26

Dealers pay for live poultry f. o. b.:

Hay.

We quote the wholesale prices in round lots on today's market as follows, viz.:

Receipts of hay for the past six days have been 2,650 tons. This is about the same amount that our market has received each week for the last two weeks. The arrivals have consisted principally of alfalfa and the poorer varieties coming by water, as there has been very little shipped in by railroad from the warehouses in good hay districts.

The general condition of the market is just about the same as for the last few weeks, as there has been no change practically one way or the other. Demand has not improved, as most consumers are using hay purchased from fields. It is expected, though, that we will see a brisker market very shortly. Prices have remained steady and unchanged, and the feeling throughout is shown to be quite firm for the future.

The most interesting feature of the week has been the sale to Southern California people of several large lots of hay for shipment to Southern California. This hay was intended for our local markets, and the fact that it has

been bought to ship out of our territory adds another element of strength to the situation and disposes of certain quantities of warehouse holdings. Recently there has been some shipped out of this port for export trade.

The San Francisco Hay Association is about to compile records of hay in warehouses tributary to the San Francisco market.

The alfalfa market has continued along this week without any changes of interest.

We quote the wholesale prices in round lots on today's market as follows, viz.:

Fancy Wheat Hay	19.00@20.00
No. 1 Wheat or Wh & Oat	16.00@17.50

Deciduous Fruit Market

F. B. McKevitt, general manager of the California Fruit Distributors, reports:

The following gives the number of cars of deciduous fruit shipped from all points in California for the week (7 days) ending Friday morning, October 27th.

Pears—7¾ cars; movement of this fruit is nearly concluded, but there will be a few cars yet to go. So few, however, that they will cut little or no figure in the season's total.

Grapes—562¾ cars; Tokays are now nearing their finish. Should it not rain there will be considerable shipments of them to go forward during the next week, after which time there will be very few left. Cornichons are making their appearance in increasing quantities, and the shipment of Emperors is well under way. These two varieties will constitute the bulk of the movement during the remainder of the season, which will probably last for another 30 days, if weather permits.

Although the weather has been somewhat threatening since our last letter no general rains have fallen, and prospects are the good weather will continue for some time.

Comparative Statement of Shipments. October 21st, 1911.

	1910	1911
Cherries	250½	216¼
Apricots	289¾	214½
Peaches	2517¾	2027
Plums	1552½	1366
Pears	2356	2294¾
Grapes	4210½	4782½
Sundry	16	14¼
Total	11,193	10,915¼

Citrus Fruit Market

LOS ANGELES, Nov. 1, 1911.

The citrus year closed last night. All Valencias were not shipped out, though there probably remain not over a dozen cars, and they are all in Orange County. Prices remain very satisfactory, though the market is not as firm as a few weeks earlier. The number of Porto Ricans, Jamaicas and Floridas (10,000 boxes of these were disposed of in New York Saturday) which have come in have filled the market with the cheaper grades of fruit, so that only the very best of Valencias have commanded top prices. On the whole the year has been the most successful of the citrus industry. The immense quantity of nearly 40,000 carloads of fruit has been handled so that there has been practically no loss, and much of the time the best of prices have been obtained.

Lemons have eased off somewhat and are now being placed in the New York and other Atlantic Coast markets at prices lower than imported lemons could have been secured for had Californias been out of the market. It is probable that prices will shade slightly from now on until Christmas time. By that time regular winter prices may be considered established, and they will probably remain stationary until the warmer weather of spring.

Shipments.

We go to press one day too early to give the complete shipments for the year. That one day will probably aggregate not far from a dozen or fifteen cars, all from Southern California points. Complete returns from Tulare County show 2,193 cars of oranges, 105 cars of lemons; Butte County, 489 cars of oranges; Southern California, up to October 30, 36,816 cars of oranges, 6,751 cars of lemons, a total of all citrus fruits for the year from Southern California of 43,576 cars, or a grand total for all citrus fruits from the state, with one day yet to hear from, of 46,363 cars.

NEW YORK, Oct. 31.—Seven cars Valencias, one car lemons sold. Oranges firm, lemons unchanged. Weather partly cloudy.

HOW FARMERS BECOME PROSPEROUS.

Our American farming population is prosperous.

If you doubt this statement, take a run throughout one of our great Agricultural States, and note the fine farmsteads, well kept lawns, freshly painted buildings, chugging automobiles and general air of —"what-do-we-care-we've-got-the-dough-right-in-our-pockets"—that seems to prevail everywhere, and you will be obliged to admit that at least the symptoms of prosperity are pretty generally present.

The fact is, that farmers are prosperous—especially cattle feeding farmers.

Dr. Hess Stock Tonic has worked a revolution in that line of farm industry. It has eliminated the element of chance, and placed the feeding business on a solid basis that insure success.

This statement may seem an exaggeration, or beyond reason to the reader, unacquainted with the article in question. Nonetheless, it is true, and backed by the experience of thousands, who, by its use, have changed a disheartening struggle for livelihood into a joyous jaunt down "easy street."

Do you want to know what Dr. Hess Stock Tonic is and how it helps a cattle feeder?

First, then, we'll say what Dr. Hess Stock Tonic is not. It is not a ration, like cornmeal or bran; neither is it fed as a ration, or intended to take the place of a ration.

Everyone experienced with cattle knows that at times they show very little appetite. This is usually the after effect of a continued term of heavy feeding, and is, of course, a setback to the feeder, because it extends the cash outlay for grain. Besides, it may mean the loss of the very best market. Now Dr. Hess Stock Tonic **prevents this loss of appetite**, and consequent pecuniary loss, by keeping the animal's digestive organs in a vigorous and active condition, regardless of the amount of feed consumed. As a doctor of medicine would say, it gives "tone" to the digestive organs—makes them stronger and better able to bear the continued strain which the feeder is putting on them.

Certainly Dr. Hess Stock Tonic is a great help in making beef or milk. Probably, if the question were asked, nine out of ten successful feeders or dairymen would attribute their plethoric bank accounts to the use of Dr. Hess Stock Tonic. Dealers are reporting a great demand for this tonic, the more so, as it is well known to be a guaranteed preparation.

HOW GEORGE SOLD THE FARM.

"We were all sitting around the stove down in Bill Luken's general store the other night," said Sam Miller, "and we were talking about how much work we were going to do when it had stopped raining. It had been raining off and on every day for a week, and it did come down like pitch-forks most of the time.

"All at once we noticed that George Hicks was standing by the counter with a most solemn look on his face. None of us had heard him come in, and we were all surprised to see him and not hear him, because he always lets you know he is a-coming. He hadn't been around for a week, either.

"Fred Pettingill, who was telling about his new carriage, stopped talking and exclaimed, 'Hello, George! What makes you look so solemn? Somebody sick?'

"George sat down. 'Boys!' he began slowly, 'you know my son Jim went to town when he was young, and now he is treasurer of a big company up there. He wants me to sell the farm and come live near him. He bought a nice little place for me, out in the suburbs, and says I can raise enough on it to supply us with food, and have things pretty easy.

" 'Mother and I was both pretty well took with the idea, and decided to sell the old place. I advertised in the city papers, just about the time it started to rain, and in the last two weeks over twenty people have been to see the farm.

" 'The roofs on our place are all shingle and tin, and they most all leak. I was going to put new ones on this spring, if we hadn't decided to move.

" 'Well, every time anybody came the roofs were leaking to beat the band, and nobody would touch the place. Jim is waiting every day for us to come, and mother is worrying because we can't sell the place. I just wrote to Jim today to find out what to do about the roofs.'

"John Sikes, a young city fellow, who had bought old Si Mather's place, when nobody would live in it because it was so damp and musty, on account of the leaky roof, was sitting in the corner. He had fixed that old place up, and was making all kinds of money raising pigeons, and the old house was dry as a bone.

" 'Mr. Hicks,' says Sikes, 'you use Genasco Roofing, made by the Barber Asphalt Paving Company, of Philadelphia, like I did, and you will put a roof on your place at small cost, and I'll bet you five dollars you will get a couple of hundred dollars more for your place.'

"Before George could say anything the telegraph operator handed him a telegram from his son. George opened it and it just said: 'Use Genasco Roofing. Will expect you next week.'

"And George got the roofing, laid it himself, sold his place for five hundred dollars more than he paid for it, and moved away inside of a week."

REMARKABLE DEMONSTRATION.

The utility of a traction engine on the modern farm and the great saving which it effects to the farmer has recently been demonstrated in a large number of cases. The showing made in power transmission and low cost of operation marks a new era in the use of machinery on farms where a number of horses are usually employed.

One of the most remarkable recent demonstrations was that near Stratford, in Kings County, on the farm of Anthony Ambrosini, when a Fairbanks Morse 12-25 H. P. Oil Tractor was used to pull an Eight-gang 24-inch Disk Plow, plowing six to eight inches deep and seven feet wide. The soil had been cultivated before but was pretty firm with quantities of Bermuda grass roots. It made a perfect score, plowing a seven-foot step, nine miles long, or three times around a half section, i. e., one mile long and one-half mile wide.

The Fairbanks-Morse 12-25 H. P. Oil Traction Engine which was used in this demonstration, as well as in several demonstrations of a similar nature made around Ventura and Oxnard, is the latest adaptation of the internal explosion engine for use with the cheapest marketed liquid fuel. It is one of the simplest, most durable and easily handled tractors on the market and will do the work of twelve horses. Can be used for belted service where 25 H. P. is required, and is admirably suited to threshing and hay baling.

It is claimed by Fairbanks Morse & Company that the new 30-60 H. P. Traction Engine which will be seen here shortly will be a great surprise for low cost of operation, excellent belted service and tractive power.

OF VALUE TO HORSEMEN.

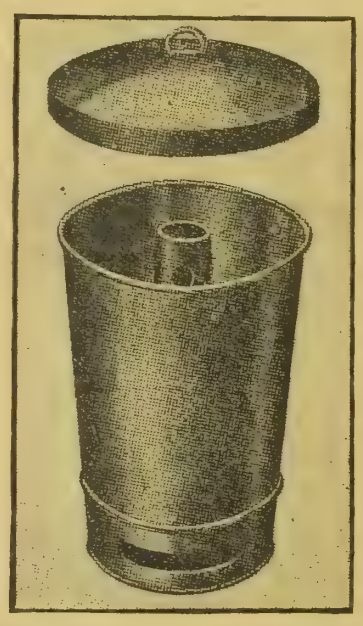
Do you turn your horses out for the winter? If so, we want to call your attention to a very important matter. Horses which have been used steadily at work, either on the farm or road, have quite likely had some strains whereby lameness or enlargements have been caused. Or perhaps new life is needed to be infused into their legs. Gombault's Caustic Balsam applied as per directions, just as you are turning the horse out, will be of great benefit; and this is the time when it can be used very successfully. One great advantage in using this remedy is that after it is applied it needs no care or attention, but does its work well and at a time when the horse is having a rest. Of course it can be used with equal success while horses are in the stable, but many people in turning their horses out would use Caustic Balsam if they were reminded of it, and this article is given as a reminder.

FOR THE ASKING.

The 1911 Autumn catalogue of the Charles H. Lilly Co. of Portland, Ore., is before us, and while it makes no great pretension as to typographical beauty, is full of much valuable information as to small fruits, seeds, ornamentals and other factors of interest to the planter. It is yet somewhat early to consider the season's planting, but the one who begins now by posting himself as to what the different seed and plant houses have to offer, is the better prepared for planting when the season is really here. A post card will secure this catalogue if The Cultivator is mentioned.

The Troutman Orchard Heaters

These are some types of the famous Troutman Orchard Heater, but the No. 1 is the size we recommend for the reason that many small fires are much more effective than half the number of larger ones. Orchard heating is far beyond the experimental stage. Mr. G. B. Brackett, Pomologist of the Bureau of Plant Industry of the U. S. Department of Agriculture, in the Year Book of 1909, following an illustration of the Troutman Heater and the ONLY one he so recognized, says: "One of these well-known and extensively used orchard oil heaters, constructed on scientific principles, has a center draft tube that feeds air to the flames, promotes combustion, and makes good use of the oil. This heater has successfully stood the test of several years. It is successful because based on the principle that there is no need for great heat locally, but for numerous small fires well distributed." In the same pamphlet Mr. Brackett also illustrates an orchard equipped with our heaters. After such a recognition of actual achievement, why should anybody hesitate to buy the Troutman? But the "knocker" is abroad and we expect him, for the reason that when the boys go into an orchard we notice they always club the best tree.



Mr. C. C. Chapman bought our heaters last year, and in doing so said: "We may not have to light them this year, nor the next, for we don't need protection as much as some other sections do, but we'll get it **(a freeze)** some time, and I'm going to be prepared for it." That's hard-headed business. Another grower to whom we sold and who had a five thousand dollar crop frozen the year before, borrowed every dollar with which to build his underground cistern for oil, his heaters and tank wagon. That's more good business, backed by fine nerve. Another grower said, with sulphurous heat, that his neighbor wouldn't buy heaters and he would be smashed if he was going to heat his own and allow some of it to drift over the line into the other fellow's grove. That's some selfishness, but more mule. What are you going to do? Send for our Year Book and testimonials, but better still, send your order at once to

W. H. FOWLER

MAN MUST EAT

There is money in

SUGAR and CATTLE

Share in the profits of an agricultural investment, comprising over 21 square miles of rich agricultural lands.

The land has an abundance of water in a district where irrigation, drought and frosts are unknown. Large tame grass pastures have just been prepared.

The land is free from incumbrances, which affords our investors the highest degree of security.

THE PRODUCTS OF THE RANCH ARE CATTLE AND CANE SUGAR, TWO OF THE WORLD'S BIGGEST DIVIDEND PAYERS, AND ON WHICH THE MARKET IS STEADILY ADVANCING.

In this district lean cattle fatten in four months in tame grass pastures and increase 50% to 100% in value.

Cane sugar is manufactured at one-third the cost of beet sugar.

Additional capital is required for improvements and to buy cattle to stock the ranch. A limited amount of investment certificates will be issued in units of $100 cash or on installments. Six per cent per annum interest is guaranteed, and we also share the profits with you. Option given to withdraw your money and profits or to become a part owner of this great property.

Applications for certificates will be filed in the order received. This enterprise is backed by some of the most substantial and well-known business men of Los Angeles. We invite the strictest investigation.

Send for free booklets and descriptive literature.

Vol. XXXVII. No. 19. LOS ANGELES: THURSDAY, NOVEMBER 9, 1911 One Dollar the Year

Splits of the Navel Orange---Cause and Remedy

Dr. J. Eliot Coit, of the Southern California Pathological Laboratory, Writes for Cultivator Readers of His Observations. Deep Irrigation and Thorough Culture, with Good Weather Conditions, Make for Perfect Fruit

The time of year is again drawing near when oranges will color up and owners of orchards will feast their eyes on the beautiful sight while indulging in mental estimates of the number of boxes per tree. To have the satisfaction of beholding one's orange trees loaded with fine fruit spoiled by the presence of a large number of fruits cracked and split open is indeed vexatious. Many have been the inquiries in regard to the cause of splits, and many the theories advanced. To date, however, nothing of value in the way of a cure or means of prevention has been brought forward. The only excuse for offering my observations and conclusions at this time is the insistent demand for information.

Losses From Splits Heavy.

Counts made in eleven packing houses in Southern California showed that on the average eighteen per cent of the culls was due to splits. This represents only a part of the loss, as most of the badly split oranges either drop from the trees or are discarded by the pickers and never reach the packing house.

It is difficult to estimate, with any degree of accuracy, these losses in dollars or cents, but in my judgment $50,000 a year on the average would be conservative. While it is the intention of most packers to exclude all splits from long distance shipments, these are not all a dead loss, for local peddlers pick over the culls and pay from fifteen to twenty-five cents per loose box for the slightly split but otherwise sound oranges. These are consumed locally, Los Angeles being a very good market for splits.

Mostly in Navels.

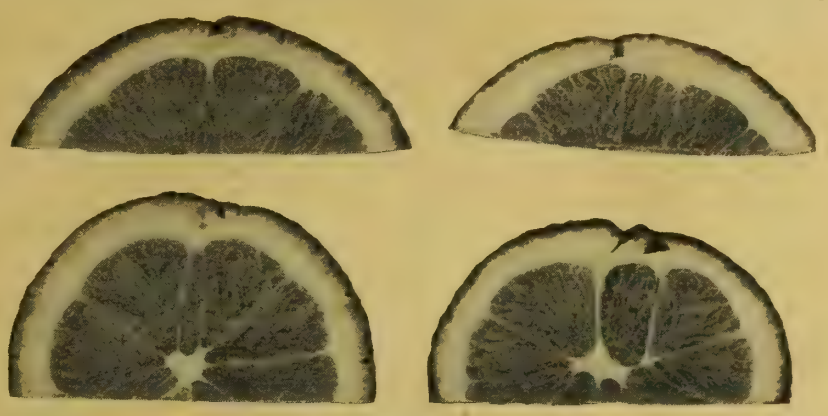
Splits are almost wholly confined to Navel oranges, and the percentage of loss runs much higher in the hot interior valleys than near the coast. Furthermore, the amount of splits varies markedly from year to year according to the weather conditions. The losses in the 1911 crop were unusually heavy, while from present prospects the outlook for the coming crop is more encouraging.

The most common theory in regard to the cause of splits is that an irregular water supply, causing wide variations in the moisture content of the soil, produces a greater fluctuation in the growth of the interior than in the skin of the orange. Such a theory is quite reasonable, but I am convinced that such moisture fluctuations are a contributory cause only. In support of this I have only to point to the fact that even in the orchards suffering most from splits there is always a large proportion of sound oranges. If we charge splits to irregular moisture conditions in the soil which affect the whole tree, why do not all or nearly all of the oranges split? Surely some other important factor must enter into this problem.

Two Kinds of Splits.

Observation in the orchard reveals the fact that there are two kinds of splits, viz., side splits and navel splits.

Side splits occur from the time the oranges are half grown until they are colored. They originate on the side of the orange, and in many cases the fruit is split wide open, the two halves often standing at right angles to each other. By cutting cross sections of oranges in the earliest stages of side split, in nearly every case a small cavity will be found in the spongy tissue of the skin. Evidences of this long, narrow cavity appear on the surface as one or more slight grooves running part way from stem to navel. The epidermis over these cavities is usually so very thin that it cannot stand the strain of interior growth which takes place when a sudden supply of soil water occurs contemporaneously with a high relative humidity of the air. Most of these side splits either fall to the ground or are discarded by the pickers, and consequently very few are seen in the cull heap at the packing house.



Cross Sections of Incipient Side Splits, Showing Cavities in Skin.

Upper Row Side Splits; Lower Row Navel Splits. —Photos by Coit.

Navel splits originate at the navel, the opening in the skin working back toward the stem. There may be one or several separate ruptures. While a certain proportion of the affected fruits may open so wide as to be worthless, still a very large number develop the split to a slight degree only. While such fruits are as good as any for consumption, it is very unwise to attempt to ship them long distances. No matter how small the split may be, the brushes are almost sure to inoculate them with mold spores, and as a consequence the fruit decays in transit. Although the loss appears large, it is good policy to grade all splits out of the pack and dispose of them locally.

If a number of navel split oranges are cut in longitudinal section it will be found, almost without exception, that the thickness of the rind varies, being quite thick and often creased at the stem end, and as thin as paper near the navel. Specimens with uniform thickness of skin very rarely split.

Relation of Weather to Splits.

The loss of moisture from the foliage and fruit of the orange tree is influenced by four factors, viz., the velocity, temperature and relative humidity of the air, and the intensity of the sunlight.

At irregular intervals during late summer and fall the principal orange districts of California usually experience periods of several days when a dry, hot east wind blows from off the desert. When the wind changes the sudden inflow of moisture laden air from the sea produces a very marked change in the weather conditions. During such dry "Santa Anas" we find all four transpiration factors at their maximum. At such times the air movement is rapid, the relative humidity lowest, the temperature highest, and the rays of the sun most effective. Considering these conditions, it is not surprising that the pull or demand of the air on the plant for water should be tremendous. The writer has maintained at Whittier, Riverside and El Centro, during the past summer, porous cup atmometers which measure this evaporating power of the air. During the fairly mild east wind of October 6, 7 and 8 the evaporation figure at Whittier averaged 48, while for the three succeeding days, October 9, 10 and 11, the figure dropped to 30. Whenever one of these dry spells occurs just before irrigation the growth of the skin is checked, and whenever the return of moist weather coincides with the application of irrigation water the sudden resumption of growth on the interior of the orange proves too much for the paper thin skin about the navel, and splits follow as a natural consequence.

How Splits May Be Prevented.

No man can control the weather, and hot, dry spells are liable to come just when they are least desired, but for all that it is my belief that the control of splits is not a hopeless proposition. As far as the old established orchards are concerned, about all we can hope to do is to reduce the variation in soil moisture to a minimum by skillful irrigation. Such a practice is also highly desirable on account of the benefits derved from a reduction in the amount of mottled leaf, gum disease and scaly bark.

The fundamental remedy for both navel and side splits, however, lies deeper. We have seen that sudden variations in the weather act as a contributory cause only, the primary cause being imperfections in the skin and variations in the thickness of the skin. **By careful selection of bud wood we may very largely eliminate such undesirable types.** If it is possible by careful selection of thornless bud wood to produce thornless trees, it is possible by the same method to produce trees bearing navel oranges free from creases in the skin and variations in the thickness of the skin—Navel oranges running to the ideal shape and size in high percentage and which will not split despite the most unfavorable weather conditions.

Largest Citrus Nurseries in the World

If you contemplate planting of Citrus groves this season you should get our prices.

Every Tree True to Name

Our trees are all budded from 3 to 7 inches above the surface of the ground, which will eliminate any possibility of planting the bud union below the surface of the ground.

This particular point should receive due consideration.

We can fill orders in any quantity of all the Standard varieties.

Our booklet, entitled "Citrus Fruits" mailed to any address on receipt of 25 cents; credit given for this amount on first order.

TARIFF CAMPAIGN.

The lemon people are making a strong fight for the retention of the cent and a half tariff which now obtains on lemons. If the strongest effort will win the lemon tariff will be retained. The tariff question has ceased to be as much of a partisan issue as it was. In Republican ranks are many who would see a revision downward and in Democratic ranks many who would see protection of worthy and struggling industries, so that the following quotation from a circular sent out from Washington is not an exhibition of partisanship on the part of the Cultivator—merely a showing of one of the efforts to protect California fruits from the Southern European competition. This is not given to encourage greater effort on the part of the lemon men so much as to encourage other fruit growers to be looking out for their own welfare in this tariff revision fight. The lemon men have made a strong fight and they have been brought to the attention of the public more than almost any other fruit growers of the state, but there are other industries which need the protection as much as lemon raising. Let our walnut, raisin, prune, and other producers get busy with some of the energy the lemon growers are showing. From the circular mentioned we quote:

* * *

The Circular

Some phases of the tariff revision war are peculiar, and almost humorous. When the Payne-Aldrich bill was under discussion, the most insistent demands for reduction of duties were voiced by the importing interests, which naturally have no sympathy at any time with American industries or American labor. In the present fight, certain importers have sought and obtained the co-operation of foreign producers, who are submitting to a tax for the creation of a fund with which to fight protection in its lair, and to influence legislation right here in Washington.

It is a fact well known, now, that speculators in Palermo, Sicily, and in New York City, have joined hands to secure a reduction in the lemon tariff which in 1910 paid into the U. S. treasury the very respectable sum of $2,233,527.87 as compared with collections of $1,351,758.88 for 1909, the year before the new tariff went into effect. As a tariff producing a substantial revenue, this appeals to conservative Democrats, while as a measure giving reasonable protection to a growing home industry, it is favored by Republicans and protection Democrats alike. The consumer does not suffer by it. On the contrary, he is benefited by competition which would not exist if the tariff were wiped out or reduced to a figure which would not allow the American lemon growers to exist, or which would keep them out of the New York market. With no tariff, or an inadequate one, the American growers would hardly be able to sell the fruit east of the Alleghanies. This would give the Sicilian fruit an absolute monopoly of that section of the United States, by reason of the lower price at which it can be produced, and the cheap ocean freight rate to New York. As the business is in a very few hands, combined under a close working agreement, and as it enjoys further the protection of the Italian government to an extent which practically offsets the benefits derived in this country from the tariff, the New York price could and would be kept at a figure limited only by the rapacity of the importers and the ability of the public to pay. Any attempt by the American growers to invade the eastern markets could be met, as in the past, by a temporary reduction in prices which would drive them back into their limited western territory with severe losses, after which the prices would again advance for the benefit of the importers.

Hiring Lobbyists.

Here is a stake worth playing for. It is for this that the Sicilian growers are giving up an assessment which has ranged from four cents to ten cents on every box of lemons shipped to the New York market. It is for this that they are vociferously demanding the reduction or abolishing of the lemon tariff. It is for this that they are hiring lawyers and lobbyists, to try to influence legislation. It is because of this meddling with American legislation that the names of certain Congressmen, who are held to be friends of the Sicilian lemon growers, are spoken freely in the home of the Camorra and the Black Hand, and that they are referred to as friends of the alien rather than as representatives of American industry.

With a well-financed campaign like this, aimed at an American industry, it becomes necessary for the lemon growers to defend their commercial existence. Through their mutual organization, they employed the foremost expert in their line in the world, G. Harold Powell, whose investigations for the department of agriculture in California, Spain and Sicily demonstrated his high standing as a practical scientist. It was decided to procure detailed figures showing the cost of producing lemons in California and also to procure full data regarding the industry in Sicily, Italy and Spain, although the latter country does not figure largely in the production of lemons for export. Mr. Powell has just returned from his tour of investigation, and while he has not collated his data he is in a position to substantiate all that he has said previously regarding the cost and conditions of production abroad.

Securing Facts.

Mr. Powell sailed April 18th for Europe, accompanied by Frank F. Chase, vice president of the National Orange Company of Riverside, and one of the best authorities in the world on the orange and lemon. His intimate practical as well as theoretical knowledge of irrigation engineering, and every phase of the industry, constituted him an expert and supplemented the practical and scientific knowledge of Mr. Powell, so that the investigations made by them had all the value of a dual inquiry. They studied the industry in all of the important lemon producing sections of Sicily and Italy, took numerous photographs, and found that they were able to determine the variations in the difference of cost of production, cultivation, irrigation, fertilization, yield of trees, number of trees per acre, value of

properties, cost of equipment, and all of the factors entering into the problem. They also determined the cost of transporting the fruit, and the variations in the cost of getting it from the groves to the steamships. Mr. Powell's investigation, made two years ago for the government, had made him thoroughly familiar with all the details of the business, and the growers and shippers, appreciating this fact, extended him every courtesy and opportunity to study the industry from all standpoints.

The most striking thing found by investigators was that no two groves or shippers gave the same figures as the basis of cost. This is doubtless due to the fact that the groves vary in size from a few trees to groves containing hundreds or thousands of trees. The cost often represents little more than the value of the labor of the family that cares for the grove. The greatest variation was found in such items as the cost of gathering the crop. Sometimes this would vary 100 per cent in different localities.

Protection by Bounty.

An important factor in the situation is the protection extended to the industry by the Italian government through the citrate of lime monopoly. Twenty per cent of the entire crop is converted into citrate of lime, and the government guarantees a minimum price, thereby materially affecting the price of the fruit exported to the United States. It acts practically as a bounty on the price of the fresh fruit, and in that way the Italian government does practically the same thing this government does through a customs tariff.

Mr. Powell secured a large amount of data from Rome and from the various experts in Italy on lemon and orange culture. He found that the lemon industry is now in a very flourishing condition there. Lemons constitute the most profitable crop in Italy and Sicily, and the growers are prosperous. The price of lemons to the grower is higher now than it has been for years on account of the great growth in the demand for lemons all over Europe. Lemon exporters at Palermo told the Americans that the European market is expanding rapidly and that new markets are opening up every day. With the increased demand, the damage to the crop by frosts and wind storms has resulted in an abnormal increase in the price. There is a tendency in New York, Mr. Powell found, to attribute the higher prices to the Payne-Aldrich tariff, but the tariff on lemons has had no adverse effect on the business in Sicily, where the exports are heavier than ever before. For the year following the enactment of the Payne-Aldrich bill, imports of lemons into the United States were 25,000,000 lbs. in excess of the importations for the previous year, and it is probable that the imports for this year will equal those for last, as lemons are coming over in unprecedented quantities.

European Money.

As has already been stated above, Mr. Powell found in Palermo a very vigorous organization which is collecting funds and sending them to the United States to be handled through the American-Italian importers. The existence of this fund is no secret in Italy, but its purpose is known and understood by every one. Prior to May 1st this money was collected by the American importing interests. A change was made in the place of collection on account of the difficulty of making the collection in New York. Mr. Powell learned in Palermo that the collection of the fund is provided for in the steamship rate. The rate was raised to cover the amount of assessment for the fund, and the amount of the assessment for the fund, and the amount of the increase is rebated, and paid into the anti-tariff campaign fund, with which the foreign interests are seeking to influence public sentiment, and to affect legislation in Congress.

Different Conditions.

That there is a big difference between the cost of labor in this country and in Europe was fully proven by Mr. Powell's inquiries. He learned that labor is about one-third to one-fourth as dear in Italy and Sicily as it is in California, while the cost of handling the fruit is only one-half to two-thirds as expensive, and the cost of transportation is about one-third as great as it is in this country.

Another proof of the fact that foreign interests are back of the fight on the lemon tariff is the activity of Congressman Francis Burton Harrison in the fight for the importers. He comes from the "push cart" district, and the Italian pushcart men are completely dominated by the importing interests. Moreover, Harrison has said that 300 politicians in New York have petitioned him to have the duty lowered. The importers are very active, and are circularizing the trade through their New York office, but the nature of the campaign is well understood in Washington.

MELANOSE.

Melanose is a disease that starts only on the young leaves, stems and fruit. The individual marks or spots, caused by the disease, start as sunken points, which grow larger and more evident as the tissue grows older. They may reach a diameter as great as one-sixteenth of an inch. Frequently these marks are so plentiful that as they grow they run together, forming a mass or area in which the individuality of the marks will be lost. The individual markings, and sometimes the areas, become arranged in circles or parts of a circle. This is characteristic of melanose. In many cases, particularly if the fruit hangs so that water drips on to it from a leaf or branch above, the location of the areas will resemble withertip tear staining.

The markings of melanose in its mature condition are waxlike and reddish brown in color. They somewhat resemble a drop of melted sugar burned to a reddish brown color. They are slightly raised above the surrounding surface. Upon the stems and fruits the markings more frequently run together, forming areas. Where the disease is severe the stems will be more or less completely covered with the markings. Young terminal twigs, when severely affected, will die and dry up, appearing very much the same as the stained terminal branches in dieback. The fruit, when severely affected at an early age, will be stunted. In most cases it will grow to a normal size, but will have the markings more or less completely scattered over its surface. The markings are not attached bodies like a scale, but are a part of the tissue of the fruit itself. Therefore they cannot be removed, and the fruit is worthless for shipment. The development of areas is greatest on the fruit. Very often they are large, cakelike, and cracked in lines like dried mud.—Florida Fruit News.

Deciduous Fruit Culture

MORNING GLORY.

Report of Prof. C. W. Beers, Hort. Com. of Santa Barbara County.

Three months for successfully combatting this pest have been worked out on our soils and have proven reliable in different sections of the county, absolute results having been obtained in every type of soil treated.

Salt Brine.

Prepare the portion of ground upon which the morning glory is growing by plowing to the depth of ten or twelve inches and thoroughly pulverizing the soil and working it into a perfect tilth. Make this patch from two to three feet beyond the edge of the growing pest, as the roots of the weed will extend considerably beyond the outer portion of the growing top. Unless this precaution is taken the weed will be found growing up, outside of the treated portion of land.

Having prepared the soil thoroughly, saturate the entire patch with a salt brine made by dissolving two pounds of salt in each gallon of water, thoroughly stirring the brine until the salt is well dissolved, wetting the soil to the depth of eight inches, carefully examining the soil by digging down into it, to be sure the wetting goes fully eight inches in depth.

After saturation cover the patch with straw to the depth of one foot, and then wet the entire mass with water. This water keeps the right conditions of moisture for efficient results, while the straw mulch prevents evaporation and maintains a uniform condition and promotes the action of the salt on the living tissues of the plant.

By keeping the pest from coming to the light and air sour sap sets in and the entire plant is destroyed. Dry salt is not effective; to get positive results moisture must be kept up so that the salt is always damp.

We find that it requires two years for the soil to recover from the brine treatment and we recommend that additional straw be added when it is observed that the first application has settled down and become rotted. Any straw will do, grain or bean straw, or the chaff from mustard. The idea being to provide a mulch that will hold the moisture and keep out the air.

Distillate.

Follow the direction for working the ground as in the case of the salt brine method, working the soil to the depth of a foot. Wet this prepared soil with water, to the full depth and allow it to stand for twenty-four or forty-eight hours, that the soil may become free from any soggy condition. The object of this wetting being to save on the amount of distillate required to produce results. Be sure the water has moistened the soil to the full depth of a foot. After twenty-four hours or forty-eight hours, depending on the nature of the soil, wet the entire portion treated with distillate, being sure the whole surface is saturated to the full depth and immediately cover with straw to the depth of two feet and wet the entire mass with water. Any litter that will pack as straw packs will do for the mulch. The object of the mulch is to prevent the evaporation of the volatile portions of the distillate. We have proven that it is the volatile element in the distillate that does the killing, and not the asphaltum. Applications of distillate will not eradicate the roots of this pest, unless covered with some good mulch, even where there is a very perceptible residuum of asphaltum remaining in the soil, but if the mulch is provided the results are certain.

Dry Cultivation.

Put the soil into good tilth to the depth of a foot, or at least ten inches. Go over the portion treated with a weed knife that cuts from six inches to eight inches deep every fourth day in moist soil, and every fifth day in soil that is ordinarily dry. The pest must be kept from coming to the surface of the ground as the success depends on preventing air and light from reaching the opening leaves. If this is permitted even for a week, the effort will be futile, as absolute prevention of coming to light is necessary to success. Keeping the plant from light produces sour sapping of the root and destroys all life in the organism. Two years of such work will produce absolute results and in many cases there is no growth the second year. The second year growth will be spindling and lacking in vigor, and confined to small spots.

With the salt brine method two years are required to free the soil from the salt effects. With distillate the following year there are no injurious effects. With dry cultivation the soil does not suffer but is, if anything, the better for the thorough culture.

In fields where large areas are infested with morning glory we have succeeded in checking ninety per cent of the pest by seeding to alfalfa, taking care that the alfalfa secures a thorough stand in all parts of the field. After the first year those places showing any of the pest can be treated locally, by either salt brine or distillate. This method gives some return from the soil during the first year of treatment.

Plowing land infested with morning glory to the depth of a foot, carefully removing the loose earth from the bottom of the furrow and putting in a half inch of salt on the bottom of the furrow and then wetting the salt with distillate, then turning a furrow on to this salt and distillate, and repeating the process in the new furrow opened up, has been found to bring splendid results. The following summer lima beans were planted on the places thus treated and no difference in growth or maturity could be distinguished over the adjoining portion not so treated. The second year a few stray stalks came to light, but they were very slender stalks, and were treated individually.

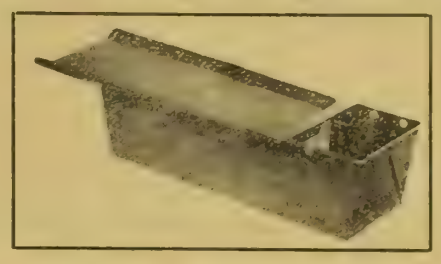
No two sorts of soil will require the same amount of solution, as each piece must be saturated with the preparation used.

In all this processing the portion treated must extend over the portion showing growth, else the outer rootlets will come to the light and produce a new infestation.

Life's a strange thing, and worlds are mixed. The devils and the angels go up and down together; no wonder we want the telling of the sure foundation.—Mrs. A. D. T. Whitney.

Hamilton Orchard Heater

The Only Orchard Heater with Fire Control



Mr. A. Gregory, Manager of the Mutual Orange Distributors of Redlands,

is equipping 150 acres of his orange groves with the King of All Orchard Heaters, having purchased

8,000 Hamilton Reservoirs Six Gallon Size, with a Storage Capacity of **48,000 Gallons with One Filling**

In considering orchard heaters, Mr. Gregory purchased this one for the following reasons:

First—On account of its large storage reservoir, therefore large heat capacity.

Second—Its absolute control, burning oil as weather conditions require.

Third—Because of this fire control a greater volume of heat in cold, early morning hours, can be obtained.

Fourth—Large volume of heat instantly obtained to meet any emergency.

Last—Construction; cover sliding on can not blow off; no seams to leak; won't tip and spill oil.

Frost season is near; get your order in early and have protection; requires 4 weeks to deliver goods. Send for our Red Book.

WHAT EMMER IS.

By B. C. Buffum.

Emmer is a grain which belongs to the wheat family. It differs from wheat in having two kernels of grain in each spikelet and in staying in the hull when threshed more like a barley. It is a feed grain for the fattening of livestock and is good for cattle, horses, sheep or swine. The hulls on the grain help to widen the ration, cause the animals to chew the grain well, separate the particles of food in the stomach, aiding in perfect digestion, mix in some roughage and prevent any trouble from becoming cloyed or "going off feed."

Spring emmer, often wrongly called "spelt," has been successfully grown in the West for a number of years and has proved to be of much value. The winter emmer is a new grain more recently introduced from Russia by the U. S. agricultural department. There is much advantage to the farmer in growing winter grain either for feed or flour. The winter grains give larger yields as a rule than those planted in the spring, and they can be much more cheaply produced. Winter grains succeed with less moisture and are not so much affected by drouth in dry years.

This grain is an important addition to our American farm products. Definite statements can not be made regarding its yields when planted and cared for properly on good soil, but it is safe to say that it will yield more grain and more feeding value per acre than can be secured from any other grain the farmer can grow. It should take the place of corn for stock feeding in the western country where the cool nights or the short seasons interfere with obtaining large yields of corn. It produces well where the summers are so hot that the weather interferes with the growth of spring rains. Being both drouth resistant and a winter grain, it will produce with a small amount of irrigation or rainfall.

APPLES IN STORAGE.

The shrinking of apples which are stored in barrels headed up or tight boxes in cold storage should not be noticeable or excessive, unless the apples are of a variety which are naturally soft and contain much water, or fruit was not suitable for storage. The longer keeping winter varieties should be stored under these conditions in a properly equipped cold storage room without marked shrivelling for any reasonable period up to six or eight months. The protection from drying out afforded by a tight wooden box or barrel seems to be just about the right thing for cold storage. The influence of quantity of goods in the room is, however, quite important. For instance: Take a large room with only a few apples in it, the shrivelling would be much more marked than it would if the room were filled with apples. The humidity would be much higher in a room well filled with fruit than in a room where little fruit was in storage, owing to the exhalation of moisture from the fruit which goes on continually. Eighty per cent relative humidity should be correct for the storage of apples for long periods, but we would recommend that instead of 31 or 32 degrees the temperature be carried at 29 or 30 degrees, which will mean less shrivelling than if carried at the higher temperature. Jonathan apples should keep until February or March in the best of condition if they were picked at the proper time. Immature apples will naturally shrink or shrivel when cooled down and held for some time under refrigeration, and if apples are unripe when stored the shrivelling is noticeable by January.

The Ornamental Garden

FACTS ABOUT THE VIOLET.

Few people passing a greensward decked with violets or inhaling their subtle fragrance, swept by the breeze from the garden near by, realize what a wealth of poetry and loveliness would go from the world with their exit. Now the violet is blooming, and as usual, it is the quick bright eyes of the children that first spy them, and their chubby hands that first gather them, and great happiness and new joy they bring to a child.

We older children know that the violet belongs to the order of Violaceae, the violet family, of which the principal genus is Viola-violet. There are about 20 species of the violet that are commonly known; of these 20 I have 10 in my herbarium, gathered and preserved from high school days.

The Latin name of most of the species so accurately describes a characteristic of the leaf or the flower that I will venture to give a few, believing that it will not be unintelligible, but to a few.

Viola, palmata—the hand-leaf violet, the leaf of which very much resembles a person's palm with fingers outstretched. V. pedata—the birdfoot or crowfoot violet with a leaf finely cut in narrow segments, resembling a large flat pale-violet flower, to many minds the prettiest of all the wild species. V. delphinifolia—larkspur-leaved, resembling the leaves of the garden larkspur. V. cucullata—the commonest of the blue violets, sometimes with white or variegated blossoms. V. blanda—the small sweet white violet in rich leaf-mould, clustering at the bases of big trees in the woods. V. rotundifolia—the round-leaved yellow violet found in the northern woods with many small flowers.

My best example of V. sagettata—the arrow-leaved violet, I found since coming to Texas. It has a long narrow leaf like an Indian arrow-head with the richest, deepest blue flower of any of the wild species.

The only variety of the leafy-stemmed ones I have found is V. canina, the dog violet, with creeping root, stocks and light violet flowers, with an unusually long spur. This is a very pretty violet.

Most people with no botanical knowledge whatever, know a violet when they see one, but few botanical students, even, understand thoroughly its irregular flower with its complicated stamens and pistil. And few know that in most varieties the propagation of its species is not perpetuated by the lovely flowers we see, but by insignificant little blossoms that come later in August or September. These lie close to the roots, little bud-like blossoms full of seed that burst and throw the seed in every direction. These cleistogamous flowers may be easily noticed in a bed of tame sweet violets.

Perhaps there are some that do not know that our garden pansy or heartsease is a member of the violet family —V. tricolor. It is a native of Europe, and whether the original wild ones were of only the three (tri) colors, yellow, purple and white, I do not know exactly, but still the predominating shades of the pansy today are these three same hues,—the colors of the violets, though modern progress has made great advancement in the nature of the pansy blossom.

The Greek name of the violet is Ion, and there is an old legend that the name came from Io, a sweetheart of Jupiter, of whom Juno, his wife, was so jealous that Jupiter caused Io to be changed into a heifer, that she might escape Juno's wrath and he created the violets for her to graze on. Anyhow, the Athenians who traced their origin to Ionia claimed the violet for their national emblem and it was very popular among the Romans.

Mohammed called it "flower of humility," saying that as his religion was above all others so did the violet excel in odor all other flowers. It still retains a peculiar sanctity among his followers. Reference to its virtues is found in the works of the early English authors, Milton, Bacon and Shakespeare, and we find that it was also used as a condiment and garnish in the old English days.

In the days of Queen Elizabeth, the use of strong essences and perfumes was introduced from the Orient into the English court, and high-bred ladies as well as those of low degree had their still-rooms and their violet-beds, where and from which they compounded fragrant violet waters, pastes and perfumes. They made the famous pomander-balls, silver or gold filagree hollow balls filled with crushed flower leaves mixed with spices,—a similar substitute to our rose potpourri, today.

But it has remained for modern times to create from the raising of violets and other scented flowers a practical industry. In the southern part of France, especially, where flowers bloom the year around are miles and miles of farms where the peasants do nothing but tend their posies and fit them for the markets, from which they are sent to the perfume distilleries, to the cut-flower markets or the confectioners, where they are made into bonbons. At Nice the violets are planted in beds shaded by orange and lemon trees and draw an added spicy fragrance from the perfume-laden air. Potsdam, near Berlin, is also a great violet center.

In our northern cities the florists are reaping profits from the sale of spring violets; not the simple flower of the garden of Eden, but the gorgeous purple, lavender, violet and white ones created by the florist's God-given knowledge. And here in the Southland many a girl has her violet-bed from which she gathers a little pin-money as she plucks the sweet flavors to be shipped to the cities.

The violet was the favorite flower of the great Napoleon and was adopted by the family of Bonaparte. On the triumphant return of "The Little Corporal" from his banishment to Elba he was greeted with violets, violets everywhere. Women wore violet-covered costumes, his way was strewed with the delicate blossoms, the air was filled with their crushed fragrance. But, alas, his triumph was as short-lived, comparatively, as the fresh life of the much-loved flower. But the violet had come to have such a significance to the French people that the Republic found it necessary in 1874 to prohibit, also, along with the photograph of the Prince Imperial, any representation of the little blue flower. Other noted men and women of France have been devoted to the

STAR PORTABLE DRILLING MACHINES
Drillers
Know best why they prefer a certain machine to any other make—it's not merely a notion. They want the one that will *make the most hole* in the shortest time, and with the least amount of trouble. They're exactly right.

Star Portable Drilling Machines
are conceded the standard for all Well Work, because of their construction, which guarantees them Economic, Speedy, Simple, Durable—the drillers' favorite.

ADVANTAGES OF PLANTING ANNUALS.

Then there are the annuals. We must not forget the annuals. As some one has said, to forget them would be like arranging the table for a good dinner and leaving off the condiments.

Many annuals can be grown successfully by sowing seed out of doors, but an earlier effect can be obtained by starting them in boxes or hotbeds and transplanting them to the yard when two or three leaves appear.

Of the kinds of annuals there is no end, but this is not saying that all are equally good; therefore, one does not care to experiment, and for a beginning should plant the kinds that are easiest to grow, such as balsams, larkspurs (some of which are as double as a hyacinth), candytufts, snapdragons, cockscombs, tall and dwarf, nasturtiums, marygolds, petunias, phloxes, mignonette, zinnias, sunflowers, verbenas, asters, sweet alyssum and vincas. I do not know where the investment of five cents will bring as great reward or give as much pleasure as in a packet of seeds of each of the above named plants. These one can depend on, while some of the newer sorts, or novelties, might prove a disappointment.

Several years ago I saw a yard where nothing had been planted but vincas. Two long beds about two and a half feet wide down each side fence were entirely covered, one with pure white and the other with pink. I never failed to stop and admire those beds. Through the whole summer they were indeed a thing of beauty, their glossy green leaves glistening like emeralds beneath a soft canopy of pink and white.—Farm and Ranch.

MAKE HOME GROUNDS INVITING.

All other questions sink into insignificance when compared to home and its environments. Intelligent citizenship and domestic tranquility ultimately depend upon home training, and home training is largely influenced by the environment of the home. Every boy and girl should have the advantages of a neat, attractive and comfortable home.

The expense required in beautifying home grounds is so small that it is difficult to see why so many people are contented to live and rear their children in unattractive surroundings. The residence may be a log cabin, yet it can be made attractive by trees, vines and flowers. It is remarkable how much plants and trees add to the charm of the home.

Those who do not own their homes should make an effort to secure them. Home always endears one to the country in which he lives, and insures greater interest in its social and political affairs. The home owner is more contented and can be a more useful citizen to the commonwealth.

Let us take more interest in making home life better and its environments more elevating. Build according to your means, then beautify and embellish with trees, plants and vines. Give thought to your plantings and intelligence to home arrangement. Build not only for yourself, but for your children and their descendants.—Farm and Ranch.

FLOWERS FOR THE GARDEN POOL

The small artificial pool is too small usually for any great variety of water lilies, but one will wish to have more than one color, and it is, therefore, important that the choice should fall upon those likely to thrive and do well in a slightly crowded area as, after once becoming established, the water-lilies increase rapidly.

Of course one must have some good variety of white lily, no matter what other colors must be denied. Of the white lilies there is no better variety than Nymphaea richardsonia tuberosa. This magnificant variety has immense flowers, which it bears well above the water. N. marliacea rosea is one of the best pink varieties, and is entirely free from all disease; it is one of the freest bloomers of all nymphaeas, the plants usually being in bud when uncovered in the spring and remaining in bloom until frost. It is a desirable cut-flower variety. Marliacea chromatella is a desirable yellow variety, with the good qualities. especially as regards early and persistent blooming, of M. rosea. These three are all desirable, medium-price varieties for amateur culture. Of course, if one cares to pay from $5 to $10 a root, there are many tender nmyphaeas of sensational size and colorings in which we may indulge one's taste; but I doubt if they will give more real pleasure than those mentioned.

The various Zanzibariensis lilies, among which are some beautiful blue specimens showing blossoms from six to ten inches in diameter, may be easily raised from seed and will bloom the first year, though the flowers will not be as large as they will be the second year.

The various lotus are always of great interest and may be grown with as much ease as the water lilies. Not the least beautiful is the Egyptian lotus, strong roots of which may be purchased for a dollar. This noble variety is of a deep rose color, with creamy white shadings at the base of the petals. A pure white lotus—N. shiroman—which has magnificent double flowers, may be purchased for $3 a plant, while N. perkinnenses rubrum plenum may be had for $7.50; this, as its name indicates, is a deep, double red variety. The lotus should not be grown in the same pool with the nymphaeas, as they are apt to preempt all the available space. and should be given a pool by themselves or have a corner partitioned off from the portion occupied by the water-lilies. The lotus requires more shallow water than the water-lilies, and where grown in the same pool the lotus side should have the earth raised so that not more than six inches of water is above it, while that in the lily side may be a foot or more in depth.—Country Gentleman.

Don't be niggardly with your flowers. Cut them for the house; give them to friends and neighbors; send them to the poor and sick, and the stranger. You will scatter "sunshine," and your plants will bloom all the better for your generosity.

Do not forget to gather seeds from only the finest flowers. It is well to tie a string about the stem of the most perfect blooms, and cut the rest. Watch the pod as it matures, and gather before it scatters the seed.

It is very important not to let weeds mature their seeds in the garden and vicinity. Eternal vigilance is the price of a weedless home place.

LILLY'S SEEDS

These 3 Vegetables for 10 Cents

This is not a bargain, but an introductory offer to get you interested in Lilly's Seeds, and to prove to you their quality and reliability.

LILLY'S "DELICIOUS" LETTUCE. A variety introduced by us, very early with fine, hard, medium-sized heads, rich yellow heart, with a delicious buttery flavor.

LILLY'S "EARLIEST OF ALL" RADISH. A very small, round, brought red radish with white, crisp flesh of a delicious, mild flavor. An excellent variety for cold frame.

LILLY'S "NEW WHITE QUEEN" ONION. A very early, small, round variety of fine, crisp flesh, with a deliciously mild flavir. A great favorite for the home garden, easily grown and matured.

The above three varieties are all regular 10 cent packages. We offer the three for 10 cents to introduce. Send money order or stamps.

CATALOGUE READY FOR MAILING, FREE.

Farmers are making exceptionally fine profits from beans along the Sacramento River.

Bees and Their Care

PRECAUTIONS ON WINTERING BEES.

By H. Perkins.

Now is the time to see that your bees are in good shape for winter. A colony of bees should have at least thirty pounds of honey in October to carry them through the winter. The entrance of the hive should be contracted to about three inches, to prevent the circulation of cold air in the hive, and to prevent robbing. Every hive should be examined to see that the cover fits down tight.

Above all things be sure that every colony has a queen, if you have any queenless colonies break them up or unite them with colonies which have queens. If queenless colonies are left to their fate in the fall, they soon die out, and their honey is robbed by every other colony in the apiary, and if the colony thus robbed should by chance have been diseased, the infection is spread right and left and the results are disastrous to the bees and beekeeper. For the same reasons it is equally important to inspect your bees after the honey flow if there is any bee disease in your neighborhood. A diseased colony in August is apt to be a dead colony by January and the honey from one diseased colony has often been known to infect fifty per cent of the whole apiary.

An ounce of prevention is worth a pound of cure, and it is safe to say that eighty per cent of the spread of bee diseases would be eliminated if the simple precautions mentioned here were closely observed.

BEES FOR PIONEERS.

A profitable industry is being developed on many of the government irrigation projects in the production of honey, and press reports from recent state and county fairs indicate that the quality of this honey is superior. The flavor is exceptionally fine and the color clear and sparkling. Alfalfa is the chief source from which the bees secure their supply, and as it blooms constantly from early spring until late in the fall, the bees have something to work on all the time, allowing a greater amount of honey to be stored.

Many of the projects are located in famous fruit sections and the combination is found to be of mutual advantage. The trees furnish an abundance of honey during the blossoming period, and orchardmen state that the economic importance of the bee from the standpoint of its value in the pollenization of fruit, cannot be overestimated. White clover and small fruits, and in the plains regions many varieties of wild flowers, also furnish sources of supply.

The bee industry is a lucrative side line for the regular farmer, but there is also a wide field for the bee man on these projects where everything tends toward specialization and where the farmers organize for the standardization and marketing of their crops. On nearly all the projects small tracts for the purpose may be purchased at reasonable rates. On many of them there are model towns laid out at intervals of a few miles. The business lots are grouped around a central square, and near the outer boundaries of the townsites the lots contain several acres each. These large lots, surrounded by wide areas of new agricultural lands devoted largely to the raising of alfalfa, are ideal locations for apiaries. They are sold at very reasonable rates, and afford opportunities for engaging in a business which pays large returns on the investment. The average price of bees in the West is probably about $5 a hive. The manager of a large apiary on one of the irrigated tracts gives the average production of his hives as 76 pounds of surplus honey per annum. At ten cents per pound the returns would be $7.60. In addition to that the increase averages 100 per cent from year to year, doubling the original investment and making a total of about 150 per cent profit each year on the original investment.

PRODUCTION OF PRECIOUS STONES.

It may perhaps be surprising to many people to learn that the United States produces almost every variety of precious stone—from diamonds down. The precious stones produced in this country last year had a value of $295,797, against $534,380 in 1909, according to an advance chapter from "Mineral Resources of the United States" on the production of gems and precious stones in 1910, by Douglas B. Sterrett, just published by the United States Geological Survey. The large decrease in the output of a few of the more important gem minerals—tourmaline, turquoise, chrysoprase, etc.—says Mr. Sterrett, readily accounted for the fall in the value of production. As an instance of this decrease in production, about 8½ tons of rough turquoise were produced in 1910, as compared with more than 17 tons in 1909.

All the diamonds produced in this country in 1910 came from Arkansas and California, the output of Arkansas amounting to about 200 stones. Several diamonds were found in California last year, one of which weighs about half a carat and another between 1¾ and 2 carats. The latter is a brilliant, clear, flawless stone, with a tinge of yellow.

Colorado yields some very pretty agates and some are being successfully handled in the tourist trade, but a number of these stones sold each year at the summer resorts of the state are imported from Germany, where they have been polished. Others are native stones polished abroad, although some are polished in the United States.

In Montana a sapphire weighing over 4½ carats has been found. This stone when discovered had very much the shape of a rough diamond crystal, on account of which it had very great refractive power.

Bees like to work better, probably, than any other living thing. They are perfectly willing to work for nothing, board themselves, and pay handsomely for the privilege of occupying an old box.

Bees cannot carry on their wonderful work without water. If they have not access to natural sources in the vicinity of the apiary, water should be given to them.

If ants are noticed on plant or shrub be sure that they are after an insect foe, and just now the aphis is their favorite food. Spray the plants with clear water, then sift on tobacco dust.

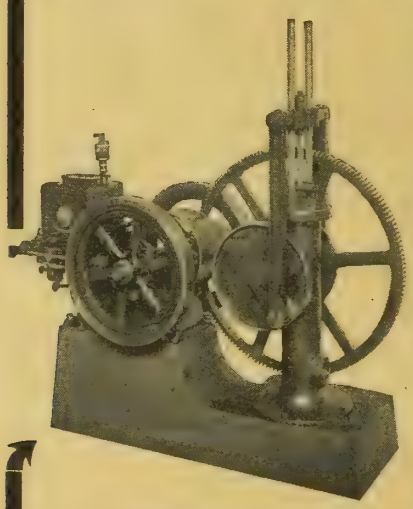
Have You Seen Gregory's Triumph Engine

With Direct Connected Pump Jack?



If you have not, you have not seen the latest thing in a perfect little pumping plant. Note the simplicity of this jack; direct lift each side of the piston; no wobbling or jerking, but a smooth, even stroke. Engine is fitted with pulley, so that you can run the washing machine, the churn, the cream separator, and be such a handy little helper about the place.

We have them in 1 and 2 h.p., and don't forget that we carry a very large stock of engines and pumps of all sizes. Come and see us, or send for catalogue.

WM. GREGORY, Sales Room

602 to 606 N. Main St., Los Angeles, Cal.

Pioneer ROOFING

Time to Make Repairs

Are your roofs in condition to withstand the winter rains? Pioneer Roofing is positively unexcelled for repairing *or replacing* old and leaky roofs. Easy to lay. No special tools needed—no experience. Comes in handy rolls of 108 square feet. If your dealer doesn't handle Pioneer Roofing, send us his name and we will see that you are supplied. Write for booklet and samples. Both are free.

PIONEER PAPER COMPANY

Irrigation and Forestry

WHERE DOES YOUR IRRIGATING WATER GO.

By G. W. Waterbury, Corona.

Three years I spent in studying the effects of fertilizers on our semi-arid soils; I wanted to get the most for my money out of every pound that went into the land. As I watched the effects I saw that unquestionably there was another factor, and a big one, too, that entered into the making of any fertilizers effective, and that factor is water. Without a suitable supply of moisture a maximum benefit cannot be derived from the fertilizers already applied, no matter in what amounts applied.

Taking the average rainfall of the citrus belt of Southern California as twelve inches and allowing eight irrigations during the rainless season, the total annual amount of water placed on our groves is about 45 inches, an ample amount if every drop of water could be made to do its duty. However, a certain portion must be allowed for downward percolation and, we regret to say, a far larger portion lost through evaporation during the long dry months of the summer. For this loss we are, to a great extent, responsible.

For the even texture of the fruit, for the thrifty appearance of the tree and especially for the rapid building up of citrus trees formerly dormant, or long neglected, water in large quantities is absolutely essential. In the lemon orchards, in order to get the fruit quickly up to size, to prevent tree-ripening (always a loss financially) and to promote that vigor of limb and healthy color of leaf always noticed in the best lemon groves, water, a constant, ever present quantity of water, must always be held in the soil. Of course, I refer only to deep and well-drained soils, the only kind any citrus grove should ever be planted in.

What becomes of the water? Ask any citrus grower this question and the answer ninety-nine out of a hundred times will be the same. He does not know and I did not know; the remedy is found in the strenuous application of shovel and mattock two and three days after irrigation. With knowledge should come understanding.

The practical tests were made by Mr. W. C. McCully and myself, at Mr. Flagler's El Cerrito ranch in Corona, last September, on a representative strip of sandy loam soil. Before irrigation I had the furrows changed between the trees one hundred feet below the flume so that the water in places was diverted in double winding furrows about the trees, in others led directly by; in places two, in others three furrows between the rows of lemon trees that stood 20 feet apart. One furrow was made deep and almost flat along the lower surface in contrast to the others made by the pointed furrowing plow. There was a 30-inch flow of water on that ten acres for forty-eight hours, each furrow receiving the same amount of water and three days after the water was off the results were noted.

Mr. McCully had his Mexicans dig trenches two feet wide and four feet deep from tree row to tree row cross-cutting through every bit of soil where the water had gone. At eight inches a 3-inch plowsole was quite noticeable and just below this was the greatest amount of moisture where the furrows were far apart, or four to the row; where they were closer, five or six to the row, more moisture was above the plow hardpan. Under the broad, flat furrow the water had gone noticeably deeper and more was under the plowsole than in the case of the narrow furrows.

The greatest surprise was in the narrow width the water had spread to during the 48 hours' wetting the land had received. No place under the cultivated strip could much moisture be found over one and one-half feet from the sides of the furrow above, that is, in sufficient quantities to remain compacted when once pressed together in the hand. At three feet the water that had percolated from the recent irrigation ceased and at four feet the spread of water, though slight, was quite diversified, showing an equal and rather permanent distribution.

The spread of roots seemed always to be in proportion to the amount of water entering the soil, even though the sides of the tree receiving little of the irrigating water from directly above had been fertilized from year to year in the past. The greatest number of feeding roots were from one to two feet from the surface. In places where the water had periodically run, I found 60 to the square foot; between the irrigating rows 30, or one-half as many as where water was plentiful. There was no change in the physical condition of the soil in our trenches; its value to the tree simply a matter of where the most water and fertilizer was to be had. The water had been run on this section every 28 days during the spring and summer months.

On another section, Mr. McCully had the water run for four days and nights continually and then well cultivated and left for six weeks. Cross trenching this section from tree to tree, several weeks later, shows the soil in perfect condition, the water well spread and no dry spots down to a depth of four feet. In fact, the moisture content of the soil could hardly have been improved.

From these practical illustrations I draw the following conclusions, based on soils such as I have described: Water distributed in furrows well around the tree, get all sides to working instead of but two; keep the water away from the top surface by getting it down where evaporation is slight; irrigate less frequently but with more water. Put into the soil all it will retain and keep it there by thorough and deep cultivation. In this connection I will add that the present form of chisel-tooth cultivator will have to go in those heavy soils where plowsole is getting to be a permanent evil, shutting off the easy percolation of both winter rains and summer irrigating waters. The constant scraping of the tooth cultivator on such soils is annually intensifying the faults already brought on by the plow. In its place a rotating spader, that will both cut through the plowsole and at the same time liven up and leave the ground in a nice friable condition is preferable.

NEW FOREST LEGISLATION IN ITALY.

Previous to June, 1910, when the law on the state forest lands was promulgated, Italian Forestry questions were regulated by the law of 20th June, 1877, and some others of less importance. The law of 1877, with a view to ensuring the stability of the soil, a good water system, and, secondarily, good local sanitary conditions, forbade all deforesting and clearing of forest soil, subjecting to the vincolo forestale (forestry regime) the woods and lands denuded of trees on the summits and slopes of mountains, down to the higher limit of the chestnut zone, as well as those that by their character and position, might, if deforested or cleared, become a public danger.

The law further instituted, in every province, a forestry committee, presided over by the prefect, to settle the rules for forest cultivation, wood cutting and other delicate matters. But, in spite of these provisions, there was reason to lament an excessive and ill-regulated deforesting, giving rise to landslips, devastating torrents and floods, often producing serious crises in the economy of the mountain regions.

The necessity for special remedial measures was then apparent. Some of these were provided in the law of 2nd June, 1910, "On the state forest domain and the protection and encouragement of Forestry;" others are contained in two bills (30th November, 1910); the first on Modifications of the forestry law of 1877 and provisions for mountain pastures and agriculture, theond on "Forestry train."

The main article of the law of 2nd June, 1910, is the formation of a state forest administration as an independent institute, "to provide for the extension of forest cultivation and the trade in national forestry produce by increasing the state forest property and rendering it inalienable and by the example of a good industrial regime."

The domain is formed: (a) of state forests already declared inalienable; (b) of state forests at present administered by the finance department; (c) of state lands held to be economically only suited for forest cultivation; (d) of wooded lands purchased by the forest domain institute or in any way becoming the property of the same; (e) of treeless lands purchased or expropriated by teh same; (f) lands reafforested or to be reafforested, by virtue of special laws, by the department of public works, and that the agricultural department shall think fit to incorporate in the domain.

Woods and lands that thus come to form part of it are inalienable, and must be cultivated and utilized according to a regular economic plan, approved by the minister of agriculture, industry and commerce.

Art. 17 of the law is especially interesting. It authorizes the forestry administration to receive advances and loans from the land credit or agricultural credit institutes and the savings banks.

For the protection of forest cultivation, it is provided that the woods belonging to the communes, the provinces, public institutions, corporations associations and limited liability societies must be utilized as prescribed by the forestry authority.

For reafforestation of severely damaged woods, the department is authorized to direct gratuitously the technical labor and to give prizes of from 50 to 100 francs per hectare.

Lands, bare or covered with bush or grass, when they are scientifically reafforested by their owners or by consortiums of owners, are exempted from the land tax for 15 years, if cultivated as copsewood, for 40 years, if cultivated for the production of full grown trees.

The central or local forestry authority further gives gratuitous assistance to the forest cultivators for the defence of small mountain properties and encourages the foundation of associations and consortiums of forest proprietors.

The sum of 33 million francs has been assigned for the carrying out of the law during the first five years; at the end of which period the amounts necessary each year will be inscribed on the agricultural estimates.

To complete this fundamental law, the two bills above mentioned were presented to the chamber. By the first, provision is made for a more scientific system of preserving the woods and grazing lands and for the increase of forest industries. The vincolo forestale is modified in accordance with the dictates of science and practical experience, and the provincial forest committee reorganized with the participation of persons technically and legally qualified. The criterium of the chestnut zone, hitherto taken as the limit of the lands of the forestry regime, is consequently abolished. Other provisions deal with the penalties and the conciliation institute for contraventions of the forestry regulations.

Finally, a very important and novel portion of the bill relates to mountain pastures. It establishes subsidies for the creation, improvement and regulated use of the grazing grounds and mountain meadows and for the works connected with the regulation of the water supply. The period damaged grazing grounds must lie fallow is also regulated; this naturally causes a break in the owner's use of them, but he receives adequate compensation during the period the state is arranging for the restoration of severely damaged grazing grounds.

The second bill has reference to "forestry training;" in it the foundation of a "higher forestry institute" is proposed, the principal object of which is to provide for the superior technical instruction of the forestry officers required for the service of the special state forest domain institute and for the application of general and special forestry laws. It is also proposed to institute a "royal forestry experimental station," to assist in the progress of forest cultivation by means of scientific and technical research. Finally, provision is made for secondary forestry training, itinerant teaching and for the training of the forestry guards.—Summarized from the Bulletin of Economic and Social Intelligence, published by the International Institute of Agriculture.

IRRIGATION PROBLEMS

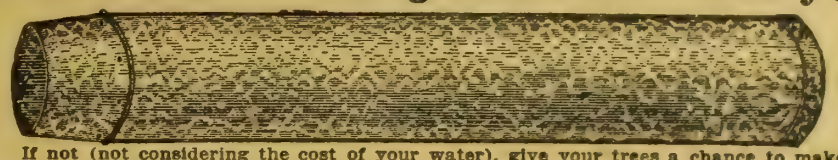
The continual cleaning-out of weedy ditches is but one of the disagreeable and expensive features of the old-style Irrigation Methods.

Why waste time and money in this way, or in costly experimenting, when the experience and advice of Irrigation Experts is yours for the asking.

The ***"K T System"*** will solve this, and all your Irrigation Problems. Just ask for the 6th Edition of our Brown Book (*free*).

THE KELLAR-THOMASON MFG. COMPANY
1226 East 28th St., Los Angeles, Cal.

Is Your Mode of Irrigation Satisfactory?



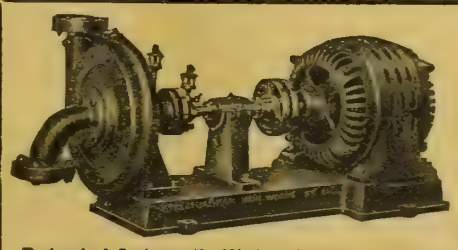
If not (not considering the cost of your water), give your trees a chance to make good by giving your orchard the proper amount of water all over same, and not three-quarters of your water supply within forty feet of your head flume.

The surface irrigating pipe we manufacture will remove this obstacle—will cut your water bill—is more convenient to use and will last a life time.

Write us, stating your requirements and we will cheerfully furnish you with prices and information desired.

We also manufacture Ells, Tees and Gates for this special pipe and are in a position to manufacture any special fittings you may require.

THE AMES IRVIN COMPANY Corner Eighth and Irwin Streets, San Francisco, California



Patented Automatic Water Balance Irrigation Pump, direct connected to electrical motor, self-operating.

IRRIGATE

Your land by means of Electric driven centrifugal pumps.

They are absolutely noiseless and have neither rods, valves nor gears to get out of order.

CONTENTS THIS WEEK

FOOT BRIDGE IN CALIFORNIA FOREST, Cover.

SPLITS OF THE NAVEL, 449.

CITRUS AND TROPICAL FRUITS.—Tariff Campaign; Melanose; 450, 451.

DECIDUOUS FRUIT CULTURE.—Morning Glory; What Emmer Is; Apples in Storage; 452, 453.

ORNAMENTAL GARDEN.—Facts About the Violet; Advantage of Planting Annuals; Home Grounds Inviting; Flowers for the Garden Pool; 454, 455.

BEES AND THEIR CARE.—Precautions on Wintering Bees; Bees for Pioneers; 456.

IRRIGATION AND FORESTRY.—Where Does Your Irrigating Water Go; New Forest Legislation in Italy; 458, 459.

EDITORIAL.—Deciduous League; Exterminating a Pest; Poultry; Another Early Orange; Juicy Joys; State Commission; Florida's Green Oranges; Soil Fertility League; Beet Growers Want Justice; 460.

AGRICULTURAL NEWS NOTES OF THE PACIFIC COAST.—Northern; Central; Southern; The Coast; 461.

LIVE STOCK AND DAIRY.—Settlers' Questions; Milk Inspection; 462, 463, 464.

PROFIT IN THE POULTRY YARD.—What to Do With Choice Cockerels; Colony Houses; New Style of Hopper; Disinfect Eggs; 465, 466, 467.

GENERAL AGRICULTURE.—Agricultural Statistics; Dynamite in Farming; 469, 470.

VETERINARY.—Cough; Diarrhoea-Bloat; Shying in Harness; 471.

QUERIES.—Pheasants; Curing Walnuts; Potash on Prunes; Foxtail; Roadside Trees; Aliens Owning Land; Lizards; Lime on Gravel; Loam; Preserving Fence Posts; 471; 472.

HOUSEHOLD.—The Girl Who Smiles; A Planned Affair; Veranda Reflections; Swiss Steak; 473, 474, 475.

PRODUCE MARKET.—Los Angeles Market; San Francisco Market; Deciduous Market; Citrus Market; 476, 477.

DECIDUOUS LEAGUE.

Dispatches announce as the result of a big meeting of fruit growers at Newcastle on Monday that the deciduous fruit districts have decided to extend the fruit standardization scheme, and also to organize the Deciduous Protection League. This organization will be in charge of former State Horticultural Commissioner J. W. Jeffrey.

EXTERMINATING A PEST.

The latest publication from the agricultural experiment station at Berkeley is Circular 69 on the extermination of morning glory by Frederick T. Bioletti. Several illustrations are used with the text, and all told, with the 12 pages making up the circular, a fund of information is given which will be valuable to those who have places infested.

POULTRY

The preliminary statement of quantity of live stock in the United States shows the value of poultry in this country in 1910 to be $153,394,142. This is an increase of nearly $70,000,000 in the decade. As to numbers in the different classes we may add that there were reported for chickens 5,577,218 farms with 280,340,000 birds, for turkeys 852,000 with 6,888,000 birds; ducks 503,000 with 2,904,000; geese 661,000 with 4,341,000; guineas 339,000 with 1,765,000; pigeons 99,00 with 2,730,000.

ANOTHER EARLY ORANGE

Imperial Valley announces that its first navel oranges will be offered in the Los Angeles market on November 10th. Arizona has heretofore furnished our highest grade of early oranges and Imperial Valley conditions closely resemble those of Arizona. It is possible some of these "lowest down orange groves in the world"—meaning altitude, of course—will yet be producing some of the highest grade oranges. Butte County and Tulare County are shipping early, well-colored fruit, but Arizona seems to be receiving high prices.

JUICY JOYS

The Florida Citrus Exchange is mailing advance proofs of the "Juicy Joys of Florida Fruit", which it adds is "stored sunshine suggestions," a bunch of fruit recipes. We notice that in the first few paragraphs the word California appears almost as often as does Florida, for example: "Florida oranges are best because they are the juiciest, containing from 40 to 60 per cent more juice than California Navels." However, this is a compliment to California oranges, for the entire circular shows a desire to hold up the Florida oranges to as near the standard as possible, California, of course, furnishing the standard.

The booklet contains several suggestions as to buying, keeping and eating citrus fruits, and many recipes from Tangerine Bouillon through the whole list to Florida Orange Candy.

STATE COMMISSION.

Mr. E. O. Essig, formerly horticultural commissioner of Ventura County, and one of the hardest workers who has ever taken up the enforcement of quarantine laws in this state, has gone to Sacramento, presumably to act as secretary to the new horticultural commissioner, Prof. A. J. Cook. Mr. Essig is abundantly qualified to take up this work and we believe he will be a great factor in the enforcement of the quarantine laws of the state.

Mr. Frederick Maskew arrived in Los Angeles from Sacramento last week to take up his new work of deputy state quarantine officer for Southern California. He will have charge of all the quarantine work in Southern California with special oversight of the harbor of San Pedro. Mr. Avery S. Hoyt will be in charge of the San Diego office and Mr. C. H. Vary, formerly Los Angeles County inspector at Pomona, will assist Mr. Maskew in the work at Los Angeles.

We are glad indeed to know that Miss A. G. Bird, efficient clerk of the office for years, beginning under Elwood Cooper, is to be retained.

As we go to press we are informed of the appointment of G. E. Merril, of San Jose, formerly of the United States Agricultural Department, as Chief Deputy State Horticultural Commissioner; also of the appointment of E. J. Newcomer, recently of Stanford, who is to be assistant under E. K. Carnes, who the dispatch announces will be retained as superintendent of the state insectary. The same dispatch announces that O. E. Bremner will remain in charge of the San Francisco office, and will be assisted by Messrs. Compere and Whitney.

FLORIDA'S GREEN ORANGES

The shippers of Florida oranges have had a jolly scrap on all through the earlier shipping season. The Fruit Exchange, co-operative and on identical lines with the California Fruit Growers' Exchange, took the stand that green fruit shipments must stop. It went to its own state legislature and urged the passage of a bill which aimed to control the shipping of green fruits. When shipping began it worked under this state law and under the rulings of the pure food commission. It circularized the trade, warning against receiving green fruits. This action led to the charge that the exchange was no friend of the producer and was frightening the trade. The exchange, on the other hand, maintained that the trade had been worse than frightened in past years by sour and unripe fruit. It has won its point and now Florida is sending out fruit which is being received well by the trade and creating a demand for more of the same kind.

California shippers have listened to the song of the siren of big prices for early and immature fruit and have been restrained with difficulty, but we believe all along the line this year there has been greater care. This may in part be due to Wiley, but more to common sense, for if the shipping of green fruit is stopped the entire industry will receive better returns.

SOIL FERTILITY LEAGUE

The latest organization looking toward an "uplift to agriculture" is the National Soil Fertility League with headquarters in Chicago. We note that its advisory committee consists of President William Howard Taft, various presidents of railways, and even the president of the Federation of Labor, but mighty few farmers. The list is saved by the two names carefully placed at the end, those of Henry Wallace and W. D. Hoard, both the best of friends of the farmers and the best of farmers themselves.

The league announces as its purpose "to secure the general application of scientific methods of agriculture and by these to increase vastly the yield per acre of farms." It invites all citizens interested in the promotion of the general welfare of the country to assist in arousing public interest in this "nation-wide movement." The statement is made that the Old World's average per acre is from two to three times as great as the 14.3 bushels per acre produced in the United States, and this upon ground that has been tilled for centuries." One solution of this problem is the inducing of farmers to secure the knowledge offered by the Department of Agriculture and the various state experiment stations and put it into practice. The Department of Agriculture was created many years ago to help the farmer to get better returns. It is doing some excellent work, but too few farmers take advantage of the information which is theirs for the asking. The circular also suggests that field demonstration is necessary. The local conditions of the farm must be considered. One very definite suggestion is that each one of the 3000 counties, considered agricultural counties in the United States, be given an expert demonstrator at a salary of $3000 per year, or a cost for the whole United States of $9,000,000, the price of only one battleship, or ten cents per capita. With our annual crop valuation of about $100 for each person in the United States, it may readily be seen that if that crop could be doubled or even increased 50 per cent, it would be a great step toward feeding the world.

Our first question would be, "Where are the 3000 competent instructors to come from?"

BEET GROWERS WANT JUSTICE

It is reported that Secretary Wilson has said that the efforts on the part of the government to put the sugar beet industry in a more satisfactory condition have not succeeded as was anticipated by its well wishers. It is further intimated that the Secretary hopes that the Department of Agriculture may get hold of the situation in a way that will increase the output.

Southern California has proven so remarkably well adapted to the growing of the beet that production has increased in that section more rapidly than in any other portion of the United States. Other sections of the state are experimenting and hoping to have the same growth. Meantime the price of sugar mounts skyward. Now the housewife receives only about eleven pounds for $1.00. Compared with prices 100 years ago this may be considered exceedingly low, for at that time beet sugar was made at a cost of about 80 cents per pound and the amount extracted from beet roots was four or sometimes as high as six per cent. Even then, the method of refining was so crude that only about one or two per cent of the weight of the beet was secured in sugar. Since then, both method and cost of production have materially changed, as have method and cost of growing a ton of beets, but the advantages have gone to the manufacturer rather than to the grower. Congress has been used as a tool to protect the manufacturer, but not the producer, except in the infinitely small way of taking what the manufacturer saw fit to allow him.

Recently Southern California planters have organized and are insisting upon their rights. They should be given treatment which will encourage them to remain in the business of beet growing. The manufacturing should be a business by itself and conducted by those whose life work it is, but if the growers are denied justice, then co-operative manufacturing is possible. It must be admitted, however, that the manufacturing of beet sugar involves a great outlay of capital. How great we do not know, for many who appear to be informed, state that it is no such figure as has been claimed by manufacturers. But co-operation is proving more and more successful every day, and if the growers are forced to it they can show co-operative sugar factories.

Whether the government can take a hand in this matter through its Department of Agriculture, we do not know, but the time is ripe for a thorough discussion of the subject.

Agricultural News Notes of the Pacific Coast

Northern California

The horticultural course at Davis is now on in full swing.

Corning, Tehama County, reports some oranges ripening and already going to market.

A drainage ditch is being planned for lands west of Gridley. It will reclaim about 10,000 acres.

The management of the Oroville Orange and Olive Exposition is getting ready for a great display.

Biggs, Butte County, is harvesting its rice crop. There are 50 acres in Japanese rice and 25 in Egyptian.

An east Napa grower raised 300 tons of tomatoes on 26 acres. Most of them were sent to the cannery.

The hop market at Ukiah is exceptionally strong and large sales have been made, some as high as 41 cents.

A rain visited the orange growing section of Butte County last week and orange growers are happy as a result.

An investment of 150,000 is promised for the irrigation and development of a large tract near Oroville.

The Petaluma Poultry Keepers Association is offering a fine list of prizes for its show to be held next month.

The Fish and Game Commission is after the salmon catchers in the Russian and other rivers of the northern coast counties.

St. Helena, Napa County, has recently established a catsup bottling establishment which is proving a successful venture.

A fine growth of cotton has been produced in Biggs, Butte County, and it is possible more extensive planting will be made later.

A colony of several families has begun development of a 500-acre tract near Palermo, Butte County. The people all came from Middleboro, Mass.

Cloverdale's annual wool sale which took place on October 21st was not a success, as only two buyers appeared and prices were so low that no sales were made.

The California State Floral Society gave an exhibit in San Francisco last week which was characterized as "one of the most beautiful collections of flowers ever assembled in the city."

Expert Husmann of the Viticultural Investigation, Department of Agriculture, is inspecting the vineyards along the American River. Mr. Husmann has developed several new varieties of grapes.

It is claimed preliminary steps are being undertaken for the largest irrigation project in the United States, in Tehama, Glenn, and Colusa Counties. Rumor has it it is backed by a corporation with $300,000,000 capital.

At the meeting of the Northern California Teachers' Association the matter of teaching farming in the schools was discussed by Mr. Crosby of Washington while some teachers emphatically endorsed the old system of education.

Having quarantined all fruit from the Hawaiian Islands excepting bananas and pineapples, the state commissioner has made a ruling that those fruits shall be packed in materials in which there is no danger of the fly being found.

Central California

Newman, Stanislaus County, wants a creamery.

Merced farmers are already seeding on summer fallow.

Lindsay's first car of oranges this season went to Manila.

Tulare County orange growers are shipping heavily of early Navels.

Merced County grain farmers report last season as exceptionally profitable.

The Randolph Fruit Company is building a new packing house at Exeter.

Practically all raisins have been taken from the trays and are in sweat boxes.

Porterville is having a scare over rabies and is now engaged in chasing mad dogs.

A pomegranate grower at Porterville sold his crop of pomegranates at $140 per ton.

Three Rivers, Tulare County, is making a showing of some exceptionally fine Winesaps.

One grape grower at Exeter reports return of $250 per acre from his four-year old Emperors.

Exeter has shipped ten cars of Emperors and is still forwarding some exceptionally fine fruit.

The Citrus Chamber of Commerce of Tulare County was entertained by Dinuba people last week.

The Chamber of Commerce of Madera has appointed H. H. Whitmore secretary for the coming year.

The orange growers of Tulare County are picking fruit later than usual on account of the pure food ruling.

The directors of the Fresno County Fair Association are pleased with the net profit of $1630 for the last fair.

Three quarters of the honey crop of Kings County has been bought by one San Francisco firm for $115.50 per ton.

One hundred and fifty dairymen and officials of the Pomona Grange of Tulare County met in joint convention and stock exhibit.

Some Tulare County orange growers are finding orchards infested with brown scale and are taking up the matter of fumigation.

Bouldin Island on the San Joaquin River not far from Stockton and containing over 6000 acres of rich land is about to be reclaimed.

Grape growers now generally concede that early shipment of green grapes this year caused immense loss to shippers of ripe grapes later.

A new packing house company has been formed at Lemon Cove, Tulare County. The capitalization is $20,000 of which $7.00 has been subscribed.

The Raisin Day Committee of Fresno has agreed to furnish raisins sufficient for 5000 loaves of bread for the shriners "Country Store" in Los Angeles.

A Stanford chemist claims he has a way of stopping destruction to growing plants by fumes of the smelters. If this be true it will save millions to this state.

The efforts of the orange pickers of Tulare County to have an inspector appointed by the pure food commission to pass upon the ripeness of oranges before packing, has failed.

Southern California

A dairy farm near Covina is importing some fine Jersey stock from Wisconsin.

One chili dryer near Anaheim lost three dry houses by fire last week. Loss was about $2500.

Expert Thurston of the U. S. Department of Agriculture is inspecting dairies in the Riverside section.

One bean cleaning establishment at Ventura is employing 65 men and women in cleaning and sacking beans.

Orange County is more or less concerned over the prevalence of rabies, both dogs and horses having been attacked.

A large orange orchard in the Rialto district, San Bernardino County, is about to be sold to a syndicate for $100,000.

The Anaheim sugar factory having closed because of scarcity of beets will soon reopen to run through its waste molasses.

Some Coachella Valley and Imperial Valley dates have this year sold in the Los Angeles market at as high as $1.00 per pound.

Walnut growers at Hemet, Riverside County, are forming an association to affiliate with the Southern California Association.

An all-day meeting of cantaloupe growers and shippers was held at Brawley last week and contracts for 5000 acres were signed up.

The San Fernando Valley will grow more beets for the Oxnard factory. Workmen are now engaged fitting 8000 acres for next year's planting.

Lemon growers of the Escondido Valley estimate they will ship at least fifty cars more of lemons than last year. Last year's output was 250.

Those traveling through the mountains of Southern California report a shortage of pinon nuts. Last year's output was one of the heaviest ever.

Capitalists interested in sugar manufacture are inspecting the San Luis Rey section of San Diego County, and landholders are hoping for the establishment of a beet sugar factory.

The state forester contemplates a step in reforestation in connection with work by the city forester of San Diego. The city owns about 7000 acres of land which it is hoped to plant.

The orange growers of Colton, San Bernardino County, have succeeded in the supreme court in their case against the cement works, the dust from whose plant proved an injury to the orange trees.

The Mutual Orange Distributors of Redlands reported at its recent annual meeting the distribution of 3170 cars of fruit during the last season. The total return for these shipments aggregated $3,612,174.89.

Cantaloupe growers of the Imperial Valley are finding it hard to perfect their co-operative marketing organization, but the effort is still being made and it is hoped to have it in good working order before the next crop.

Two cars of walnuts from Anaheim, Orange County, were put up in the New York market in competition with nuts from Southern Europe and sold above the foreign nuts. Still better, brokers wired for "more like sample."

The Coast

Oregon's total wool clip is 18,900,000 pounds.

The creamery at Roseburg, Oregon, has suspended.

Bee keepers at Hermiston, Oregon, report an excellent season.

Forty families from Texas are now locating at Albany, Oregon.

One sale of 8000 head of lambs was recently made by stockmen at Lakeview, Oregon, for $2.25.

A 12-mile flume will be constructed to conduct waters to the lands near Wenatchee, Washington.

A Walla Walla, Washington, potato grower has invented a machine for sorting potatoes, onions, etc.

Stock growers at Carson, Nevada, are complaining of great havoc in their herds from mountain lions.

It is claimed the government will spend $50,000,000 in irrigating Washington lands. This will reclaim about 1,500,000 acres.

At the fourth national apple show at Spokane on its closing day, November 25th, there will be 100 elaborately decorated floats.

The second annual Pacific Northwest Live Stock Show will be held this year in Portland and $6000 in premiums is being offered.

One nursery at Spokane, Washington, has just received an order for 100,000 apple trees, said to be the largest single order for apple trees.

Because a single walnut tree at Vancouver, Washington, is netting its owner $10 a year, real estate agents are boosting for the walnut industry.

Garfield, Washington, has produced on an average 50 sacks of potatoes per acre and the growers are receiving an average of about 70 cents a sack.

The wool season just closed at Portland, Oregon, has not been satisfactory to the sheep men. It is thought the tariff agitation has affected it unfavorably.

A movement is on foot at Kennewick, Washington, to secure a large number of high-class dairy cows and give to the dairy and creamery business an impetus.

An effort is being made to change the name of Christmas Lake Valley in Oregon to Pleasant Valley. The idea is that Christmas sounds too much like cold weather.

Washington irrigators are hoping for improved conditions under a new law which is to have more control over irrigation companies which are supplying the needs of the irrigators.

What is claimed to be the largest sale of hops ever made was that of 15,000 bales, or about 2,850,000 pounds, in Oregon last week. The sale amounted to something over $1,000,000.

The average yield of hops in California in 1909 was 1430 pounds per acre. This brought $206.30 to the acre. This year's returns will be doubtless greatly in excess of that figure.

Complaints by settlers on certain lands in Oregon that they have been denied irrigating water has been the occasion of the calling of a meeting of the desert land board, Central Oregon Development Company and certain settlers on the company's lands.

Easy Money For the Dairyman

Your money comes directly out of your cows. It makes a wonderful difference to your pocketbook whether your cows produce much or little. Have you ever realized what even one quart a day more from each cow means to you? Say three cents a day—that's more than $10 a year. With only ten cows it means $100 a year. Looks pretty big all in a lump, doesn't it? Now it's just "easy money" to get that extra quart, and oftentimes two quarts, by a simple and cheap change in your feed.

We are blessed in this country with nature's richest gift—"Alfalfa," which we all agree is an unrivalled feed for a dairy cow—but even the best should not be used alone—cows, just like human beings, need variety. Alfalfa is rich in protein, but is light in carbohydrates. A cow, in order to make the most milk, must have in her ration a sufficient amount of both classes of feed.

In Steam-Dried Beet Pulp is found the ideal combination with alfalfa to make a properly balanced ration. It is light, bulky, succulent and easily digested, absorbs water very quickly and swells to about six times its original bulk. It is cheaper than bran or rolled barley and produces better results.

The combination we recommend is 8 lbs. of Steam-Dried Beet Pulp with all the alfalfa hay the cow will eat, which will be from 15 to 20 lbs. daily. It has also proven to be a splendid green food for poultry. They are extremely fond of it.

STEAM-DRIED BEET PULP
Just Like Roots
Makes More Milk

Steam-Dried Beet Pulp is just the clean beets from the sugar factories (only the sugar extracted), which is **dried by steam.** Be sure you get the kind that's **steam dried,** always uniform in color and quality, never burned or blackened by smoke, always clean and pure. It is packed in 100-lb. sacks and will keep indefinitely.

Progressive feed dealers are rapidly placing Steam-Dried Beet Pulp in stock. Ask your dealer for it. If he does not keep it, write us. We will see that you are supplied promptly.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

SETTLERS QUESTIONS.

By Mrs. M. E. Sherman.

The first one is of the land. What are the natural indications of good and poor land? Where the land has had moisture to grow weeds this growth will show the character in a small way. Alkali in land will show the familiar weeds when in a small degree. When it increases, the growth is salt grasses, then more alkali and the sedges take the place of salt grass. After the salt grasses and sedges find the land too strong for them, the white spots or black ones will show. Black alkali oftener deceives the purchaser than the white. When the land is plowed the black alkali makes it look richer and moister; to the easterner it looks better than the lighter colored sandy soil around. The growth that indicates moisture and also good land in the valleys has plenty of sunflower mixed, and on that a little drier, the tar weed and blue curls come in late summer to show the quality of the soil.

Knocking.

In every district of the state are passed over pieces of land that have been knocked year after year by the neighbors, until no one believes them any good. A few years ago, say twenty-five, the weed patches of Kern were thought only fit for homesteaders. The wonderful fertility of this soil with its accumulated humus of rotted down weeds produces bumper crops. All over California are districts that are producing today crops that we have to be "mum" over, or the public, that does not know, think we are members of some Ananias club. The intelligent perception of the things under the soil has an example, in the genius that found the moisture under the white sand in the land near Ontario, now one of the best of vineyards. This man dared popular opinion and has secured, by using his own eyes, a princely property. This, too, was in an already old settled district. Another instance—not to multiply them until it becomes tedious—is Atwater. This land was considered too light by the older settlers. A new arrival looked the land over and a vision came to him of the sweet potatoes covering the land with green vines. These first planters were poor men who often paid for their land with a couple of crops. Then, while potatoes were just as good paying, the value of the land rose in jumps and bounds. Now, there are many other places still waiting for the man with eyes to see the vision of prosperity that is yet to come. Can you not be one of these men? If you will, think and think until the mind actually is filled with ideas that come teeming to its aid. We all have an unused amount of knowledge that can be capitalized.

Hardpan.

Stop knocking and go to work on a piece of land. The early comers picked the more moist soil as easier to cultivate and as giving returns at once. The earlier planting of orange trees in the valley on these lands has been pushed aside in some instances by the planting of the higher and seemingly less desirable pieces of mesa. Then came the finding out that the lower moister lands were frostier than the higher ones, and that there were frostless belts along all the foothills that only needed water to be productive. In the valleys proper were many pieces of red hardpan soils. These nearly involved the United States with Holland in a diplomatic struggle over colonies that were brought out to make homes on this land. The same lands today are thriving places with bearing orchards and vineyards. This form of hardpan is like a disintegrated granite and when blasted the good red soil is found under it. When the top soil is cultivated each year the land does not run together again into hardpan, after once being blasted open. I have an orchard on this soil that was blasted twenty-four years ago.

Blasting.

This orchard was for a time the center of much funmaking for the neighborhood. My father returning from his regular summer outing of four or five months was told on the train of the foolish way I was spending money in fireworks out at the ranch. I, fortunately, had all my holes blasted out but twenty-one. The pressure grew too great and I planted the trees in these unblasted places the same as in the blasted holes. Now, after all these years the blasted holes are supporting large vigorous trees, while in the holes not blasted, the trees are not there. I often wonder where I would have been financially if I had not taken my own way in doing things. I have made mistakes by not taking advice, but every success I have had has come against the advice of seemingly competent men. The only thing I have to say, when you see no reason for a thing after thinking it over and over, is to do it in a small way and be patient with the knockers, for, poor things, they have most unhappy minds.

Alfalfa.

The question is often asked me will it pay to blast land for alfalfa. I am watching a man now that has done this and I believe it will pay him. He secured the land cheap in a desirable neighborhood, and the rise in value now the land is becoming productive will pay him. If I had this proposition to meet, the following would be my plan. I would have a good land auger made by having a long handle crossbar at top put on an inch auger. Then I should start out by measuring off a hundred feet each way, making a square. This would give about half an acre. Then bore down every ten feet over the surface. If the hardpan comes within three feet of the surface, bore down through it as far as possible to see the thickness. Where there is three feet of soil I would plant the alfalfa. Where I could go through with a five-foot auger I would use the post hole digger and blast. By doing one-half acre the cost could be actually determined. Then if it was going to prove too expensive, the land could be used for orchard purposes. The cost having been found out in a practical way, the next thing is to estimate on trees. Peaches, plums, pears and like trees are planted from twenty to twenty-five feet apart,

KENDALLS SPAVIN CURE

To Bring Him Back to the "High-Stepping" Class

THE REMEDY USED ALL OVER THE WORLD

For Spavin, Curb, Splint, Ringbone, Abnormal Growths, All Lameness

Kendall's is the main dependence of thousands of horse-owners who have tested its worth for many years and never found it wanting.

GOOD FOR MAN OR BEAST

Ashland Ave., Blue Island, Ill., May 21, 1909.
Dr. B. J. Kendall Co.
Gentlemen: I have been using Kendall's Spavin Cure for over 20 years. I have at all times kept a bottle of Spavin Cure in my barn, and always found it a good medicine to have on hand for man or beast. Yours respectfully,
George Wilson.

Sold by Druggists Everywhere. $1.00 a Bottle; 6 for $5.00. Keep it in the house for family use, as well as in the stable. Get a copy of "A Treatise on the Horse" at your druggists or write to

Is making the very best strains of blood from the island of Jersey a specialty **Whiting Jersey Stock Farm Co. Heber, Cal**

while olives are given thirty to thirty-five. Now put a good charge where every tree is to stand. Get clear below the hardpan down to at least five feet. If after years, if it is noticed the trees are not doing so well, a blast in the open centers between the trees will let the air into the ground. The soil needs air for the roots of plants. Now if these trees after they are older, have their roots under a sheet of hardpan, they are in the same condition as trees that are growing with their roots under the sidewalks of a city.—M. E. Sherman.

MILK INSPECTION.

Of all the foods which people of the larger cities secure, probably that which is liable to contamination to the greatest extent is milk. Unnumbered deaths and cases of sickness have come from carelessness in handling it. The many ways open for its contamination, the nature of the product itself, are all favorable to carrying of disease. This has caused in some cities rigid inspection which has greatly reduced the suffering and the number of deaths, but there is still opportunity for improvement. Scientifically trained men are looking in all directions for improved methods of milk production, handling and transportation. All this has resulted in raising the price of milk, and the consumer is objecting. That is a small factor, however, when he is given purity and wholesomeness.

On the other hand the public demand for pure milk has made opportunity for some conscienceless rascals to work their little games of graft, and for others equally as conscienceless to secure positions which they are in no sense qualified to fill. This has been the occasion of great loss to many dairymen, and other unworthy dairymen have purchased the right to dispose of impure products. In addition to the clean milk problem, the tuberculous cow has given another opportunity for unjust treatment of dairymen, and we are sorry to say, rebellion against the making of proper tests.

Santa Barbara reports an experience which has caused the dairymen about that thriving city to rise in arms against the action of the local "milk commission." A veterinarian, who, it is charged, is not a regularly graduated veterinarian, was appointed chief inspector—but we give the story as told by Dr. J. H. Hester:

"The producers and consumers of milk in this locality are kept pretty well stirred up at the hands of a young M. D. who seems to see a royal road to fame through the agitation of 'sanitary milk supply,' but sad to say he seems to know nothing about how it might be secured. He secured the appointment of city health officers and then secured the passage of a city ordinance making it unlawful to keep a cow or offer any milk for sale in this city without having first secured a permit from the city board of health. This was secured by the promise that it would not cost the owners anything for the examination, but when he began to realize what a task it was going to be to examine all the cows in the city, he rushed into print with a lot of statements as to the conditions prevailing in our dairies, claiming that there was at least one lumpy jawed cow in every dairy and many showing signs of tuberculosis, and brought all the pressure that he could to bear on the city council to have them permit him to employ a non-graduate to test

Merced Colonies

IRRIGATED LAND

Twenty-five hundred acres just added to Merced Colony No. 2

Merced Colony No. 2. Same soil, excellent location, abundant water, good drainage. Merced Colony No. 2 sold to California Farmers, men thoroughly acquainted with the soil and attendant conditions. Twenty sets of buildings already up. New settlers coming in daily. An ideal district for alfalfa, dairying and hog raising. Sweet potatoes, tomatoes, peaches and grapes thrive in the warm loam soil. Terms are easy. Write today for particulars concerning the new tract.

MAN MUST EAT

There is money in

SUGAR and CATTLE

Share in the profits of an agricultural investment, comprising over 21 square miles of rich agricultural lands.

The land has an abundance of water in a district where irrigation, drought and frosts are unknown. Large tame grass pastures have just been prepared.

The land is free from incumbrances, which affords our investors the highest degree of security.

THE PRODUCTS OF THE RANCH ARE CATTLE AND CANE SUGAR, TWO OF THE WORLD'S BIGGEST DIVIDEND PAYERS, AND ON WHICH THE MARKET IS STEADILY ADVANCING.

In this district lean cattle fatten in four months in tame grass pastures and increase 50% to 100% in value.

Cane sugar is manufactured at one-third the cost of beet sugar.

Additional capital is required for improvements and to buy cattle to stock the ranch. A limited amount of investment certificates will be issued in units of $100 cash or on installments. Six per cent per annum interest is guaranteed, and we also share the profits with you. Option given to withdraw your money and profits or to become a part owner of this great property.

Applications for certificates will be filed in the order received. This enterprise is backed by some of the most substantial and well-known business men of Los Angeles. We invite the strictest investigation.

Send for free booklets and descriptive literature.

all the cows, and have the bill sent in to the city. The consumers were getting so worked up over his report of conditions that I came out with a short article and the council refused to permit the employment of the veterinarian, and later ordered him to get busy inspecting and issuing permits, whereupon he resigned as health officer and member of the board of health.

"He next bobs up as milk inspector for the county medical society and comes forward with a list of guaranteed dairies among which are the very dairies which he declared were in such awful condition. I called up five of these dairies and was informed that neither this doctor nor any of the other members of the medical society had been near their dairies since the previous reports, that they did not consider the test necessary, but that they had to do something to quiet their patrons. Four of the proprietors informed me that the doctor in making the test on their herds had taken the first temperature at the time of injecting at about 7 or 8 p. m., and then only once afterwards at about 8 a. m. The other one said he injected and took temperatures at 10 a. m. and then at 8 p. m. and 10 p. m. and was on his road home by 11 p. m. As near as I can find out his charges were 75 cents per head and in some of the cases he had the druggist send in bill for tuberculin used. So you can see it has been a game of extortion all around. I called up the president of the medical society and was informed that this commission was composed of the former health officer, the present health officer and one other member. I also learned that this commission had been appointed since the last meeting of the society, therefore could not have had the sanction of the society."

Mrs. Sherman was asked as to method of tuberculin testing followed, especially regarding number of times temperature was taken, and from her we have:

"The tuberculin test has been worked out to a finish and no one with any amount of reasonableness should try to in any way depart from these rules in actually doing the required work. The actual work and time of taking temperatures as required by the U. S. government I happen to have before me. This test was made by Dr. Otis Longley, deputy state veterinarian:

Yearling Holstein Test.

M. E. Sherman, Fresno, Cal.

"Sept. 14. Temperatures before injections:

12M	3 P.M.	6 P.M.	9 P.M.
102.4	102.6	103.0	102.6

Injected 9 p.m. with 2 C.C. tuberculin.

Temperatures after injection.

6 A.M.	8 A.M.	10 A.M.	12 M.	3 P.M.
102.0	102.0	102.4	102.8	102.6

No local or constitutional reaction.

Otis A. Longley, D.V.S.
Deputy State Veterinarian."

"This certificate was passed on by the New Mexico authorities as well as at Sacramento, so that it is evidently exactly correct in requirements. The animal in question was sold to the U. S. government.

"It is to be deplored when the people are aroused by the fear of using milk furnished by the local dairies. I do not believe that there are many lumpy jawed cows in the dairies, for outside of the fact that the average dairyman is fully as honest and conscientious as the average man anywhere, there is the fact that there is always danger of contagion to well animals. Then, too, one of the first experiences of a dairyman is that only healthy cattle can be relied on to furnish a regular amount of milk each day to meet a regular trade.

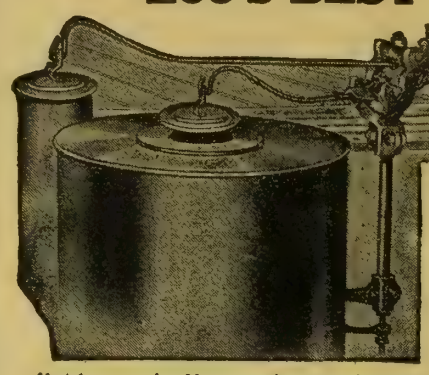
"The dairy pays so well now that a better, or rather a less ignorant, class is handling the cows than ever before in this state. The tuberculosis must go out of the herds to save loss. I often wonder when these 'hues and crys' are raised if it is realized that the tuberculosis of the cow is the bovine type and only a small percentage of the human cases are of this type. This, of course, should not be at all, yet the loss as the matter now stands is on the dairyman largely, for he must bear the expense of the tests.

"I would suggest to the dairymen that they come together, form a class and ask the university to send them an instructor and take up the testing themselves. The actual knowledge gained will enable them to judge of the work of the official testers."

It is criminal for any dairyman to place in the families of consumers any other than the purest of products, and any dairyman who is willing through his carelessness to spread contagion should be dealt with severely. It is also criminal for any so-called commission or inspector to poison people's minds against any worthy and striving dairyman. The state should have a hand in this matter so that both classes could be controlled. This is not referred to as a matter concerning Santa Barbara alone, it concerns the entire state, both consumers and producers.

1912 Incubator Sensation

Lee's BEST Invention



regulates and adjusts, *automatically*, and in correct relation one to the other, *heat, moisture*, and *ventilation*. A great new principle discovered and applied in the

Mandy Lee Incubator

High heat must have low moisture. Low heat must have high moisture. The proportions of each are vital to the hatch. Thousands of hatches are ruined from no other cause than that the *proportions* of heat and moisture are wrong. The Mandy Lee is the only Incubator that applies this principle—the only one that measures the moisture accurately and automatically regulates the amount *according to the temperature*. If the heat from any cause, day or night, rises suddenly, don't worry, the hatch will not be spoiled, because it is *dry heat*. The *moisture* has been *decreased* as *heat increased*, and greater ventilation secured—*all automatically*. This is also the only incubator with *wide-open ventilation*, such as is used in poultry houses, which proved such a great success last year. You should acquire an accurate knowledge of our latest and greatest invention. Our book *shows* and *explains*. Plain, practical, authoritative. Write for free copy.

GEO. H. LEE COMPANY, 225 W. 2nd St., Los Angeles, Cal.

J. H. Hale, the "Peach King," writes: "THE DOUBLE ACTION 'CUTAWAY' is a splendid tool. I use it in polishing off my peach orchards several times a year. A good pair of horses handle it all right."

The genuine "CUTAWAY" tools are used and endorsed by successful orchardists from coast to coast and bay to gulf.

In orchard work the driver can cultivate under the trees and below the low limbs, the horses not interfering with the branches. The double levers give the driver full control of tool at all times. For regular farm work the gangs can be drawn together.

CUTAWAY DOUBLE ACTION ORCHARD HARROW

Every orchardist and fruit grower should have one or more of these labor savers and fruit makers. They will positively pay for themselves in one season. To investigate is to be convinced.

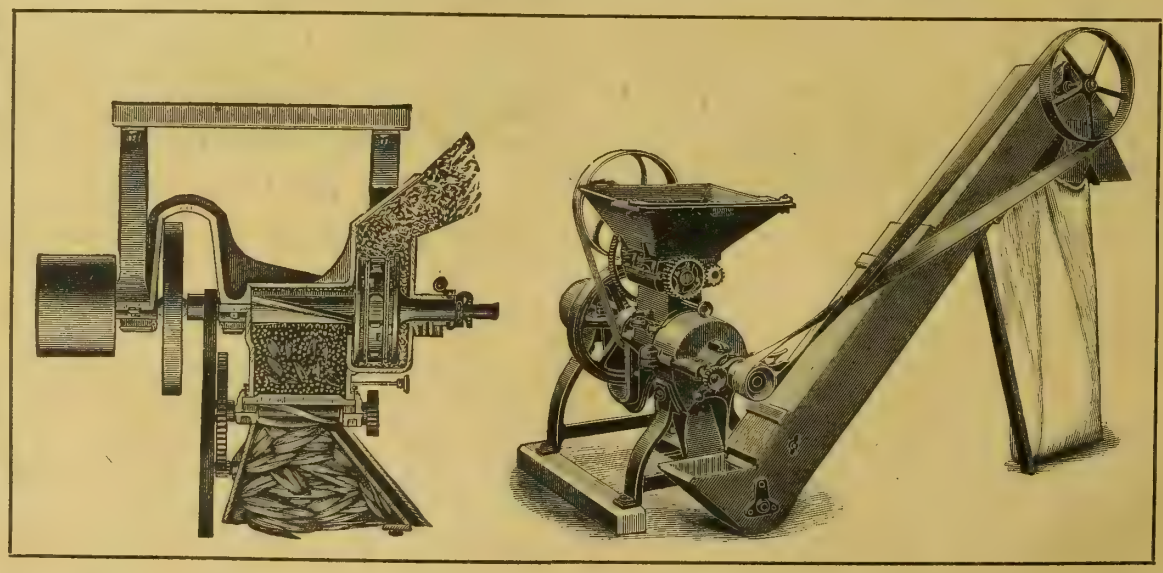
Thorough cultivation makes large crops. Stirring the soil lets in the air, sunshine and new life, and kills foul vegetation. The "CUTAWAY" disk slices, stirs, lifts, twists and aerates the soil. CLARK'S "CUTAWAY" TOOLS run lighter and do better work than any other machine. Lasts a lifetime.

Send today for new catalog, "*Intensive Cultivation.*" Of course, it's free.

CUTAWAY HARROW COMPANY
977 MAIN STREET HIGGANUM, CONNECTICUT

"On the whole, a bushel of corn in the form of corn and cob meal gave 9.56 pounds of increase, and a bushel of corn in the form of corn meal gave 7.04 pounds of increase, a difference in favor of the corn and cob meal of 2.52 pounds of increase per bushel or 35.8 per cent."

Will Grind Dry Alfalfa and Barley Hay, Corn Stalks and Kaffir Corn Stalks



Will Grind Corn, Corn and Husks, and All Kinds of Small Grain

Can you go on in the old way, feeding from 20 to 30 per cent more whole grain than you would need to feed if you ground it, and expect the same results financially?

Can you afford to waste the large stem growth of your alfalfa and barley hay, and the stalks and cobs of corn, and stalks of kaffir corn?.

Can you neglect the opportunity to cheaply prepare a balanced feed for your horses, cattle, hogs, and chickens. recommended by every United States Experimental Station, and expect to succeed?

Does It Pay You Now? If it does not, write for a free illustrated booklet of grinding mills which are moderate in price, and which will do absolutely satisfactory grinding.

Established 1886

Profit in the Poultry Yard

Practical poultry people who may have ideas from their experience as to methods of feeding and housing and general care of poultry will confer a favor upon the Cultivator and its circle of readers by sending in concise accounts. Mrs. Basley is always willing to answer queries, which with the experience of others should make this a most valuable feature in poultry life on the Coast. Opinions or matters of a personal nature should be omitted, but a concise statement of facts is always valuable.

WHAT TO DO WITH CHOICE COCKERELS.

In grading the surplus poultry and dividing it into lots for fattening, farmers having pure-bred flocks will find an occasional cockerel which it seems a pity to send to the slaughtering pen, says a poultryman. The owner instinctively feels that more cash would be realized from the sale of such fellows as breeders than in the form of market poultry, and he is tempted to remove them before the lot enters the fattening pen.

For the man thus perplexed there are ways in which he may utilize such fowls in improving his flock and probably in increasing the season's returns. Intelligent poultry keepers are coming to realize the necessity of introducing new blood into their flocks each season and thus the demand for good, vigorous males is steadily increasing. It is likely, if the number of such fowls is not too large, that places can be found for them in one's own neighborhood at prices considerable above their market value. In thus disposing of them, one is doing his neighbors who keep this breed, a good turn, is, incidentally, helping to build up the breed in that community and is getting rid of the fowls early.

Although better prices would probably be realized by keeping these breeders until the approach of the breeding season, it may not be possible or practical to do this, and anyway, enough cash should be realized from them to pay for the new blood which the owner is probably planning to add to his flock for next season.

Or, if there are other good flocks of his breed in the neighborhood, he may simplify the task of securing new blood by exchanging breeding males with some of his neighbors, provided that their flocks are not already closely related to his. Such exchange may apply not only to this season's cockerels, but to last year's males as well, for there should be some old fowls in this winter's breeding pens, the best plan being to mate the pullets with males of last year, and to have a sufficient number of old hens to mate with the cockerels.

But where it is impossible to dispose of these cockerels in the manner described above there are still several ways open to the man who is determined to get better than market values for them. One of his alternatives is to advertise his stock in some paper which reaches a very large number of that class of poultry owners to which his stock is suited. Another is to shape up a few of his best fowls with a view to showing them at one or two of the local poultry shows within his reach.

This should prove a good move from an advertising standpoint, for, whether his fowls win prizes or not, it brings him into contact with a lot of live poultrymen and gives him a chance to determine for himself as to whether his judgment in selecting cockerels which he considered fit for the breeding pen were good or bad. What he sees and hears at the poultry shows will no doubt largely determine the future of the breeders which he is anxious to dispose of.

If they compare favorably with those reserved by other breeders, a little business judgment should enable him to place them to advantage. If unable to turn them over for cash, the shows afford a favorable opportunity for making exchanges with other breeders, and should he return from the shows without having reduced his flock of breeding males he is really ahead if he has succeeded in exchanging them for new blood in individuals of about equal merit. True, he has not yet converted the choice cockerels into cash, but he is now in position to fit up a good number of breeding pens and produce pure-bred eggs for hatching.

The dangers of inbreeding have been eliminated, and the expense of getting these pens together has not been excessive, so that the eggs should yield a nice profit when sold at prices which farmers are able and willing to pay. A small advertisement in a medium which reaches wide-awake farmers should bring all the orders that can be filled, while honest goods and fair treatment will give this end of the business a start which will render the disposition or utilization of the choice cockerels easier and more remunerative each succeeding year.—Coleman's Rural.

SAVE YOUR INCUBATOR CHICKS

Send us the names of 5 or 10 of your friends who raise poultry and receive FREE our booklet entitled, "White Diarrhoea, the Greatest Foe to Chick Life." This booklet makes Poultry Profits Possible. It treats of only one disease, white diarrhoea—commonly called bowel trouble: gives cause, treatment, and a cure. Write today. It's free, postpaid.

COULSON'S POULTRY FOOD MADE IN PETALUMA

ARE YOU A PART OF CALIFORNIA'S POULTRY SUCCESS?

COULSON'S POULTRY FOOD MADE IN PETALUMA

If not, let us tell you how you may become an important factor in the world of poultrydom.

We grant that you know how to choose good birds. We grant that you have common sense enough to keep your houses clean.

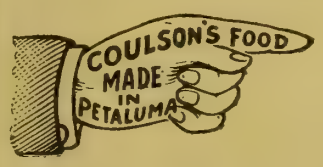
But the feeding problem is often neglected; and it is one of the main factors in poultry success.

Your children grow strong on proper food, and we grant that you try to furnish the best the market affords. You want a well-built house for yourself and family. You know what is the way to avoid doctor's bills.

You give your cattle the best pasturage you can find and you look out for their comfort—because you know it pays to do this.

And when it comes to a consideration of your poultry why not get the best food you can buy? It will pay.

We have made a study of poultry feeding. We have developed a line of foods which produce results that are highly pleasing to poultry raisers.



Poultrymen who use our goods exclusively report that they get results which are astonishing to their neighbors. It is simply a question of—Will you use the best?

Guess work is eliminated—change is avoided—failure is a thing unknown if you use our food.

It is for sale by all reliable poultry supply houses. Insist on getting it. You will get your money's worth and the flock will get its full quota of nutritive value.

COLONY HOUSES FOR POULTRY.

The main requirements of a good poultry house are good ventilation and protection from storms and cold winds. Hens will not lay when weather conditions prevent them from scratching and exercising. Many poultry houses have failed because the variations in night and day temperatures were too great. At many of the experimental stations it has been found that open front houses are more successful than houses with glass windows.

J. Dryden and A. G. Lunn, in a circular of the Oregon Station, state that—

"Ventilation can best be furnished by leaving one end of the house open or covered with burlap or canvas, using no glass windows unless necessary for light. The idea of building a warm house should be abandoned. It is shelter that is needed. The house should be built in such a way that the fowls will not roost near the open front, where they would be exposed to winds; nor should it face the prevailing winds. A long house is more expensive to build, for a given capacity, than one more nearly square. A long, narrow house is also a cold house, having more exposed surface for a given capacity than a square house.

"The size of house necessary for a certain flock will vary in different sections. Where there is little or no snow and where the fowls can be outside every day in the year, two square feet of floor space per fowl will be ample. Where the climate is such that the fowls will seek shelter part of the year, rather than go outdoors on the range, considerably more space should be provided, say four to five square feet per fowl. The idea should be not to crowd them so much that their activity will be interfered with. Whether the shelter is provided by enlarging the house or providing cheap scratching sheds is immaterial. Two square feet per fowl, or even less, is ample for roosting quarters."

W. S. Jacobs, of the Arkansas Station, states that—

"Roosts should be made low or near the ground—not higher than two feet. There are several reasons for this. Fowls of the heavier breeds cannot fly high, and those of the lighter breeds frequently injure the soles of their feet in jumping from high perches. Roosts should be made all the same heights; for if they are made some higher than others the birds will all flock to the highest ones and crowd, which is undesirable.

"When dropping boards are used they should be low down, to permit of easy cleaning. They should be made of matched lumber and be 20 inches wide for one perch and 3 feet wide for two perches, the first perch placed at least 10 inches from the wall. A good roost may be made from material 2 by 2 inches, then slightly rounded on the edges."

According to Dryden and Lunn—

"Poultry keeping is most successful when the colony system prevails. The colony system means the housing of fowls in small houses, preferably portable, where the fowls have free range. The chief advantage is that the fowls are more active or busier than when confined in yards; second, there is less danger from outbreaks of disease, as it is possible to keep the houses on clean ground by moving them occasionally; and, third, the fowls require less feeding and care, as they pick up considerable food on the range. Another advantage of this system is that the fowls will rid the farm of many injurious insects, such as grasshoppers. Then the colony system will fit in with crop rotations, and for part of the year the fowls will live on the stubble fields."

Figure 2 represents a successful colony house with a cloth front, which was used at the Utah Experiment Station. The trap nests in the rear of the building can be opened from the outside. Fig. 4 is an illustration of a Rhode Island closed front house. A good size to build a colony house is 7 by 12, which is large enough to accommodate 30 to 40 fowls, yet is not too heavy to be drawn by a pair of horses when it is desired to move it to a new location. Below are given the details for constructing a colony house (fig. 5) of this size, as recommended by the Oregon Experiment Station.

Construction of the Colony House.

The runners are made of 3-inch by 6-inch by 14-foot rough material and act as side sills for the house. They should be beveled at ends in order to slide easily. The cross sills are 3 inches by 4 inches by 7 feet. They are set 2 inches into the runers and 12 inches from the ends, and fastened with ½-inch bolts. When the siding is put on vertically there is no studding used. The plates are 2 inches by 3 inches by 12 feet, halved at each end. To the plates are nailed the 1-inch by 12-inch by 5-foot boards, and these are battened with 1-inch by 3-inch. The siding is nailed flush with the top of plate and laps 3 inches on runners. The roof is one-third pitch, or 2 feet 4 inches at peak from top line of plates. There are five pairs of rafters, cut with a 1-inch plumb cut at plate. The roof boards are 1-inch by 3-inch material, set 3 inches apart. The roof is shingled and laid 5 inches to the weather. The front is covered with 1-inch mesh wire. The cornice is made of 1-inch by 8-inch boards and projects 5 inches outside of walls. The frieze board, 1 inch by 4 inches, is nailed up tight against the cornice. The door is 2 feet by 6 feet and made from 1-inch by 3-inch material. The nest platform is 2 feet from the ground. It is nailed to a cleat on the side of the house and braced from top of runner. The platform is 22 inches by 5 feet. The nests are made of 5-gallon oil cans, the top and part of front being cut out; 2 inches is left of the front to hold in nest material, and a small strip at top which acts as a brace. Over the nests is fitted a sloping top, which keeps the chickens from standing on nests, and helps to darken the nests. The dropping platform is made of 1-inch by 8-inch ship lap, is 2 feet 6 inches from floor in front and 2 feet 9 inches in rear. The slope permits the board to be cleaned more readily. For the same reason the boards should be put on from front to rear. The perches are made of 2-inch by 3-inch material, set flat. They should also be level and about 12 inches from dropping board in front. The roosts are set 18 inches apart.

Lumber Bill.

Sills (runners), 2 pieces 3 inches by 6 inches by 14 feet, rough.

Cross pieces, 1 piece 3 inches by 4 inches by 14 feet, rough.

One pair 4-inch T hinges.

One lock.

Cost of hardware, $1.60.

Paint.

One gallon creosote, shingle stain.

One gallon paint.

Cost of paint, $2.

Cost of all material at Corvallis, $18.11.

A NEW STYLE OF HOPPER.

One of the late additions to the already rather extensive family of tools and apparatus for the benefit of the poultry raiser is a feeder which has been put into use at Plum Beach Farm, Port Washington, Long Island, where the owner, Mr. Charles P. Hatch, carries on a rather extensive poultry business and has a very excellent and up to date plant. This feeder is designed principally for use in laying houses where it is the common practice to have from six to ten or twelve rooms adjoining each other, the rooms being arranged to hold from 25 to 100 hens, according to size. The floors of these houses are usually covered with litter, and the grain is scattered among it for the purpose of obliging the fowls to take needed exercise in foraging for the grain. These feeders are intended for feeding grain only, but handle any size or kind. It takes considerable time and labor to measure the grain and carry it to the various houses and scatter it, and of course careless employes may overfeed or underfeed or neglect to feed at all.

To replace these conditions and secure accuracy, convenience and speed, a new feeding device is placed in the center of each compartment under the roof. Each feeder has a hopper which holds about two bushels of grain, so that they need only be filled about once a week. Below the hopper is a device to release automatically the grain from the hopper as required, and a device for scattering it about the floor of the room; the grain is evenly scattered in a circle within a diameter of from eight to fifteen feet as may be required. The feeders in the various houses are placed in line with each other and are afterward attached together by a rod extending from one end of the house to the other. This rod extends to the outside of the building at one end, and has a wheel or crank attached to it. By turning this crank a certain number of revolutions, which will take possibly one minute, a certain maximum quantity of grain will be released from each feeder and be distributed automatically. There is a pin on each feeder controlling the outlet, which may be moved in such a manner as to supply any quantity desired less than the maximum, or to shut it off entirely. With this arrangement it will be readily understood that five quarts may be fed in rooms Nos. 1, 3 and 6, three quarts in room No. 2, two quarts in room No. 5, or any other arrangement that is desired; or if any room happens to be vacant, the supply for that room may be cut off entirely and no grain will be wasted.

The use of this feeder, therefore, secures accurate feeding twice a day of, say, one thousand hens in ten adjoining rooms by one man or boy in a total of two minutes time. In addition to this, of course, it is necessary to fill the hoppers once a week, which would probably take one hour for a man. This device is the invention of Baroness Van Haeften Hatch, who takes a great interest in the poultry business. Her progressive and up to date ideas and her personal attention have been very largely the cause of making Plum Beach Farm a most extensive and enterprising poultry producer. This farm, by the way, is one of the most beautiful country places on Long Island Sound, aside from its poultry department.—Country Gentleman.

DISINFECT EGGS.

The following extract from a letter by the well known writer on poultry subjects, Mrs. Bertha M. Rigg, of Hanford, Cal., is of much interest:

"In setting an incubator, I first thoroughly cleanse the machine. I then start the lamp and regulate it to the proper heat for the eggs; then with very warm water I make a ten per cent solution of Zenoleum, and make every part of the egg chamber very wet, not missing a spot. Of course the heat will be again reduced during this process, but I close the machine and allow it to return to the proper mark on the thermometer. I then dilute a ten per cent solution a little. I never have considered it necessary to dilute but a very little for the eggs. This should be quite warm. The eggs are simply immersed and immediately placed on the tray and into the machine. If weather conditions call for moisture at any time during the hatch I add a few drops of Zenoleum to the water when placed in the machine.

"So many people fear to do this with eggs, but I have had the following results: (1) from eggs which otherwise are known not to hatch well, I get more chicks, and (2) they live after they are hatched; (3) the chicks are larger and heavier, with thick down on them; (4) bowel trouble is conspicuous by its absence, making the chicks easier to raise.

"This is why I will have nothing but Zenoleum. I have proved it and know what I can do with it."—Farm Poultry.

The premium list of the Alameda County Poultry Association calling attention to its show on November 21-27, together with entry blanks and full list of premiums, is now being mailed. If the boys put up as handsome a show as they do a catalogue they will be going some. One feature of the book is why do "Oakland Roosters Crow." The question is then answered by calling attention to some of Oakland's boosters' work and the great growth of that thriving city.

Skim milk is a good food for poultry. The fat has been taken from it and leaves it proportionately rich in protein, which is a very desirable element in poultry food. Use it to mix a mash for the chickens. You may also give them all the milk they will drink.

The water dishes should be filled early in the morning. Fowls drink as soon as they leave their roosts and water that has stood over night is never wholesome.

Low Prices on advance orders of deciduous fruit trees. Ballou's Nursery, Pasadena, Cal.

FARM LANDS FOR SALE.

The Best Bargain Yet—A good, well improved, money making farm of 56 acres, 2½ miles from Arroya Grande, Cal. A prosperous little town—no saloons. Five miles from Pizmo Beach, the finest beach in California. Free rural delivery. The house alone cost $2,000. Good barn and outbuildings. Fine roses. Walnuts and oak trees around house. Assorted berries and fruits. Plenty wood for fuel. Plenty of fine soft water. No irrigation required, consequently no danger of Bermuda grass or other foul weeds. Owner must have the money at once, hence the sacrifice. Price $6,500; $3,000 cash, balance two years, 8 per cent. Also an 80-acre tract of fine, level, loamy land, 50 acres of which is No. 1, in northeastern part of Santa Barbara County. Will grow alfalfa, vegetables, fruits, cotton, etc. No alkali or hardpan. Free timber 1½ miles away. Elevation 2,500 feet. No extremes of heat, cold or storms. Can be irrigated if necessary. $600 takes it. Same owner as above. Wm. T. Mantz, Maricopa, Cal.

Citrus Orchard—56 acres, all under cultivation, 670 lemon trees, full bearing; 716 orange trees, full bearing; 200 lemon trees 2 years old, 250 orange trees 2 years old. 60 Tangerines, full bearing; 2 acres deciduous fruit of all kinds, berries and small fruit. Good house of 13 rooms, finished in hardwood, basement. Barn and other buildings, well and windmill. Well for irrigation costing when completed $1500. Palms and flowers. Lighted with acetylene gas. In fact, it is the best ranch in the valley. Over 2000 shares of water stock. Price $37,000. Terms. F. J. Conrad, The Hustler, West Grand Ave., Escondido, Cal.

For Sale—LINDSAY ORANGE LANDS.
Eleven days before Christmas the fourteen packing-houses of Lindsay sent out pay checks for the 1910 navel orange crop. Lindsay orange district had the holiday orange market all to themselves, and of course they sold at good profit.
Why not invest in some of this Lindsay orange land and get the benefit of rapidly advancing prices?
Ten acre tracts in Lindsay, $150 per acre, on easy terms.
Choice Tulare alfalfa lands, water in abundance; any size tracts, $50 per acre up.
KIOUS-WHANN REALTY CO.,
235 Mason Bldg., Los Angeles. A 4164.

For Sale—10 acre orange grove with 5000 boxes of fine fruit on trees. In one of our very best sections, 20 miles from Los Angeles. No frosts, no scale, no smut. Trees 14 years old and in perfect condition. Heavily fertilized last week. Better than 30 per cent annual dividends. Sacrificed by a widowed lady who cannot give it attention; $16,000. Clear $4000 under value. Otto Anderson, 800 West 47th St., Los Angeles, Cal.

For Sale—A 20-acre farm for $20 cash and $20 a month; possession now; $90 to $125 per acre; your crops pay for the land; rich, level land for alfalfa, oranges, almonds, grapes, cows, chickens; abundance of ditch water for irrigation for $1 an acre a year. Where else can you get this? In Oakdale Colony, near good town and railroad station. Climate delightful. T. Wiesendanger, 408 West Sixth Street. **Los Angeles, Cal.**

170 Acres—¼ mile from R.R. station and school. $30 per acre. 100 acres in crop; more can be planted to trees or vines. Partly warm citrus soil or for winter gardening; some alfalfa land; well 50 feet deep, 10 feet across, water 8 feet from surface; all under fence; no other improvements. Terms $3000 cash, balance at 7 per cent; will not trade. Address C. T. Haney, Escondido, Cal.

1920 Acres Alfalfa Land—One of the best subdivision or dairy propositions in the Sacramento Valley. 1,000 acres level bottom loam soil, two cow sheds, 400 head capacity, horse barn for 60 head, 10 room ranch house, blacksmith shop, hog sheds, outbuildings, etc. Well fenced and cross fenced, many corrals. Three miles from railroad station in Butte Co. This is an absolute bargain. Price $50,000. Very easy terms. Apply owner, Paul Goodjoe, 1049 Phelan Building, San Francisco.

For Sale—320 acres, adapted for alfalfa, fruit, vines and vegetables; close to railroad and market, Tulare county; price the cheapest and quality none better in San Joaquin Valley.
Will sell in tracts to suit.

Price $50 per acre.

Address Owner, Box 6, Tipton, Cal.

Choice Orange Land, Exeter District—63 acres, 3 miles south of the town of Exeter, California, three-quarters of a mile from Southern Pacific railroad station, right in the foothills, leveled, water developed on it. Write for particulars. The Phalanx Company, 513 Chamber of Commerce, Los Angeles, Cal.

For Sale—San Diego mountain ranch, 160 acres, $2000 clear; 35 acres cultivated; old house, few bees, fine water, grove, creek, healthy, suitable for stock, alfalfa, fruit or a resort; 20 acres flat valley. Will double in value by 1915. No exchanges. Address E. T. Gray (owner), 605 W. Seventh St., Los Angeles.

Established 1892. 112-118 South Los Angeles Street, Los Angeles.

THE BEST FAMILY READING.

For your home, where the right influence counts for so much, choose the reading that quickens the pulse, that tells of deeds of daring, that takes the reader into strange parts of the world, and yet, with all its power to entertain, depicts honor, true manliness, gentleness, loyalty to principle, as the things of chief importance in life. It benefits while it entertains.

You will find such reading week after week in the pages of The Youth's Companion, contributed by the most popular story-writers, and by men and women whose names are famous in every field of enterprise and scholarship.

Send us your address on a postal card, and we will mail you the beautiful Prospectus of The Companion for 1912, together with sample copies of the paper.

We think you will agree, when you have read them, that there is no other paper that gives quite so much of such a high quality as The Companion, and it costs only $1.75 now for the 52 weekly issues. On January 1, 1912, the subscription price will be advanced to $2.00.

The new subscriber receives a gift of The Companion's Calendar for 1912, in ten colors and gold, and all the remaining issues of 1911 free from the time the subscription is received. THE YOUTH'S COMPANION, 144 Berkeley St., Boston, Mass. New subscriptions received by the Cultivator.

An unintentionally erroneous statement was made in the article headed "A Successful Implement House," on Page 425 of the issue of November 2nd. It referred to the establishment of the company by its founder in 1892. We are now informed that the magazine article from which we took the information was in error. It should have been 1899.

Agriculture

AGRICULTURAL STATISTICS.

Authentic agricultural statistics are worth money and they cost money. The California legislature has made many attempts to get such information and has never succeeded. For years the appropriations to the State Agricultural Society have been made on condition that the society should maintain a department for the collection and publication of agricultural statistics.

And regularly every year the money has been used and nothing which could be called a statistical department has ever been maintained, nor have any original or officially verified statistics of any value whatever been published by the society. Formerly the money was used to promote horse racing. Recently it has been devoted to general expense.

Then the legislature provided for "county statisticians," to be paid, if paid at all, from the county treasuries, and a considerable volume of boom stuff has been collected by these gentlemen, and in due course of time printed by the state. No one desiring accurate knowledge would ever think of referring to the publications of the society, although doubtless they usually contain a good deal that was once true.

At the recent session a law was passed, and has been approved by the governor, ordering the directors of the Agricultural Society to collect and publish the agricultural statistics of the state, the figures for each year to be published by January 31 of the new year, or as nearly thereafter as practicable. Five thousand dollars has been appropriated for the purpose.

Nothing worth while can be done for $5000, which must apparently pay for collection, compilation and printing. There is but one way to collect agricultural statistics of any value, and that is to install a permanent and competent trained statistician, who is also a good executive man, and give him the money to work with. Starting with the figures of the census now being published, the work could probably be kept up in pretty good shape for from $20,000 to $25,000 a year, including cost of printing.

Anything short of that, or any plan which does not mean the appointment of a permanent, non-political, well-trained and experienced statistician at the head of the service means just so much money thrown away.

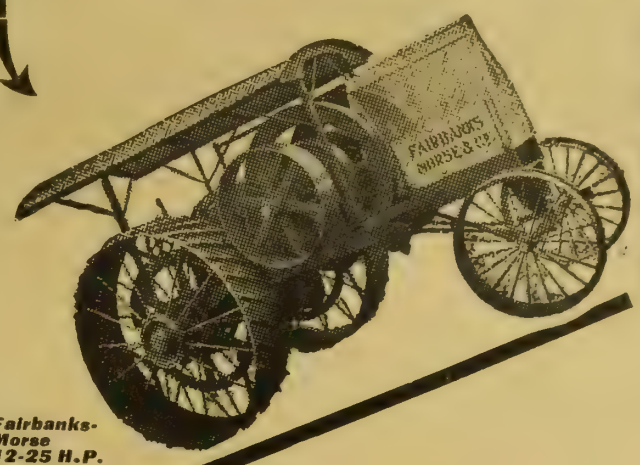
Statistical tables are of little value unless properly grouped and interpreted, with such comment as may be helpful. The value of such statistics depends not merely on the completeness and accuracy of the figures, although that is what costs most money, but on the manner in which they are handled for publication.

The total appropriation by the state in aid of the current expenses of the State Agricultural Society would just about pay for a statistical service.—Mr. Adams in the S. F. Chronicle.

Navy beans will mature in about eleven weeks. Late planting keeps out the weevil and gives ample time to work the crop. Rows should be laid off about 30 to 36 inches apart, and the hills should be about 10 inches apart.

The grape is one of the longest-lived of fruit plants. It will live and bear fruit for over a hundred years.

This Traction Engine Will Pull Loads



Fairbanks-Morse 12-25 H.P. Traction Engine

UP GRADES OF 25 to 27%

A recent customer who bought one of these engines writes us as follows:

"On account of the rolling condition of my land, I had serious doubts of your Traction Engine fulfilling your guarantee, and my anxiety prompted me to make an immediate test. It was my intention to first try it upon pulling a hay baler, which weighs approximately four tons, and the engine was attached to this. With no difficulty the engine pulled the load, without loss of speed, up grades of at least 10 per cent.

"The next trial of importance was to get the Tractor up a hill where grades of 25 to 27 per cent were encountered. It was here that I received my greatest surprise. You know I had a 20 H. P. Fairbanks-Morse Portable Engine, and this required twelve horses to pull it up these same grades. Your Traction Engine went up without any difficulty, which was more than sufficient to satisfy me that your guarantee had been fulfilled. The trial lasted six hours; up hill, down hill, over rocks and boulders—just about as rough a country as could be imagined—it went without trouble or worry."

TRAPPERS GET BUSY
BIG MONEY IN FURS

Over ten million dollars will be paid to trappers of fur bearing animals during the coming winter. Any man or boy living in the country can add a goodly sum to his earnings by trapping during spare moments. We furnish ABSOLUTELY FREE a complete Trapper's Guide which tells you the size of trap and kind of bait to use for the different animals, how to remove the skins and prepare them for market. We also furnish the best traps and baits at lowest prices. We receive more furs direct from trapping grounds than any other house in the world, therefore can pay the highest prices for them. Our price lists, shipping tags, etc., are also FREE for the asking. If you are a trapper or want to become one, write to us today. We will help you.

Fresno raisin packers are embarrassed by shortage of labor.

DYNAMITE IN FARMING.

Dynamite, still the terror of the uninitiated, and supposed by them to be useful only in the frightful havoc of war, or else in big blasting operations under the management of experts, is at last finding its greatest purpose in the humble arts of peace. The American farmer has discovered that, instead of being the awful menace to life and limb, and good for nothing but to wreak useless destruction, it has a most wholesome service in blowing out the stumps and boulders that burden his land, as well as digging his ditches for irrigation, draining swamps and transforming these wastes into the most productive soil in his property, and actually plowing his ground and cultivating his orchards. If there is any other condition on a farm where labor alone seems to be the only means of surmounting it, it is pretty certain that before long some ingenious student of the values of explosives will discover that dynamite will do it far better and more cheaply than under old methods.

Yes, dynamite does all these things, and furthermore it brings under control of the farmer land that he couldn't possibly reclaim otherwise. For instance, the swamp land on the average farm cannot be drained by ordinary methods except at the almost prohibitive cost of constructing elaborate ditches and drainage systems, and even this is not practicable unless there is a natural descent to carry off the water. Even afterward, the land is often so full of brush and trees that there is further great expense before it is finally ready for cultivation.

But along comes the man that knows how, sticks a few innocent looking dynamite cartridges into auger holes below the water, blows the everlasting stuffing out of the hardpan on which the water floats, and, behold! the water sinks out of sight, and the land is ready for clearing. Or else, if this is not sufficient, he plants his cartridges in a row running away from the swamp, touches them off, and he has a ditch that will accommodate a good-sized creek. And in all this the farmer had probably been to less than one-fourth the expense of drainage by ordinary methods and with incalculably less labor. Indeed, such development is not likely to cost more than five dollars an acre, unless there are unusual conditions.

All this makes easily possible the reclamation of the seventy million acres of swamp land in the United States, which has soil of amazing fertility, once it is exposed to the warm influence of the sun.

One Kansas farmer blasted a row of holes across the lower part of a forty-acre swamp on his farm, even where the water was three feet deep, which drained it at once, and the first year he raised forty bushels of oats to the acre, and since then has been harvesting four crops of alfalfa a year.

The same methods are employed in the digging of irrigation ditches; a very costly proceeding with men and teams, but vastly cheaper with dynamite. And the latter has the added advantage of taking care of everything in its path, whether rocks, trees, or hardpan.

One of the hardest problems that have confronted agricultural students in the last few years has been what could be done with the great areas of logged off land, so full of stumps as to make cultivation impossible, and seemingly of no more value than poor grazing ground for sheep.

Dynamite, however, is solving this problem; for it will tear out the stumps and shatter them into firewood, without any other labor than is required to bore a few holes in the wood, and all at one-eighth the cost of man and team labor. This was shown in experiments made by the Long Island railroad, which removed a hundred stumps for sixteen cents apiece, which would have required three men thirty-three days, or an average cost to the stump of over a dollar and thirty cents. The dynamiter and one helper blew out one hundred and fifty stumps in a day.

Even the Douglas fir stumps in the far Northwest, about the toughest of ordinary commercial woods, of over four feet in diameter, have been blasted out at a cost of a dollar and fifteen cents apiece. Instances are shown where land worth twenty dollars an acre was cleared of its stumps for twenty-five dollars and then sold for one hundred dollars an acre.

Indeed, loggers are now using dynamite to a considerable extent in felling timber; particularly in the cypress tracts of the South, where the water prevents choppers from getting at the trees. Other lumbermen say this method is much cheaper in all ordinary cases, and preferable, now that intelligent insertion of the dynamite cartridges into the base of the tree enables them to make it fall in any direction desired. The blast lifts the entire tree a foot or two above ground.

Farmers are also getting rid of huge boulders in their fields by shattering them with dynamite, and then carrying off the pieces. A boulder weighing ten tons can be removed with a single pound of the explosive.

One of the rather curious effects of using dynamite to make the holes for planting fruit trees is that these trees bear far more quickly and prolifically than those put into holes dug with shovels. One fruit grower planted three peach trees in blasted holes and six in the customary manner. Three years later the first three produced six bushels of fine fruit; but the other six were practically dead, owing to the dry weather. The dynamite had loosened the soil for a considerable radius round the hole, which permitted the tender young roots to expand at will into fertile, damp soil far below the surface. Since this has been learned, fruit growers are cultivating their orchards with dynamite, using just sufficient charge to stir the soil about the roots, with valuable results.

And so other farmers are actually plowing with dynamite, planting the sticks over their land near enough together to shatter the soil literally upside down to a depth of five feet or more, pulverizing the hardpan, or compact subsoil, with practically no disturbance of the surface, creating an increased water reservoir, making an easy path for roots to the plant food in the hitherto undisturbed subsoil, thus reclaiming land that had become worn out and practically worthless, so that banner crops followed. One watermelon grower in Georgia, whose crops had become so poor as to be almost unmarketable, read somewhere about exploding the soil, and spent ten dollars for enough dynamite cartridges to turn up an acre. His next crop was the best ever known in his locality.

Fortunate indeed would be the farmer that could reclaim his wornout land, by means of fertilizers and diversified planting, for no greater outlay than ten dollars an acre, and even then he would be leaving the subsoil as dormant as before.

Subsoil blasting increases the fertility of the soil, because the blasts aerate it and open up rich storehouses of natural fertilizer located below the depth to which the plow reaches. A field whose top soil has been worked out will take on new life when the underlying plant food is made available.

And so, it seems, dynamite is blazing the way into a new era of farming.

You Can Feel Safe

when driving home at night if you use a Rayo road lantern.

Its strong, white light reveals the road ahead; the ruby disc in the reflector is a warning in the rear.

It is attached to the vehicle by a simple bracket. Lift it off, and you have a first-class hand lantern.

Rayo lanterns are made in numerous styles, sizes and finishes. They are the strongest and most reliable you can find, and **will not blow or jar out.**

All Rayo lanterns are equipped with selected Rayo globes, clear, red or green, as desired. Wicks inserted in burners, ready to light.

Diarrhoea—Bloat.

A cow had diarrhoea, the discharge containing considerable blood. She was given creolin and improved. About two hours after a feed of bran and alfalfa meal with a handful of oat hay, she was found to be bloated and a neighbor stabbed her with a knife to let out the gas. This seemed to relieve her temporarily, but in a few hours she was swaying from side to side, went into spasms, and 17 hours after being stabbed, died. I opened her and found the last intestine inflamed. Now I have a calf with bloody diarrhoea. Is the disease contagious and what is the remedy?—Subscriber, San Marcos.

Your cow died from inflammation of the internal organs as a result of stabbing the rumen. A trocar should be used instead of a knife. There is a form of diarrhoea in cattle due to contagion, but I am inclined to the opinion that your cattle are getting some acrid plant in the pasture which irritates the bowel. Eliminate the irritant in the food, give a pound of epsom salts dissolved in water as a drench and follow with one tablespoonful of powdered ginger and a level teaspoonful of copperas mixed in ground feed three times a day.—F. G. M.

Cough—Tuberculin Test.

I have a cow which seems in great distress from a cough. She is running down but there is no discharge of any kind. There is a lump under the jaw which, I am told, is caused by barley beards. I blistered the lump, but it does not grow smaller or larger. Could the lump be lanced and whom could I apply to to have this properly done? Is there a test to determine whether she may be tuberculous?—Subscriber, Inglewood.

The cough, loss of flesh and lump under the jaw, combined are symptoms justifying the suspicion of tuberculosis, or other infection. Instead of expectorating, cattle swallow the matter coughed up from the lungs. Employ a veterinarian and let him decide whether to resort to surgery or the tuberculosis test. Get a veterinarian from the city of Los Angeles, if your city has no properly qualified practitioner of veterinary science.—F. G. M.

Shying in Harness.

My horse purchased about five years ago, at the age then of about five years, has the habit of shying at every little thing which happens to be on the roadside, sometimes turning so suddenly as to upset the phaeton. Being an aged woman, 84 years old, and not strong, I am unable to control him when he becomes frightened. We think it is his eyes though they appear to be perfect.—Mrs. A. C. F., Calistoga.

I am of the opinion the horse's eyes are not at fault. The horse is doubtless well fed and not worked sufficiently to overcome his high spirits. Horses disposed to shy a little, at first, and encountering weak restraint may develop the habit of turning abruptly. Considering the age of the horse it is doubtful if the habit can be corrected. However, you could try a more severe bit, subject him to heavy work to overcome his high spirits or employ a driver who is strong enough to manage him at all times.—F. G. M.

Don't pity the busy man. He's happy. The man nursing a soft snap is the one who needs real sympathy—though he may not deserve it.

Queries

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper, and sign full name and address. Unsigned communications receive no attention.

Pheasants.

Where can I secure settings of English Golden or Silver Pheasants eggs; also book on pheasant culture? Is there demand for the pheasants in this state?—Subscriber, Laton.

We are unable to give any information as to where pheasant eggs may be secured. The Department of Agriculture issues in Farmers' Bulletin 390, "Pheasant Rearing in the United States," with chapter on diseases of pheasants. We presume this may be had by writing the Department of Agriculture at Washington. There is also a book on "Pheasants, Their Natural History and Practical Management," by Tegetmeier, which any book dealer can probably secure for you.

Since writing the above we have received from the Fish and Game Commission information that by securing permission from the commission pheasants may be kept, sold and even slaughtered. The statute on the question is:

"Every person who takes, kills, or destroys, or has in his possession, any swan, or any wild pheasants, or any bob-white quail, or any variety of imported quail or partridge, or wild turkey, is guilty of a misdemeanor, provided however, that a person may rear, propagate, and have in possession pheasants and the increase thereof reared in captivity, or pheasants imported from a foreign country, and such artificially propagated or imported pheasants may be killed, sold, or disposed of at any season of the year upon permission from the State Board of Fish and Game Commissioners; and provided, further, that a copy of such permit shall be attached to any pheasants or the package containing the same, in plain view, when the same shall be sold or disposed of as hereinabove provided."

The Commission also writes that it is breeding and distributing Chinese or ring-necked pheasants at the rate of $5.00 per pair and $3.00 for each additional hen. Applications have been made to the commission in excess of the present supply so that one would have to file his application and wait his turn.

Curing Walnuts.

Have just secured a walnut orchard and would like to know how to cure nuts and prepare them for the market. —Subscriber, Sespe.

About the only preparation walnuts require for the market is removal of hulls, sorting out of stick-tights and defective nuts and drying a few days in the trays usually built for this purpose, bleaching in the chloride of lime solution, as given in the Cultivator of Oct. 26, Page 405, and sacking.

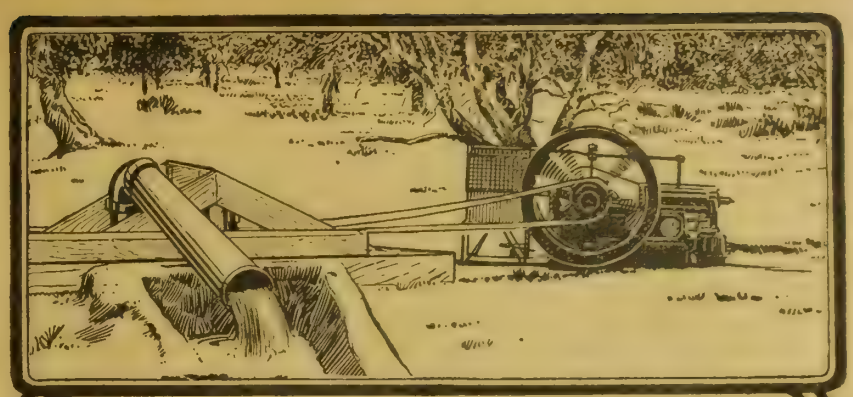
Potash on Prunes.

What is the best time of the year to apply potash to the ground in a young prune orchard? What quantity should be applied?—Subscriber, Campbell.

The best time of the year would be midsummer. Potash is usually considered good for perfecting and sweetening fruit and required for the ripening of wood. Applied at this time of the year there might be danger of its leaching away by winter rains before the roots were in condition to take it up.

Foxtail.

I send specimen of grass. What is



Outfits Like This Made Millions For Farmers Last Year

I H C irrigation outfits mean the difference between a partial crop and a full crop.

Results from the many I H C outfits already installed prove this.

After carefully selecting the seed and tilling the ground thoroughly, why leave the result to chance? Why not know that your crop will receive the right amount of water at the right time?

Now is the time to prepare for a bumper harvest next year. Take the first step by securing one of the famous

I H C Gasoline Engines

It makes you independent of local rainfall by giving you your own water supply system. It pumps all the water you want, just when your crops need it, from streams, lakes, rivers, or wells—economically, steadily, and easily. It is simple, dependable, strong, and durable.

I H C Engines also do all other kinds of farm work, and there is a style and size for every man's needs.

Vertical—2, 3, 25, and 35-H. P.; horizontal—1 to 50-H. P.; semi-portable—1 to 8 H. P.; portable—1 to 25 H. P.; traction—12 to 45-H. P.; sawing, pumping, spraying, and grinding outfits, etc. Built to operate on gas, gasoline, kerosene, distillate, or alcohol—air-cooled or water-cooled. See the I H C local dealer, or, write nearest branch house today for our new special irrigation engine catalogue and all information.

I H C Service Bureau

The Bureau is a clearing house for agricultural data. It aims to learn the best ways of doing things on the farm, and then distribute the information. Your individual experience may help others. Send your problems to the I H C Service Bureau.

MILK STRAIN

Petaluma Cal

it and has it been cultivated?—Subscriber, Turkey, Arizona.

This was referred to a botanist who names it Chaetochloa compositae, a grass found in Texas, Arizona and Mexico. It is sometimes called Foxtail, and is of the same family as the Italian millet. It is native on dry ground, but where irrigated becomes rather luxuriant. It is not likely to become a pest.

Roadside Trees.

At what point along a highway should roadside trees be planted? I have trees growing on the line between ranch and highway. Can they be cut down to work the road?—Subscriber.

So far as the state law is concerned trees may be cut, and surely if in the way of highway improvement there should be no question about it. As to distance from the property line the state law has but little to say. The Los Angeles County engineer has prescribed for that county that for 40 foot streets all trees shall be six feet from the line; for 50 foot streets, eight feet; for 60 foot streets, ten feet; for 70 or 80 foot streets, twelve feet; and for 100 foot streets, fifteen feet. We believe there is one clause in the state law which prescribes that for a road three rods in width trees must be not more than six feet from the line. This is so objectionable that it should be repealed. The same law also stipulates that the trees shall be at least 20 feet apart.

Aliens Owning Land.

Can Japanese or Chinese become landholders or citizens?—Subscriber, Long Beach.

We believe any alien may own land in California. Asiatics are not permited to become citizens, but children of Asiatic parents born in this country become citizens at 21 years of age.

Lizards.

Are lizards harmful or useful, and should we kill them?—Subscriber, Long Beach.

As lizards live upon insect life they are generally considered friends of the planter. We have never heard of their doing any harm and have always supposed they were protected.

Lime on Gravel Loam.

Is water slaked lime beneficial to gravelly loam soil in orange orchard? If so, when should it be applied?—Subscriber, Orange.

We would prefer thoroughly air-slaked lime for applying to all land, but the greatest care must be exercised in applying to gravelly loam. On heavy clay land lime is almost sure to be beneficial, but on a loam, especially in California where soils are usually well supplied with lime, it is generally considered unnecessary, if not unwise. Some believers in abundance of lime neutralizing excess of magnesium in the soil have applied lime liberally, but it must be borne in mind that excess of lime means rapid loss of humus.

Preserving Fence Posts.

Please advise as to preparation for preserving fence posts. Some are green and some dry willow.—Subscriber, Fresno.

Doubtless the best preservative is creosote or carbolineum applied while hot. It will work best on the seasoned posts. Willow treated by this process will last much longer than if put into the ground untreated. The usual method is to heat in a vat deep enough to dip the posts to some two or three inches above where they will be set into the ground. By the "brush treatment" two or three coats of the preservative are applied with ordinary paint brush. With this treatment it has been stated that a penetration of two or three annual rings, ranging from a sixteenth to a quarter of an inch has been secured. Forest Service Circular No. 117 gives extended description of the treatment. When buying creosote get as heavy as can be obtained. If applied very hot the penetration is greater and results better. We presume there is no danger of heating creasote too hot, but we note the above mentioned circular says: "Never heat creosote above 250 degrees. Just above the boiling point of water is considered best." Never brush treated posts when the air or the post is very cold. Have the post as dry as possible before brushing.

TREES

All Varieties True to Name

The only place to trust your order for nursery stock is with an established and conscientious firm. It takes several years to find out what the "fruits of your labor" are to be, hence the great importance of dealing with a reliable concern. Send for our book—

THE GIRL WHO SMILES.

The wind was east and the chimney smoked,
And the old brown house seemed dreary,
For nobody smiled and nobody joked,
The young folks grumbled, the old folks croaked,
They had come home chilled and weary.

They opened the door, and a girl came in:
Oh, she was homely—very;
Her nose was pug, and her cheek was thin,
There wasn't a dimple from brow to chin,
But her smile was bright and cheery.

She spoke not a word of the cold or damp,
Nor yet of the gloom about her,
But she mended the fire and lighted the lamp,
And she put on the place a different stamp
From that it had without her.

They forgot the house was a dull old place,
And smoky from base to rafter,
And the gloom departed from every face
As they felt the charm of her mirthful grace
And the cheer of her happy laughter.

Oh, give em the girl that will smile and sing,
And make all glad together!
To be plain or fair is a lesser thing,
But a kind, unselfish heart can bring
Good cheer in the darkest weather.

—McCall's Magazine.

A PLANNED AFFAIR.

"He's a very nice fellow," I heard my mother say, "and I am sure Esther would make him a good wife."

"I quite agree with you," my father replied.

I gasped and clung to the balcony balustrade, to prevent myself from falling, so surprised was I. They are actually arranging a marriage for me.

Of all the preposterous things I had ever heard, there was nothing to equal this.

Then I resolved to go in and demand to know the name of this "very nice fellow"—ugh! I hated him already. So I stepped into the room.

"I overheard what you were saying about me," I began, "and I don't think it is at all nice——"

"One moment, Esther," my father broke in; "let us have an understanding on the subject. We were going to speak to you this evening about Sir Richard."

Oh! So it was Sir Richard Lancaster. I had never seen him, although I had often heard his praises sung. How I do detest those people whom everyone praises!

"It is Lady Lancaster's wish, and our own, that you and Sir Richard should become engaged," my father resumed. "Of course, if either of you found the other distasteful——" He paused and shrugged his shoulders.

So there was a loophole. Already Sir Richard was distasteful to me.

"Lady Lancaster wants you to go and stay at Lancaster House," began my mother, taking up the attack. "You and Sir Richard will then be able to see each other a great deal."

I returned to my room after having entered into a sort of capitulation. In other words—I am not quite sure of the previous sentence—I agreed to go to Lancaster House for an indefinite period. There was a house party being held there, so I could manage to enjoy myself, at any rate.

The awkward part of it all was that no one knew of Jack Malcolm. We had met at several garden parties, and I liked him awfully. He asked me to marry him last time we met, but I wasn't quite sure and told him to wait. Well, about ten days later I traveled up to London, stayed the night with my aunt, and left King's Cross on the following morning.

Lancaster House is beautifully situated in the heart of a breezy Yorkshire moor, and but for the wretched nightmare of Sir Richard I felt I could have a lovely time.

When I got out at the little country station there was an awfully smart dog-cart drawn up by the platform.

"Are you from Lancaster House?" I asked the man in charge.

"Yes," he replied.

Presently we were bowling along the quiet country road that stretched across the moor. Then we passed through some wooded country, and presently, through a belt of trees, I saw an old grey house.

"Is that Lancaster House?" I asked. "Yes, miss," the driver replied.

"Can I get there by that path?" I queried, pointing to a sweet little path that went zigzagging up towards the house.

"That leads to Lancaster House."

"Then I'll get down and walk," I said.

"I don't think mother would like that," he said.

"Mother!" I cried, in wonder. "Who are you?"

"My name is Lancaster," he replied, somewhat meekly.

"I presume I am speaking to Sir Richard Lancaster?" I said, in very stiff tones.

"At your service," he replied.

"You might have told me who you were," I went on, in high dudgeon.

He laughed lightly and showed two rows of exquisite teeth. I had never noticed how good teeth become a man until then.

"You took me for the coachman," he said, and now I noticed how musical his voice was. "I didn't like to undeceive you at once."

We bowled along in silence for about a mile.

"Here we are, Miss Douglas," suddenly came Sir Richard's voice, and at that moment we passed through some lodge gates and swung up the drive.

Presently Lady Lancaster had welcomed me, and I was seated in a duck of a bedroom, all picked out in pale green, gold and white.

The days quickly slipped by, tennis, boating, driving, croquet, and a host of other enjoyments adding to their speed.

Strangely enough, I had not heard a word concerning the possible engagement, except from Lady Lancaster on the morning after my arrival.

The time slipped by rapidly, and never another word about the—I don't know what to call it. I believe X represents the unknown quantity in algebra, so I'll call the "arrangement" X. I began to wonder whether Sir Richard had forgotten X. It worried me and preyed on my mind. At last I resolved to bring matters to a head and make Sir Richard give me his views.

The opportunity came one evening as we were coming back from a picnic up the river. Sir Richard and I had somehow got a skiff to ourselves.

"Er—Sir Richard," I began, and paused.

"Yes," he replied helpfully.

"You know why—er—why I came here?"

"Oh, yes!" was his reply.

"Well, what do you think of it all?" I asked helplessly, unconsciously repeating the words of a great statesman.

"Rather queer, isn't it?" he asked.

"The fact is," I floundered on, now helplessly out of my depth and not caring a scrap what I said, "the fact is, I have a friend, Mr. Malcolm.

"Not Jack Malcolm?" asked Sir Richard, with suddenly awakened interest.

"Yes, his name is Jack. Do you know him?"

"I knew a Jack Malcolm at Balliol. I wonder if it is the same?"

"Jack was at Balliol," I replied.

"Then it must be the man I know."

"Do your people know anything about it?" Sir Richard asked at length.

"Not a word," I answered dolefully.

He laughed outright.

"Good! We're in the same boat."

"Really?" I cried joyously. "Then what our parents want is——"

I paused for lack of suitable words.

"Your people don't know about this Miss——"

"Trevor," he said. "No, not a word."

"Well, then," I cried excitedly, "why not invite them both here? You could manage it all right."

"I've a great mind to do as you suggest," he remarked, thoughtfully.

Then I exerted all my persuasive powers, and ere we landed I had got Sir Richard to promise to invite Jack Malcolm and Miss Trevor.

Luckily, they were both able to come, and before the week was out they were members of the house party.

I was awfully glad to meet Jack again, but I told him at an early opportunity that I had not made up my mind yet. He laughed and said he could afford to wait.

I was very interested in Miss Trevor, but could not make up my mind whether I liked her or not. She was very pretty and seemed fond of Sir Richard.

Soon the time for my departure drew near, and with it there came a decided disinclination to leave Lancaster House. I had never enjoyed myself so much before. Sir Richard was a charming host and was ever so thoughtful—I had merely to express a wish and it was granted.

Presently, however, I began to notice undry little idiosyncracies in connection with Violet Trevor that made me think she was not good enough for Sir Richard.

She was an awfully nice girl, of course, but Sir Richard was miles too good for her. Then another thing occurred which helped to stir up the tranquillity which I had experienced since the arrival of the two new guests.

What I mean is that Jack began to grow somewhat sulky and reserved. He had not spoken to me about getting married since the first week, and I felt that he was offended.

To tell the truth, I did not want to become engaged to Jack yet.

Then came the climax. Jack said he wanted to speak to me in private. I felt what was coming and nerved myself. I wondered what I was to say—I must try and put him off a little while longer.

"Er—Esther," he began nervously.

"Yes," I replied demurely.

"You know I've often asked you to marry me?"

"On several occasions, you have," was my answer. Now it was coming. I hoped he would not be too passionate.

"Well, your uncertainty has led me to think that we cannot be suited to one another," he went on slowly, "so it will be better not to have any understanding between us."

I gasped. This was a contingency I had never dreamed of.

"The fact is," he continued, "your continual refusals, and particularly the last one, have caused me to think very differently."

"Indeed?" I said calmly.

"Yes, and—er—Miss Trevor is going to marry me," he suddenly blurted out.

"Oh!" The ejaculation forced itself between my lips. Had a bombshell exploded at my feet I could not have been more surprised. At the same time I did not feel any pain, but a strong sympathetic feeling for Sir Richard rose up within me.

Poor Sir Richard what would he do now? But still it was better as it was, for Violet was not good enough for him by a long way, I believe I said that before.

"You'll shake hands, won't you?" Jack said uncertainly.

"Rather!" I cried, and we shook vigorously, our hands, I mean.

"You don't seem to mind very much," he said.

"I expect that will come later," I murmured.

Presently he hurried back to Violet, and I wandered on, feeling so sad about poor Sir Richard. It made my heart quite ache.

"Hallo! Day-dreaming?" suddenly came the voice of the object of my thoughts. A bold idea came into my mind, I would break the news to him myself.

"Sir Richard," I began, in a low voice, "I have a piece of very bad news for you."

"Bad news?" he repeated, gazing at me in surprise.

"Yes, about Miss Trevor."

"Why, what do you mean?"

"Er—Miss Trevor and Mr. Malcolm have——"

"Fixed it up?" he queried.

"That's it," I replied.

"Poor little girl," he said, taking my hand. "I was afraid it was coming. I've noticed it for several days. And you thought about me, whilst you yourself are suffering?"

"Me suffering?" I asked.

"Yes, you and Mr. Malcolm were—" Now it was his turn to pause.

"Oh, I don't mind that in the least," I replied. "I was thinking of you and Miss Trevor."

"Pooh! I didn't care like that, you know; I used to think I did."

"H'm!" I remarked. It was all I could say under the circumstances.

"I say," he went on hurriedly, taking hold of my other hand, "we both seem to have been shunted; can't we —well, you know——"

Somehow or other I did know then, although I had never known before, so I just hung my head, and it rested on his shoulder.—Exchange.

"You wants to be mighty cyahful in dis life," said Uncle Eben, "'bout what you says. You kin git into trouble enough through what people say you said, wifout contributin' nuffin on yoh own account."

VERANDA REFLECTIONS.

How many homes have music in them?

You can trade money for a lot of things.

Corn on the cob is worth two on the toe.

Girls should always make friends of their mothers.

Are you in any way in partnership with your boy?

Did you ever regret any kind word you ever spoke?

Some men ought to have as much backbone as they have wishbone.

Every purchaser plays a safer game when buying of the man who advertises.

Have you got a good title for your farm? If not, the sooner it is clear the less it will cost.

Every town should furnish some sort of rest room for ladies who come from the country.

Do you have as much patience with your postmaster and telephone central as they have with you?

Should town officials furnish, free of charge, water troughs at which farmers can let their horses drink?

How many grandpas and grandmas treat their grandchildren better than their children? Answer: All of 'em.

When the old cow kicks the bucket of milk over, do you say the same thing that you would say if your preacher were present?

The man who didn't go to the election is often the worst kicker.

Should public officers grant to some citizens favors which they refuse to others?—Ohio Department of Agriculture.

SWISS STEAK.

A favorite old-fashioned method of making a tough piece of steak tender was to pound it. As there was bound to be some loss of juices in this process some thrifty person thought of a way to avoid this loss. It was to pound flour into the meat to catch or take up the juices.

The following, called "farmer stew," is a government recipe for steak so prepared: Pound flour into both sides of a round steak, using as much as the meat will take up. This may be done with a meat pounder or with the edge of a heavy plate. Fry in drippings, butter or other fat, in a Scotch bowl, or if more convenient in an ordinary iron kettle or a frying pan; then add water enough to cover it. Cover the dish tightly so that the steam cannot escape and allow the meat to simmer for two hours or until it is tender. One advantage of this is that the steam cannot escape until the meat is done, as the gravy is already thickened. However, if a large amount of fat is used in the frying, the gravy may not be thick enough and must be blended with flour.—Ex.

IF YOU HAVE NO ICE.

The July Woman's Home Companion contains a great variety of practical housekeeping suggestions. Here is one for the housekeeper who gets along without ice:

"Obtain a large, common flower-pot and seal the hole in the bottom with plaster of Paris. Place in the pot the bottle containing milk, or a covered crock containing butter, and fill the pot with water to as great a depth as possible without the bottle or crock floating. Cover the pot with a board or a plate and set out in the open air, away from the direct sunlight, and preferably where there is a current of air. The exaporation of the water from the surface of the porous pot will keep the contents several degrees colder than the outside air, when there is the slightest amount of air stirring. The higher the wind, or the drier the air, the greater will be the cooling effect."

THE BEST OFFER WE HAVE EVER MADE

We have furnished in the last few weeks over 1200 of these

LATEST CENSUS CHARTS

FREE

To the Man Who Owns a Horse, a Cow, a Sheep, or Hog;

To the Woman who Owns Poultry:

Willsden's Anatomical Chart will be found more valuable than any single book or publication that can be secured anywhere, at any price.

It includes five distinct plates in colors of the horse, first showing exterior parts; second, the bones; third, the veins or circulatory system; fourth, the muscles, and fifth, the internal organs. Each part, bone, vein, muscle and organ is plainly designated by name.

There are also five similar plates each for the COW, SHEEP, HOG, and CHICKEN, all carefully drawn and engraved, and in correct coloring. In connection with these plates are carefully written articles by eminent stockmen and veterinarians, describing the chart in detail. For instance, the write-up on cattle gives an explanation of each of the five plates, then gives some valuable suggestions regarding general care and management, shelter, and feed, as well as describing their common ailments with symptoms and treatment. While this chart may not displace the veterinary surgeon, a thorough understanding of the information it contains will save thousands of dollars' worth of livestock and poultry each year which have been lost heretofore BECAUSE THE OWNER DID NOT KNOW AND HAD NO WAY OF FINDING OUT JUST WHAT TO DO AT THE RIGHT TIME.

The HON. F. D. COBURN, who is considered authority, in his book "Swine in America," gives several secret remedies. The LIVESTOCK ANATOMICAL CHART GIVES THESE SAME REMEDIES, AND THAT ON HOG CHOLERA CURE IS ALONE WORTH HUNDREDS OF DOLLARS TO ANYONE WHO RAISES HOGS.

The publisher of the SHEPHERD JOURNAL gives in this chart many valuable treatments of diseases of the sheep.

DR. J. W. THOMPSON, editor of THE SPIRIT OF THE WEST, gives a world of information on care and treatment of diseases of the horse.

REESE V. HICKS, editor of POULTRY CULTURE, takes up the subject of poultry, and also gives the best known method of preserving eggs; it is simple—yet has been recommended by the Governments of the United States, Great Britain and Germany.

This Chart Also Contains

Latest map of California and Nevada.
Map of the United States.
Map of the World.
Complete list of California cities and towns with 1910 census.
Portraits of all California governors, from first to last.
Pictures, maps and data concerning Panama Canal.
Flags of all nations.
Portraits of the world's rulers, etc.

Read what a few of the Best-Informed Stock and Agricultural Authorities of the Country have to say:

Frederick W. Meyst, Washington, D. C., says:
During all my studies and experience I have never come across a chart so complete in every detail as the Willsden' Livestock Anatomical Chart. Every farmer and live-stock raiser should have one.

C. H. Stange, Iowa State College, Ames, Ia., says:
In my estimation the Livestock Anatomical Chart should be used in office or home of every livestock raiser.

John M. True, Secretary Board of Agriculture, Madison, Wis., says:
The Livestock Anatomical Chart contains much useful information for the stockman and farmer, and is arranged in a manner both available and practical.

Dr. O. O. Wolf, President Kansas Med. Vet. Assn., says:
Through the Livestock Anatomical Chart the practical knowledge in the care and treatment of livestock may be had through which thousands of dollars may be saved by livestock raisers and farmers everywhere.

How to Secure This Unrivaled Chart Free

The regular price of the RURAL CALIFORNIAN has always been and is now $1.00 per year. Hay.

Arrivals of hay on the San Francisco market for the week past have amounted to 3,150 tons. The bulk of this amount consisted of alfalfa. The market has been well sustained under the conditions that have prevailed here during the month of October, as that month is always a very dull month in the trade in San Francisco. Many of the large consumers put in somewhat of hay during the harvest and while the hay was coming out of the fields, and for that reason are not in the market to purchase during the month.

While the demand has been quiet, an undercurrent of strength is plainly evident, and as soon as there is a little better inquiry for hay it is the general opinion that a better condition of affairs may be expected at once. The export trade on hay has been decidedly moderate during the last week, although there is a little being shipped along the Coast right along, but the quantity has not been large enough to affect the market in any way.

Immense quantities of alfalfa hay have been brought in. The month has been most favorable for the alfalfa farmers along the rivers to harvest their late cuttings. Much of this hay has been baled and shipped in rapidly, and there is considerable more to come forward, providing the weather holds good. The demand for straw is not active, and the market on this article is a little quiet, in sympathy with the condition on hay.

At present much interest centers around the reports from the sections tributary to the San Francisco market on stocks of hay on hand Novem-

Deciduous Fruit Market

F. B. McKevitt, general manager of the California Fruit Distributors, reports:

Sacramento, Cal., Nov. 4, 1911.

The following gives number of cars of deciduous fruit shipped from all points of California for the week (7 days) ending Friday morning, Nov. 3, 1911:

Pears—5¼ cars. Limited shipments of the fall and winter varieties are still going forward and will not be completed for another week or ten days, but the volume will necessarily be very small.

Grapes—474½ cars. Shipment this week shows a falling off of nearly one hundred cars from the previous week. There will undoubtedly be an even greater decline during the next seven days. The Tokay movement is nearing its conclusion, but there will be full cars of this variety available in a somewhat limited way during the coming week. The principal volume of shipments will be Emperor and the last of the Cornichons. There is a liberal movement of the former variety from the Fresno district at the present time and the fruit is of the usual good quality to be expected from that section.

Comparative Statement of Shipments,

Nov 4	1910	1911
Cherries	250½	216¼
Apricots	289¾	214½
Peaches	2,517¾	2,027
Plums	1,552½	1,366
Pears	2,360	2,303
Grapes	4,492½	5,260½
Sundry	16	16
Total	11,479	11,405½

Citrus Fruit Market

LOS ANGELES, Nov. 8, 1911.

The few Valencias as yet on the road are being received favorably by the Eastern market, and the new crop Navels which are going, so far as can be determined this early, will command excellent returns. Only very few cars have been sold, and these at exceptionally long prices, but as shipments of the earlier fruit increase these prices will probably be reduced. Florida and island fruit is also being well received, and all is rather sweeter than ever heretofore. California's total shipments since November 1 are rather greater than last year, but a part of this is in Valencias which had not been cleaned up.

Lemons are still shading slightly, and prices are not quite as high as last year this date, but still satisfactory to growers. The most satisfactory feature, however, is the keen demand for Californias in preference to foreigns. Foreigns are not being received with the freedom of last year.

Shipments.

Total shipments since November 1: Oranges, 40 cars; lemons, 80 cars; total citrus fruits, 120 cars. To same date last season: Oranges, 27 cars; lemons, 67; total, 94.

The one day's shipments made after last week's report raise the total for the year 1910-1911 to oranges 36,821 cars, lemons 6,764; total of citrus fruits from Southern California, 43,585. Tulare's shipments remain same as given, 2,193 oranges, 105 lemons. Butte, 489 cars oranges. Grand total of all citrus fruits from the state, 46,372 cars. With local consumption not counted in the above, there is no question that the output will be in excess of the 50,000 carloads which was the preliminary estimate of a year ago.

BOSTON, Nov. 7.—Two cars sold. Clear and warm. Market is unchanged.

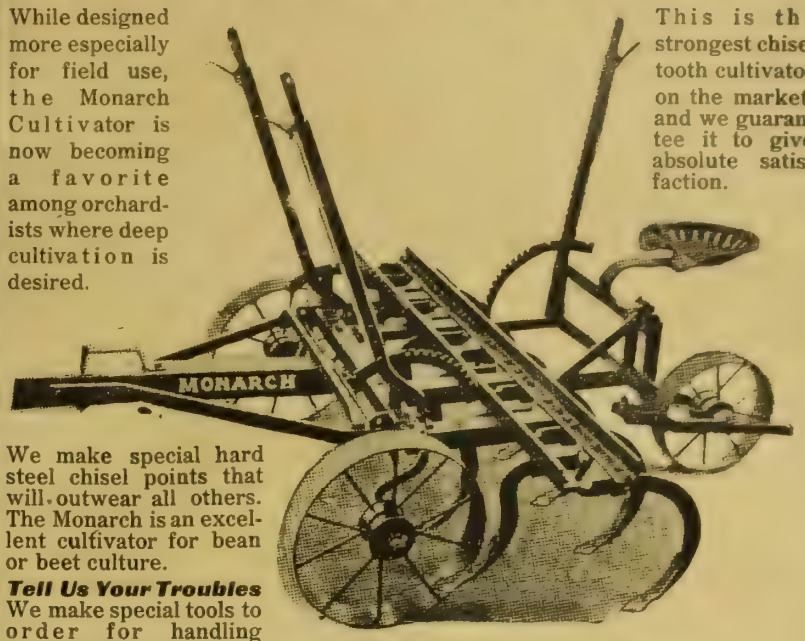
Monarch Cultivator

While designed more especially for field use, the Monarch Cultivator is now becoming a favorite among orchardists where deep cultivation is desired.



This is the strongest chisel tooth cultivator on the market, and we guarantee it to give absolute satisfaction.

We make special hard steel chisel points that will outwear all others. The Monarch is an excellent cultivator for bean or beet culture.

Bean Power Sprayers

ELIMINATE COSTLY REPAIRS

All parts are made with jigs and templates—and do not vary one-thousandth of an inch. When any part becomes worn it can be replaced with another at small cost. And the parts are so readily accessible that any orchardist can do the work himself.

Our catalog illustrates and describes all Bean parts and if they cannot be procured from your local dealer, they can always be ordered direct from the factory. This is a feature that you ought not to overlook.

But interchangeability of parts is not the only reason for investigating the Bean line. There are innumerable features that commend themselves to every orchardist who takes the time to look into them.

The BEAN PRESSURE REGULATOR, a new feature this season, saves from one-fourth to one-third of the gasoline and the same proportion of wear and tear on engine and pump. Another economy that means not only less cost of operation but longer life for the outfit.

SEND FOR A COPY OF OUR NEW CATALOG. IT OUGHT TO BE IN THE HANDS OF EVERY PERSON INTERESTED IN THE PURCHASE OF A SPRAYING OUTFIT.

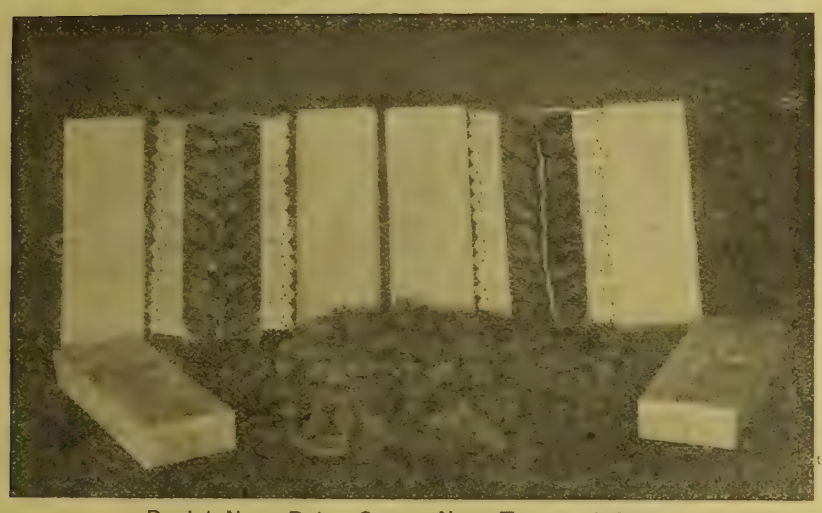
The Ripening of Dates by Artificial Methods

Illustrations from a Valuable Bulletin Just Issued by the Arizona Experiment Station. Artificial Ripening Gives Many Advantages and Permits of Long Shipments of the Fresh Fruits



Deglet Noor Dates Grown Near Tempe, Arizona.

More Arizona Dates.

It is possible that date culture will prove as profitable as its most enthusiastic friends today believe it will, but a few of the more cautious are calling a word of warning. We are told that suckers from the more desirable plants are now commanding as high as $7.00 each in the Coachella and Imperial Valleys. Arizona is also interested, and it is evident from the magnificent fruit obtained in Arizona and desert regions in California that as to quality of fruit the Southwest will beat the world. Some of it is sold as high as $1.00 per pound, and those who have been so fortunate as to test it say that it tastes like more. The extension of our productive industries means prosperity, and we trust many acres will be planted, but we also trust that the planters will not put out their land with the expectation of dollar a pound prices.

Arizona is taking an advanced position in this industry, and aided by government experiment stations, is showing remarkable results. The territorial experiment station has issued information along this line, the latest one being Bulletin No. 66 on "Chemistry and Ripening of the Date by Incubation." It is by A. E. Vinson and G. F. Ferguson, and is a report of scientific studies relating to composition and ripening of dates and the economic results in ripening and marketing.

The Date Harvest at Tozeur, Tunis, Showing Wasteful and Slovenly Methods Which American Practice Will Correct.

The fruit upon the tree ripens very unevenly. By cutting the entire bunch from the palm before fruit begins to ripen and drop and before attacks by insects, molds and bacteria begin, better control and much finer fruit is secured. Besides there is less danger of loss from rains and worms than where it ripens naturally, and some of the later varieties like the Deglet Noor, which have not done well because of ripening during the cooler weather, are successfully brought through. It is thought that by this process early varieties may now be grown at greater altitudes and in addition dates may be gathered while still hard and shipped long distances, ripened artificially, and marketed fresh and in the best of condition. From Director Forbes' preface we quote:

"Eleven years ago, when attention to this subject was renewed, it was supposed that the imported date palms at Tempe would soon develop large and remunerative crops. But it soon became evident hat there were some cultural difficulties and various enemies to be overcome, before this desirable condition could be realized. Among the causes of delay to a successful outcome were the ground squirrels and the rats which injure or destroy the trees; the Old World scale insects which multiply

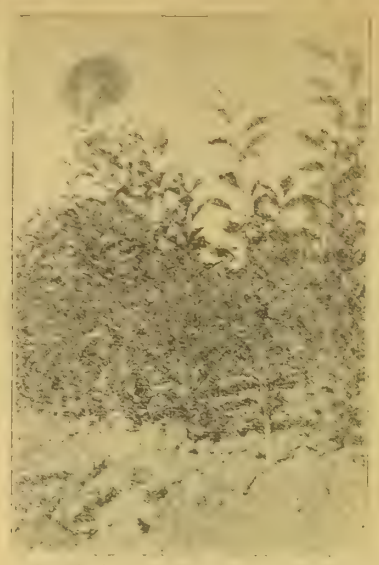
Ripening Dates in Lower California.

Transportation to Market in Lower Ca lifornia.



Citrus Trees

First quality trees will be scarce in 1912

The man who plants an orange or lemon grove is planting for a lifetime. Poor trees cannot be considered at any price if he wants good results. A few cents per tree saved at time of purchase often costs dollars per tree in after years.

Why not buy the best? The quality is there and remains long after the price is forgotten. We offer a limited quantity of strictly first-class, healthy trees, one year old buds, for 1912:

6500 Eureka Lemons
2000 Villa Franca Lemons
9000 Washington Navels
750 Valencias
500 Marsh Seedles Grape Fruit

Budded on sour stock roots, grown in loose soil, clean, vigorous trees, guaranteed true to name. These trees have been carefully grown, are straight, and extra care was taken in selecting buds from the best fruiting trees, the parent stock which is of proven prolific habit—thus insuring good bearing trees.

Longer life through seed and bud selection. The above cut shows what these trees were at the time of budding, October, 1910, measuring four to five feet high. The trees now show for themselves. A large portion of them measure from five-eighths of an inch to three-quarters of an inch and have been pronounced by experts to be the finest bunch of one year trees they have ever seen.

We invite inspection and comparison, and solicit correspondence. We will sell these trees at current prices. We will refund traveling expenses to any out of town purchasers. Twenty years experience in expert citrus horticultural work.

Dewey-Greenleaf Citrus Nursery

Telephone Chas. Dewey, residence phone "Sunset 113 R." | Twenty-sixth and Mountain Ave., Upland, San Bernardino County, Cal.

N. B.—These trees will pass inspection—no scrubbing.

BUY CITRUS TREES

Buy your Citrus trees of the **LARGEST AND BEST EQUIPPED NURSERY IN THE WORLD.** Now is the best time to place your order for spring planting. Be sure to get your order in while first-class stock is available.

Our trees are all budded from 3 to 7 inches above the surface of the ground, which will eliminate any possibility of planting the bud union below the surface of the ground. This particular point should receive due consideration.

Our booklet entitled "Citrus Fruits" mailed to any address on receipt of 25 cents; credit given for this amount on first order.

Write us today for prices and information. All correspondence most cheerfully answered.

Citrus and Tropical Fruits

LEMON FREIGHT RATE.

Commenting on the departure of G. Harold Powell, secretary of the Citrus League, Attorney Call and a number of citrus fruit growers for Washington to attend the lemon rate hearing, the Riverside Press reviews the history of the lemon rate case as follows:

Recent adverse decisions given by the United States commerce court resulted in speedy reopening and rehearing of the lemon railroad rate before the Interstate Commerce Commission, which will be in session in Washington on November 15. The California delegation will arrive in Washington next Monday and will be fully prepared with data and argument for the restoration of the $1 rate.

Representatives of the California lemon industry do not anticipate that there will be a demand on the part of the commission for additional evidence or extended argument, as all of the vital points were covered at the first investigation; but if any additional facts are required they will be promptly presented by Judge Call through Secretary Powell and the fruit growers in attendance at the hearing.

The transcontinental railroads will be represented by officials and counsel.

History of Lemon Rate.

From 1895 to November 30, 1902, the rate on lemons was $1.25 per hundred weight for the middle west and Atlantic seaboard; December 1, 1902, to May 31, 1903, winter relief rate, $1 per hundred weight; June 1, 1903, to November 30, 1903, $1.25; December 1, 1903, to June 15, 1904, $1; June 16, 1904, to October 31, 1904, $1.25.

November 1, 1905, to December 5, 1909, the rate was made permanent voluntarily by the railroads, $1. After the passage of the Payne-Aldrich act, which increased the duty on lemons from 1 cent to 1½ cents per pound, the railroads raised the rate to $1.15 per hundred weight, the tariffs becoming effective December 5, 1909. The growers obtained an injunction in the circuit court of the United States for Southern California, restraining the railroads from putting into effect the $1.15 rate until the reasonableness of it could be passed upon by the commission. The interstate Commerce Commission, 1910, decided the rate of $1.15 to be unreasonable, that the rate should not exceed $1.

Through the circuit court of the United States for district of Kansas the railroads secured an interlocutory injunction suspending the order of the commission and referring the case to the United States commerce court. The commerce court October 5, 1911, issued a permanent injunction restraining the enforcement of the order of the commission, which had the effect of restoring the rate of $1.15 and referred the case back to the commission for a reconsideration.

Commerce Court Decisions.

In deciding the lemon rate case the United States commerce court took the ground that the interstate commerce commission, in fixing the rate of $1, dealt with matters which tended to show the need of the California industry of a high protective tariff against Italy and did not fix it upon tariff considerations. The court in its decision said:

"As in our judgment the order is based primarily on the assumed authority to protect the industry against foreign competition, it must be held void as beyond the powers delegated to the commission. This conclusion renders it unnecessary to determine whether, under evidence, the rate of $1 is confiscatory, or whether the commission is empowered to prescribe blanket rates either generally or subject to the limitation that the rate between the most distant points must be at least non-confiscatory.

"A permanent injunction will be granted, restraining the enforcement of the order as to the rate on lemons, without prejudice to a reopening and reconsideration by the commission of the original proceedings before it or of any further complaint in respect to the $1.15 rate, now disposed of."

Value of Industry.

It is estimated that there are 25,000 acres in California planted to lemons, the citrus fruit industry alone representing an investment of $175,000,000. The annual cash returns for the crop is around $30,000,000.

While 25,000 acres are in lemons, it is known from careful investigation that there still remain 75,000 to 100,000 acres which are adapted to lemon growing at a profit.

Help from Washington.

While in Washington Secretary Powell will urge upon the department of agriculture the necessity of sending a number of specialists to California to make a study of some troubles which affect some of the citrus groves and which are not now well understood. He will also lay before the department the commercial practices of the California industry in the shipment of early oranges from the state, so that the department will have a full understanding of the question of handling the green fruit decision, which was made through the pure food board and which holds that green, immature oranges which have been artificially colored by holding in a warm, moist atmosphere have been treated so as to conceal inferiority, and are therefore subject to the pure food act when they enter into interstate commerce.

OLIVE PICKLING.

So many calls are made for a repetition of Mrs. Sherman's olive pickling formula which was given last year, that we repeat it. It's worth a year's subscription to the Cultivator. Keep it.

* * *

There seems to be no way of absolutely testing the olive to find out exactly the amount of bitterness that must be removed each season. It certainly is true that some seasons the olives are made into pickles with much less trouble. After having pickled them for many seasons, I have found the following method the best. I was first given an insight into this matter by a charming Spanish gentleman, a former governor of California, years ago in Los Angeles. Then ashes from the oak trees were used to furnish the potash to remove the bitterness. As made by these people the olive was delicious. Their success was made by careful attention to little details.

Free Stones.

When the olive pit will slip reason-

ably clear from the meat, it is time to begin to get the barrels or tubs or troughs ready. Everything must be cleaned, scalded, and then finally treated to a dose of lime water to be sure of the containers imparting no foreign taste. The olives are gathered in picking sacks or in tin pails, using care not to bruise them. If there are many to handle it will pay to use a grader for them; if only a few they may be readily graded by hand, separating the larger ones from the smaller ones. Then again if there are many that are not colored, it is better to keep these separate as they do not cut in the same time as more highly colored fruit. A little care in picking to take only the dark fruit saves this color grading.

Lye.

The lye used for cutting the bitter white juices out of the olive must be of good quality and at least 90 per cent pure. The Greenbanks or the Hercules brand come in ten-pound cans and have given us good success. These tins may hold more than is needed, but this strong lye is very useful around the house. It can be used to flush out drains and to mop up floors that are stained.

The ordinary five gallon coal oil cans are cut into buckets with handles and are convenient as measures. The lye solution is made weak, about one and one-half to two per cent solution. The work is done by leaving the lye on twelve to forty-eight hours and once in a great while comes a season when it is necessary to use a second weak solution of lye. That has happened only once to me in many years, I think because the olives were almost at frost point and as the weather was very cold the lye did not act freely. Strong solutions that will penetrate in a few hours act on the tissues of the olive meats and cause them to soften and spoil.

Weigh one and a half to two pounds of lye and add it to one hundred pounds of water. Eight pounds of water is approximately one gallon. A coal oil can holds five gallons or forty pounds of water. Two and a half cans of water added to one and one-half pounds of the lye makes a solution of one and one-half per cent. Then use your two hands as a scoop and add as much common salt as the hands will hold. Mix the salt and lye in the water and when well dissolved pour over the olives. Use enough solution to have it three to four inches deep over the top of the berries. If the olives float, use a piece of clean cheese cloth and then a wooden follower to hold them under. This is usually not necessary, however, as the olives are heavier, if of any size, than this solution. Cover the barrel from the light to save coloring as much as possible. The salt will keep the olives firm while in the lye and also, by its use they are partly salted before they are finished. The slimy bacteria are the only ones that interfere in making olive pickles and these can be controlled by a little salt.

Take from Solution.

Now comes the critical part of the work, training the eye to know when the cutting has proceeded far enough. I usually put the lye on at noontime and at night draw off a pail full or two and pour it again over the top of the olives to keep the lye from settling to the bottom too much. The next morning take a few olives from the barrels that represent an average of the sizes and ripeness. Cut them open with a knife to the pit and see the line of penetration of the lye. The lye carries a distinct yellow stain with it, while the juices of the olive are milky and the meat whiter when untouched by the lye. The lye must penetrate to within a line's breadth of the pit but not absolutely to it. When this line is reached turn off the lye at once. Perhaps once in ten or twelve years there may come a year when a second weak solution needs to be used. I have overcome this difficulty by warming up a tin of the lye solution and in that way secured better penetration. As long as the lye water is soapy or sleek feeling, there is strength in it. Sometimes the olives are as long as 26 to 48 hours in the solution. When the time comes that the olives are almost cut enough,

Deciduous Fruit Culture

PICKING AND MARKETING APPLES.

An apple usually should be fully grown and highly colored when picked, to give it the best keeping and commercial qualities. When harvested in that condition it is less liable to scald, of better quality, more attractive in appearance, and is worth more money than when it is picked in greener condition.

An exception to the statement appears to exist in the case of certain varieties when borne on rapidly growing young trees. Such fruit is likely to be overgrown, and under these conditions the apples may need picking before they reach their highest color and full development.

Uniform color may be secured by pruning to let the sunlight into the tree, by cultural conditions that check the growth of the tree early in the fall, and by picking over the trees several times, taking the apples in each picking that have attained the desired degree of color and size.

Apples should be stored as quickly as possible after picking. The fruit ripens rapidly after it is picked, especially if the weather is hot. The ripening which takes place between the time of picking and storage shortens the life of the fruit in the storage house. The fruit rots multiply rapidly if storage is delayed and the fruit becomes heated. If the weather is cool enough to prevent after ripening, a delay in the storage of the fruit may not be injurious to its keeping quality.

A temperature of 31 to 32 degrees F. retards the ripening processes more than a higher temperature. This temperature favors the fruit in other respects.

A fruit wrapper retards the ripening of the fruit; it preserves its bright color, checks transpiration and lessens wilting, protects the apple from bruising, and prevents the spread of fungous spores from decayed to perfect fruit. In commercial practice the use of the wrapper may be advisable on the finest grades of fruit that are placed on the market in small packages.

Apples that are to be stored for any length of time should be placed in closed packages. Fruit in ventilated packages is likely to be injured by wilting. Delicate fruit and fruit on which the ripening processes need to be quickly checked should be stored in the smallest practicable package. The fruit cools more rapidly in small packages.

Apples should be in a firm condition when taken from storage, and kept in a low temperature after removal. A high temperature hastens decomposition and develops scald.

The best fruit keeps best in storage. When the crop is light it may pay to store fruit of inferior grade, but in this case the grades should be established when the fruit is picked. The bruising of the fruit leads to premature decay.

The scald is probably caused by a ferment or enzyme which works most rapidly in a high temperature. Fruit picked before it is mature is more susceptible than highly colored, well developed fruit.

After the fruit is picked its susceptibility to scald increases as the ripening progresses.

The ripening that takes place between the picking of the fruit and its storage makes it more susceptible to scald, and delay in storing the fruit in hot weather is particularly injurious.

The fruit scalds least in a low temperature. On removal from storage late in the season the scald develops quickly, especially when the temperature is high.

It does not appear practicable to treat the fruit with gases or other substances to prevent the scald.

From the practical standpoint the scald may be prevented to the greatest extent by producing highly colored, well developed fruit, by storing it as soon as it is picked in a temperature of 31 to 32 degrees F., by removing it from storage while it is still free from scald, and by holding it after removal in the coolest possible temperature.

A variety may differ in its keeping quality when grown in different parts of the country. It may vary when grown in the same locality under different cultural conditions. The character of the soil, the age of the trees, the care of the orchard—all of these factors modify the growth of the tree and fruit and may affect the keeping quality of the apples. The character of the season also modifies the keeping power of the fruit.

WALNUT BLEACH.

Referring to our recent answer to inquiries as to walnut bleach, Mr. Arthur Staley, secretary of Fullerton-Placentia Walnut Association, writes:

"We use twenty-four pounds chloride of lime and six pounds monohydrate crystals of soda to 50 gallons of water; the monohydrate dissolves in cold water while salsoda has to be boiled. There is no patent on this solution; it is an old preparation known under the name of Javelle water. The Farrell patent, now owned by the Anderson-Barngrover Mfg. Co. of San Jose, is based entirely upon the addition of an acid to the solution coincident with the immersion of the nuts; this hastens the action of the bleach and makes it a success commercially and on a large scale; the same effect is produced by giving the bleach a longer time to act, or by sulphuring very lightly after dipping while the nuts are still wet with the solution.

VALUABLE PEACH.

Mr. George M. Young of Placentia recently brought to this office a couple of magnifient late freestone peaches. The tree is a sprout presumably from stump of an old seedling. It is now growing between two fine orange trees which its owner desired to save and he had about decided to sacrifice the peach, but noticing the high quality of the fruit and its extreme lateness, has kept it from year to year. He has gathered fruit from the 15th of October to as late as the 15th of November. It is of exceptionally fine quality, very large and perfect fruit.

It was submitted to one of the larger peach dealers of Los Angeles and he thought that perhaps it might be an exceptionally high-grade Salway, or if not, a seedling from the Salway. Mr. Young should perpetuate this tree by budding at least a few seedlings to give it a thorough test.

NUTS FROM CHINA.

A subscriber in San Diego County, somewhat concerned over the importation of walnuts from Manchuria or portions of Northern China, has caused us to look up the matter somewhat, and we find that last year some $43,000 worth of nuts came into this country from Manchuria. The cry which has been raised is pronounced a "dealers bluff," for there can be no great quantity ever imported from that country.

However, along that line we may quote from Bulletin 204, by Frank Meyer, relative to walnut culture in China. Mr. Meyer says:

Manchurian Nuts.

"Nuts are appreciated by the Chinese to the same extent that they are all over the world, but nut culture is as little practiced in China as it is elsewhere, for nut bearing trees and shrubs seem to have the reputation of not needing much cultivation. One therefore finds that a great many of the various nuts obtained in China have been collected from trees and shrubs in a wild or semi wild state.

"The nuts which came under the writer's observation are as follows:

Walnuts (Chinese Name "Ho to").

"The walnut (Juglans regia sinensis) is a native of Northern China, and thrives to perfection in the rich, loamy soil of some of the broad, sheltered valleys of that country. In some sections the trees are grown in regular orchards, in other localities one finds them planted here and there as solitary specimens. The latter practice is especially common in the narrow mountain valleys, where terraces have often been made to supply the trees with a sufficient quantity of soil.

"The Chinese have not learned the art of grafting or budding the walnut, and all the trees, therefore, are seedlings. Hence there is an enormous variation in the habits of the trees and in the size and quality of the nuts. In some sections very superior strains of nuts exist, while elsewhere the quality is poor.

"In the vicinity of Changli, Chihli Province, there are some walnut orchards in which the trees vary to a remarkable degree. Some produce small, hard shelled nuts of poor flavor, while others bear fine large nuts with a really fine flavor, and having shells so thin that they can be cracked with the fingers like a peanut. Between these extremes one finds many gradations in hardness of shell, size and flavor. It is very likely that some kinds of these Chinese nuts may prove to be much hardier than our present Persian strain of walnuts, and in all probability they will thrive especially in certain sections of the southern Rocky Mountain region.

Wild Walnuts (Chinese "Shan ho to").

"At the present time the walnut is but very sparingly met with in the wild state. Northern China has been settled too long to afford us the opportunity of seeing much of her original wild arboreal vegetation. In the Pangshan district, however, to the east of Peking, one may still find a few specimens of the real wild walnut. They are found in the mountains, growing in ravines among large boulders. The trees are smaller and less vigorous in growth than the cultivated ones. The leaves and nuts are also smaller, and the latter less sweet than those from cultivated trees, but otherwies there is little difference."

SOME OLD GRAPEVINES.

Grapevines have been famous always for their longevity; in fact, it is doubtful if they ever die of old age, as even the longest-lived trees do. Pliny, the Roman writer, who was a great observer, mentions one 600 years old, and there have existed vines in modern times in Italy and France four centuries. An article in the Technical World tells of some of the famous old vines of California, which were introduced, probably from Spain, by the old Franciscan fathers, away back in the eighteenth century. Near Santa Barbara is a huge vine called "La Vine Grande," which so far as is known, is the biggest individual grape vine in the world. The trunk is ten feet in circumference and resembles the trunk of a big oak rather than a grape vine. Some of its branches are over four feet round, and the vine is trained over a massive arbor which covers a space of 10,000 square feet. This vine has produced as much as twelve tons of grapes in a single season. This vine is not as old as might be supposed from its great size, for it was planted by a Spanish woman in 1842.

The famous "Trinity" vine near Los Angeles—so called because it has three principal branches—is much older, though it covers only half as much ground as "La Vine Grande." It was a very large vine as far back as the year 1800. All these old-time vines are of the Mission and Rose of Peru variety and they seem to be immune to destructive phylloxera and other pests.

There is a famous wild grape vine on the shores of Mobile Bay, near Daphne, Ala., which is known as the "General Jackson' 'vine, from the fact that "Old Hickory" camped under it during his campaign against the Seminole Indians. This vine is over six feet around, and is believed to be upwards of a century old.—Phila. Record.

VIRTUE OF THE APPLE.

The following taken from the New York Tribune, is interesting, as describing the medicinal virtues of the apple: "Do you know what you're eating?" said the doctor to the girl. "An apple, of course." "You are eating," said the doctor, "albumen, sugar, gum, malic acid, gallic acid, fiber, water and phosphorous." "I hope those things are good. They sound alarming." "Nothing could be better. You ate, I observed, rather too much meat at dinner. The malic acid of apples neutralizes the excess of chalky matter caused by too much meat, and thereby helps to keep you young. Apples are good for your complexion. The acids drive out the noxious matter which cause skin eruptions. They are good for your brain, which those same noxious matters, if retained, render sluggish. Moreover, the acids of the apples diminish the acidity of the stomach that comes with some forms of indigestion. The phosphorus, of which apples contain a larger percentage than any other fruit or vegetable, renews the essential nervous matter of the brain and spinal column. Oh, the ancients were not wrong when they esteemed the apple the food of the gods—the magic renewer of youth to which the gods resorted when they felt themselves growing old and feeble. I think I'll have an apple," concluded the doctor.—Green's Fruit Grower.

Small Fruits and Vegetables

GARDEN FERTILITY.

A variety of crops is grown in the garden, hence a variety of plant food elements in the soil is necessary for large yields of well matured crops of fruits and vegetables.

Best gardeners everywhere invariably recommend extensive use of well decomposed stable manure, preferably that from the cow stable. But well decomposed manure of any kind on the average farm is a scarce article. Time is required for the fresh manure to decompose, and not many farmers have the time, or take the time, to place the product in heaps for this change.

Making a compost heap to supply fertilizer for the garden and flower beds is a good thing if there is time for it and the work can be done right. One trouble in piling manure and other trash for decomposition is that with heavy rains during the decomposition process much of the richness of the mass is leached out to soak into the ground where not needed. The loss from such leaching, of course, could be prevented by the construction of concrete or other suitable floor and walls for retaining the liquids leached out by rains, or by keeping the manure under shed or other shelter where the rains could not reach.

In general practice, however, for handling the manures produced at home for the best results with the least labor, it is best to apply them to the land as fast as made. In this way the labor of handling is reduced to a minimum, and any richness leached out from rains finds its way immediately into the cultivated soil where most needed. All of the fertility is saved on the spot and readily becomes available for the growing garden crops.

One of the best ways to fertilize the garden with manures produced at home is to begin to apply them to the garden soil in the fall as soon as the crops are out of the way. This can be done either before or after the fall or early winter plowing of the garden soil. With cooler weather and more stability of the animals, more manure will be made in the stables. As fast as this accumulates, every day if need be, clean out the stables, cart the manure to the garden and place either in heaps or spread evenly over the ground. If the garden is to be plowed yet this year it will be better to spread it. If scattered, apply thickly. With either piling in small heaps, or scattering the manure will have plenty of time to decompose and become mild and safe. The earlier it is applied and the more rains and mild weather the more decomposed and milder it will become.

If some is applied before the ground is plowed, and is afterwards turned under, it will decompose under the soil, giving perhaps better results than when allowed to rot on the surface. With decay and change of any manure, ammonia and other fertilizing compounds in the gaseous state are given off, hence with decomposition down in the soil these compounds are absorbed and retained. Some of them come in contact with insoluble minerals of the soil, dissolving them or uniting with them to make these refractory minerals available plant foods, as well as loosening up the soil and aiding the growth of beneficial bacteria.

We have begun to manure our garden this fall, spreading the stable product thickly upon the surface, in some places between the rows of growing crops yet on the ground. Already, with the abundant late summer and fall rains, this manure has begun to decay nicely. The richness is soaking into the ground, and the mild undissolved portions will be in perfect condition for mixing with the soil next spring to make it warm, light, and friable. We expect to cover the entire garden this fall and early winter with fresh manure from the cows' and horses' stables so that it will have time to become rotted, mild, and safe for use next season.

Not only common stable manure, but that from pig pens and poultry houses is good. In fact, the more kinds used the better, as more fertilizing elements will be furnished.

Where wood is used for fuel and ashes produced, this by-product of the stoves makes an excellent garden fertilizer, and is especially good for all kinds of fruit. But when applying wood ashes, never place them directly against green trees or other plants, and never place them with poultry droppings, or other animal fertilizers, as the two react chemically on each other to liberate ammonia, which contains nitrogen, one of the necessary soil elements for large and vigorous plant growth. If any absorbent is needed on the poultry droppings before removal from the houses, use dry soil or coal ashes. It is well to store both wood ashes and poultry droppings in barrels or boxes under shelter during the winter, and apply them to the garden immediately before planting time in spring. Both of these fertilizers work quickly when on or mixed with rich soil, and if no growing crops are there to utilize the fertilizing elements set free some of them are apt to be lost.

Wash water, containing soap and a variety of dirt, has some fertilizing value and may be applied to the garden at any time with profit.—Journal of Agriculture.

CARROTS—TOMATO BLIGHT.

We don't believe that carrots will prevent tomato blight, however, we give the following, written by a correspondent, Mr. Harold Ellis of Walla Walla, Wash., for what it is worth:

"Tomato blight, which has for years puzzled experts, and which even now is without an assigned cause, can be easily prevented, according to H. J. Brown, a truck gardener of this city, who by accident fell upon what he claims is an absolute preventive, if followed closely.

"His method is to plant carrots between the rows, and he is the authority for the statement that if this is done, blight will not appear among the tomato plants. He has tried this two years since he first discovered it, and although blight was bad among the tomatoes of this vicinity this year, his were not molested at all.

"The discovery came through the plan of Mr. Brown in planting root vegetables among those which grew fruit in their tops, in order to conserve his garden space as much as possible. Carrots were planted among some of the tomatoes, and other vegetables among others. The carrot rowed tomatoes had not a trace of blight, but the further back the tomatoes were from the carrots, the more blight appeared. While it is not thought any particular kind of carrots is required, the variety used by Mr. Brown was the Kuerande, or Oxheart.

"While science does not back this discovery, it is at least worth while in districts bothered with blight."

The Ornamental Garden

GARDENS OF THE WEST.

In no place do we find the garden more beautiful than in the West—spring, summer, winter, all the year around we have gardens resplendent with color and loveliness.

The long, hot summers are harmful not at all—the perfect irrigation system now prevalent throughout the country gives us the opportunity of having our lawns as green in July and August as they were in March and April.

The Wistaria Vine from Japan grows to great height and extreme beauty in California. One root alone will put forth a vine that will almost cover a house.

The Iris—boasted of by the Japanese is as magnificent as in its native home.

The Passion Vine, another climber, will run wild if watered extensively. I have seen one vine alone entirely envelop a large cypress and eventually kill the tree.

The geranium, usually potted in the eastern states, grows to a shrub in the West. It is now being used for hedges.

The ivy, or climbing geranium, will bloom so heavily that the blossoms obliterate the leaves.

The nasturtium—that daring little "runabout"—grows wild as a rule. It seeds itself from year to year and the colors are always changing of their own accord.

The dahlia is another bulb-plant that has become a great favorite because of its size and beauty. A late variety—the Poinsettia dahlia—is almost as handsome as the Poinsettia itself.

The chrysanthemum—a hot house flower—is now grown outdoors in great quantity.

The Oleander, that beautiful flowering shrub, grows to even greater size in the western states than in its native country, Algeria, North Africa.

The Mexican settlers of California are especially fond of this tree-like shrub, and an Oleander bush is found in almost every garden that surrounds a hacienda. The Mexican women in the southwestern states are extremely proud of their gardens and will carry huge bucketfulls of water—often from a great distance—to their gardens that every plant and shrub and bit of green about the home may thrive. They cannot always afford up-to-date plumbing, but they can afford a pretty garden and therefore do not find it too much trouble to carry the water from the creeks or roughly made wooden flumes that one sees so often throughout the country.

The Lilac is another shrub that grows to great size in the "Land of Sunshine." In the early spring the hillsides are a mass of blue with the wild lilac blossoms.

It is the intermingling of the wild and cultivated that makes the gardens of the western states an ever-changing novelty. Palms and pretty shrubs are planted within a few yards of giant oaks and redwoods; pampas grass flourishes beside Wild Madrone, Wild Lilac and various other trees and shrubs; lawns edge off into very carpets of wild flowers of every kind; pansies bloom beside the fair but uncultivated Eschscholtzia—everywhere you find it so and this mixing of the two is harmonious in color and appearance.

A handsome specimen of a climbing rose will reach the height of its ambition when it reaches to the top of an immense redwood tree.

In one country home I know of an ugly drainage creek entirely hidden by a double row of Calla Lillies which bloom far into the summer. These Callas derive their nourishment from the water of this drainage creek and the flowers grow to great proportions and beauty.

I have seen a bungalow built upon a barren, sloping hillside turned into a homelike nest simply by the careful planting of a garden. Climbing roses now adorn walls and veranda, fruit trees and elms thrive here and there about the place, a pretty lawn is always green, and the bungalow is surrounded by as pretty a garden as anyone could wish to see.

When people realize the value of flowers, the pleasure to be derived from the time of the planting of the tiny seed to the final blossoming of the flowers, they will have discovered the "bag of gold at the end of the rainbow"—that key to happiness which is within reach of all.—Irrigation.

BUDDING ROSES.

The season of the year is again at hand when the thoughtful gardener will get busy among his rose bushes which have not come up to his ideals in the character of flower he desires. Well established plants that have not, for some unknown cause, produced flowers of good form and substance, may be worked to such as seem best suited to the soil and environments, under his care. Buds set the first part of this month, will, if properly cared for make vigorous growth and produce fine flowers the latter part of the season, if they belong to the tea section of the family. There is one fact that must always be kept in mind when the work is done, namely: plants, like men and women have their affinities. Experiments have demonstrated beyond a shadow of doubt that some varieties of roses are not congenial to other varieties when the attempt is made to unite the two by the process of budding. It is for this reason that one firm in this southland use three species of roses on which to work the varieties in general cultivation. For a stock on which to work the fastidious Marechal Niel, the queen of the teas, Banksia is par excellent. On its own roots it is feeble and unsatisfactory, but on the Banksia it makes a prodigious growth, and blooms freely. A number of varieties may be worked on the same stalk. The idea, however, is not a good one. A number of varieties, grown on one bush may be interesting, but it is neither natural nor beautiful.

Soak seeds of cypress vine for a few hours in hot water just before planting. The hard seeds of the canna may need a bit of filing ere the germ can push its way out; but care should be taken not to injure it in the process.

The Japanese morning glory is slower in attaining the blooming size than the old-fashioned flower, yet its larger size and clear colors make amends for slower maturity.

A reliable authority advises us that if moles disturb the lawn and flowers, insert moth balls in their runs, and they will bother no more.

LILLY'S SEEDS

These 3 Vegetables for 10 Cents

This is not a bargain, but an introductory offer to get you interested in Lilly's Seeds, and to prove to you their quality and reliability.

LILLY'S "DELICIOUS" LETTUCE. A variety introduced by us, very early with fine, hard, medium-sized heads, rich yellow heart, with a delicious buttery flavor.

LILLY'S "EARLIEST OF ALL" RADISH. A very small, round, brought red radish with white, crisp flesh of a delicious, mild flavor. An excellent variety for cold frame.

LILLY'S "NEW WHITE QUEEN" ONION. A very early, small, round variety of fine, crisp flesh, with a deliciously mild flavir. A great favorite for the home garden, easily grown and matured.

The above three varieties are all regular 10 cent packages. We offer the three for 10 cents to introduce. Send money order or stamps.

Catalogue Ready for Mailing, Free

Send for a copy of Lilly's Annual Seed Book, 126 pages, fully illustrated with cultural directions.

Lilly's Seeds are the Standard of the West. They have given satisfaction to farmers for over a decade. They are particularly adapted to the climatic and soil conditions of the West Our seeds are tested by us before being offered for sale. We have an expert seed tester, a government graduate.

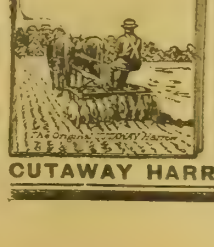
INTENSIVE CULTIVATION



HARROWS AND CULTIVATES.

With Clark's Original "Cutaway" Double Action Harrow and Cultivator you can do more different kinds of work with less effort than any other. It is the only Disk Cultivator that completely embodies the double action principle. It will do the work of several other disk machines that would cost you several times as much; do it more thoroughly, because it has 4 gangs instead of 2. Cuts the soil twice, throws in opposite directions, fills the hollows, leaves land level and true. The draft is always from the center—suitable for light team. All single action harrows run in half lap. Gang frame adjustable for cultivating rowed crops. Jointed pole. We make a "Cutaway" for every crop. Send today for our new catalogue, "Intensive Cultivation." It's Free.

100 CROPS

THE ORIGINAL "CUTAWAY."

CUTAWAY HARROW COMPANY 977 Main Street, Higganum, Conn.

TREES

3 REASONS

Why you should buy trees from us

FIRST—The completeness of our stock. We grow everything that grows—fruits, berries, grapevines, ornamentals, shrubs, plants, palms and roses.

SECOND—Every piece of nursery stock we sell is guaranteed "True to Name." This is very important, as it takes several years to find out what the "Fruits of your labor" are to be.

THIRD—We have been in business 28 years and in dealing with us you have the satisfaction of knowing that we are reliable and your orders will be filled properly.

TAKING CARE OF AN AUTOMOBILE.

The main cost of operation of the modern automobile is not in keeping the machine itself in repair, in the gasoline or lubricants it takes, but in keeping good tires on the four wheels. It seems surprising, after having so nearly perfected everything else, that the inventive ability of man should be so unable to lower the cost of tire maintenance. Without a doubt, it costs two cents for tires where it costs one cent for every other and all other things. We are not saying this because it may have occurred to us to say it in a casual sort of way, but because we have had the experience and know it to be a fact. If anything I here say about the care of automobile tires helps anyone to save an honest dollar, I will be glad of it, for rubber tires cost enough, goodness knows, and a little saved amounts to more than a little in dollars and cents.

The first thing to learn about the care of tires is to keep enough air in them. A great many, at first thought, somehow get a firm hold of the idea that the more air there is in a tire the harder it is on the tire. Let loose of that idea instantly and take the opposite one instead. The more air there is in a tire, up to a certain pressure, the easier it is on both fabric and rubber of which the tire is made. For a 32x3½ inch tire the air pressure should be kept up to eighty pounds, and other sizes in proportion. If you run a tire with insufficient air pressure the side walls of the tire bend at every revolution of the wheel, and the fabric will soon break at this point, just like a piece of wire will break after many bendings. Keeping insufficient air in a tire on the theory that it will not be so apt to blow out is a mistake, it will blow out quicker from too little pressure than from too much pressure, although it is not advisable to get them too tight.

After you have run a tire 1000 or more miles more or less, cuts will appear on the rubber tread, caused by stone bruises, running over pieces of glass and other sharp obstructions. Rubber companies now have on the market a sort of dough rubber, which can be handled like dough, but it will harden when exposed to the air for a time. It is a good idea to keep some of this on hand, and to stop all cuts and bruises in tires as soon as they appear. While this stuff will not last as long as raw rubber vulcanized into the tread, it will last for several hundred miles. The main thing is to keep all cuts and bruises filled, for it is this outer rubber tread that protects the inner fabric. It should be remembered that the outer rubber is for protection and the inner fabric is for strength. Both must be there, one to help the other, in order to insure long life.

One of the best investments an auto owner can make is the purchase of a portable vulcanizer. Out on the farm it is usually impossible to use the electric vulcanizer, so you will have to get one that is heated with gasoline or alcohol. The gasoline heated vulcanizer is very satisfactory. Such an outfit can be had for from $7.50 to $12.50, according to size. Directions come with it, and with the right kind of rubber stock to work with, you will soon surprise yourself in the good work you will be able to do. A hole in an inner tube can be vulcanized until the place cannot be detected afterwards, a much more satisfactory job than to stick on a patch, for patches will burn off quickly in hot weather, and let the air out at a most unexpected and inopportune time.

When winter comes and the roads are such that you will likely not use the car for some time, it is a good idea to let the air out of the tires, first blocking up under the axles. This relieves the strain and will help a little in the preservation of your tires. Keeping the mud and dirt washed off the tires is another help toward longevity, and keeping grease off the rubber is a greater means of preservation. Grease will rot rubber quicker than any other thing with which a tire is apt to come in contact, and the man who is careless in this respect is sure to pay dear for it.

As the preface to this article stated that the cost of operation was more in tires than in all else together, I would place the cost on a five-passenger car at three cents per mile for tires and two cents for gasoline, lubricants of all kinds and the probable repairs it might be necessary to buy from time to time. These figures are given from an experience of nearly two years in running a five-passenger car. Some may say the cost has been placed too high, and perhaps a few others will say it is too low, but I am figuring on a basis of doing all the work on the car myself, to keeping the auto itself in good running shape, the tires and tubes patched and repaired myself, and in the figures I give I have endeavored to allow myself day wages for the work done on account of the car. For the first 1000 to 2000 miles it is probable the tires will require no attention, except to see that the air pressure is up to full notch, and they are kept clean. Punctures may cause a little trouble occasionally but not much expense if you have the little vulcanizer to "cure" the tiny leak in the tube. Here in Kansas we have a great many hedges, and hedge thorns are productive of more or less punctures, unless you are careful. It is a good plan to run your hands over the tires quite often, feeling for these thorns. Sometimes they will stick in a tire for days without pushing in far enough to tap the inner tube, but sooner or later, unless they are pulled out, they will be crowded in. The thing to do is to pull them out, if possible before they go in far enough to reach the tube, and this you can easily do if you find them.

Lately I have been using an "inner shoe" in each of two old casings, casings that are too weak to hold without some inner protection. They cost $8.50 apiece, but I have not used them long enough to determine whether they will be money-savers or not. I have tried one set of treads or outer protectors, but I am of the opinion that the casings would have lasted longer without them than with them on. It is next to impossible to get them tight enough so they will not slip and chafe the rubber, especially on the back wheels, and this causes unnecessary heat, which rots and injures the life of the rubber more than the actual road contact. They are a good thing when the roads are very rough, frozen or rutty, but otherwise I am beginning to believe they are better off than on. I may be wrong in this, but I notice few around here are buying their second set of protectors.

Last of all, while the operation of an auto appears to cost some money, it gives back to the careful operator about all it costs, with a whole lot of pleasure besides. This farm is nearly eight miles from town. It is a hard half-day on the work horses to make this trip, and since getting the auto they have had to make it but a very few times, except to haul loads that could not be hauled in the auto. When the roads are too heavy for the auto

the fields are too wet to be worked, so the teams are able to go then, if it is necessary to go, but when there is work to do in the fields the roads are good then and the auto makes the trip instead of the tired teams. It is also easier on the passengers and a saving of more than 50 per cent in the time required on the road. But why go on to enumerate what the auto can do—the object of these articles was to tell what it cost to do it with an auto, and as nearly as I am able to tell it I have told it. Year in and year out, call it five cents a mile, and you'll not miss it far, unless you go at a reckless rate and treat the machine just as recklessly in every other way. —Wisconsin Farmer.

ALFALFA IN ROWS FOR SEED PRODUCTION.

Mr. P. K. Blinn, alfalfa specialist of the Colorado Experiment Station, with headquarters at Rocky Ford, Colo., has called attention to the necessity of planting alfalfa in rows for the most successful seed production. So much inquiry is being made at the present time that it seems advisable to again call attention to certain points which should be observed in growing alfalfa in rows for seed production.

The object of putting alfalfa in rows for seed production is to secure a greater control of the moisture. Under irrigation this greater control is obtained because by the row method the alfalfa can be irrigated by furrows. The furrows may be smoothed out with the furrowing machine so that the water may be run through quickly, thus giving a light irrigation. Cultivation of the rows assists in the conservation of moisture. Thus by control of the two factors, irrigation and cultivation, the necessary amount of moisture for the best crop development is secured. Too much water tends to produce vegetative growth at the expense of seed production. Under irrigation the rows should be planted 20 inches apart, and every other row furrowed out for irrigation. When, however, alfalfa is planted on dry land for the production of seed, the rows should be farther apart and the plants thinner in the row, in order to permit the amount of water commonly present to suffice for the plants which are actually on the ground. By dry land methods, the rows as a consequence should not be placed closer than 36 inches apart. The plants should be drilled in the row and may well be thinned to 20 inches apart in the row, leaving good, strong plants when the thinning is done.

Mr. Blinn reports that he saw alfalfa planted 40 inches apart between rows, and 40 inches in the rows, at Highmore, North Dakota, which yielded seed at the rate of five bushels per acre, where the rainfall was only seven inches for the entire season. From our experience and the experience of others on dry land, it would seem that 36 to 42 inches is about the proper distance to plant alfalfa in rows for dry land seed production. The alfalfa should be given as thorough cultivation as is given corn or potatoes. If this is done, a good average seed yield can be produced for each season. If thicker planting is made on the dry land, it does not leave a sufficient supply of soil moisture to mature a good seed crop. Success is only guaranteed when the number of plants is reduced to the carrying capacity of the soil.

Alfalfa growers of Honey Lake Valley, Lassen County, are harvesting a fine seed crop.

WEIGHT AND LENGTH OF ROOT SYSTEMS.

Different investigators have found the following amounts of root systems for the common farm crops. The percentages are based on the dry weight of the aerial part of the plant—that is, the part above the surface of the ground:

Clover roots, 100 per cent of the weight of the total year's crop; brome grass, 100 per cent; wheat, 45 per cent; oats, 45 per cent and 14 per cent; rye, 52 per cent; flax, 34 per cent; peas, 52 per cent and 9 per cent; barley, 13 per cent. These figures vary considerably, but they show that the root systems of plants are very extensive. There is a tendency for a greater development of root system under arid conditions, due to the greater distances which the roots must travel for water and to the greater difficulty which plants experience in absorbing the necessary amount of soil solution.

The total length of root systems of plants has been found to vary as follows: Barley, 128 feet; oats, 150 feet; wheat, 268 feet and 1800 feet; rye, 385 feet; a corn plant in the upper three feet of soil, 1,452 feet; and a full grown pumpkin vine, 15⅝ miles.

It has been observed that root systems tend to greater length in a richer and more porous soil. In one case a barley plant produced 128 feet of roots in a rich garden soil, and a similar plant in a coarse grained, compact soil produced only 80 feet of roots. Other conditions being equal, the root systetms of plants usually develop in proportion to the development of the aerial parts.—D. W. Frear, Colorado Agricultural College.

Live Oak, Sutter County, will plant large area to rice.

THE ECONOMY OF A PARCELS POST.

The more one considers the possibilities of a parcels post the more feasible it seems. Every thinking person marvels at the economic waste in the present day methods of city delivery. By your house in Yonkers, for instance—if you happen to live in Yonkers—there now rattle, once or twice daily, the wagons of your butcher, your baker, your laundryman, your milkman and your grocer, as well as those of the various butchers, bakers, laundrymen, milkmen and grocerymen of all your neighbors, all covering, in staggering wasteful duplication, the same route. Besides them, up from the city come, in further duplication and long distance waste, the wagons of the nine different New York department stores that deliver in Yonkers, the wagons of the four local express companies that divide the "independent" business, and those of the two general express companies which do the high priced long distance business. Yet, when you think of it, one wagon could come to you three times a day and do the work of all these people, more effectively and at one-tenth of the present total expense.—Fremont Rider in the World's Work for April.

IOWA THE AUTO STATE.

There were 28,000 automobiles in Iowa on July 1, 1911, the greater number owned by the farmer and villager. This is five to one as compared with New York state on the basis of population.

Flies kill more people than wild beasts and poisonous snakes. Many of these beasts and snakes never get a chance to kill any human being; but any one of the millions of flies found in most of our towns and cities has a chance, if he comes into a house carrying typhoid germs, of killing a whole family.

THANKSGIVING

And Holiday Supplies

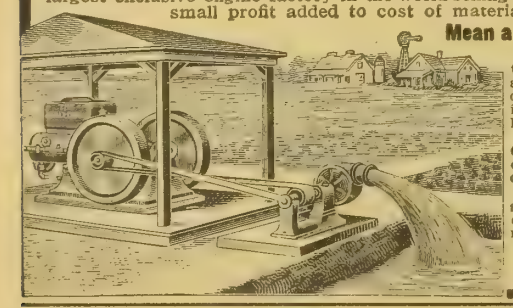
602 to 606 N. Main St., Los Angeles, Cal.

GALLOWAY

Pumping Engines and Centrifugal Pumps

MAKE the most economical and efficient pumping outfits on earth where large quantities of water are required. Galloway Pumping Engines are made in sizes to suit every purpose from 1½ h. p. to 15 h. p. They are built on honor, and so powerful, simple, economical and reliable that they are acknowledged everywhere as the most all-around satisfactory gas power possible to obtain. They are built in the largest exclusive engine factory in the world selling direct to the consumer with just one small profit added to cost of material and labor.



Mean a Saving to You of From 40 to 60%.

Galloway Centrifugal Pumps on account of the high efficiency obtained, their exceptionally simple design without valves or other complicated mechanism of any kind, are the ideal pumps for irrigation purposes or where large quantities of water are required.

A combination of Galloway Engine and Galloway Centrifugal Pump means ideal equipment at a great saving in price as compared with competitors prices.

Write us for full information. We have a special department for irrigation work with experts ready to work out your requirements.

Irrigation and Forestry

MILLIONS DUE CALIFORNIA.

By A. R. Kanaga.

Though our reclamation law was passed eight years ago, and our government is wisely spending $119,555,000 in reclaiming arid lands by means of irrigation, yet our state which has more arid and semi-arid land than any state in the Union, has up to the present time received practically nothing from this national fund. Let us see how the other states have fared.

Arizona	$13,640,000
Colorado	9,865,000
Idaho	19,719,000
Nebraska-Wyoming	10,280,000
Montana	15,695,000
Nevada	6,380,000
New Mexico	10,250,000
North Dakota	880,000
Oregon	6,060,000
South Dakota	3,000,000
Utah	2,063,000
Washington	11,558,000
Wyoming	6,750,000

California's sum total in one project up to this hour is only $620,000 and the combined so-called Oregon-California and Arizona-California projects will complete every ditch on the California side for less than $250,000 and the latter sum will not be spent for years in my estimation, making less than one million for California.

New Mexico has one single enterprise that will cost $9,000,000, known as the Elephant Butte, or New Mexico-Texas project.

We have more semi-arid land than Montana and I have been over that state from end to end, and yet they are in the front with $15,695,000 and our needs are the equal of that state, and we have the semi-arid land and the water just as they have, but those Montana men went after those millions while our people reposed in somnolence.

The land commissioners of Idaho in their last report say that 49 private irrigation companies are operating in that commonwealth. If that is true a very large part of their land is taken up and California has five times as much available land for irrigation as Idaho, and yet the latter gets $19,719,000 to our $620,000.

I have attended the last twelve sessions of our National Irrigation Congress, and when I contrasted the large attendance and vital interest of other states with the apathy of California as shown in her half dozen delegates, I was discouraged beyond words to express. Other states have been in this reclamation sack with both hands and feet in their wild scramble for money. You must remember that this money comes from the sale of public lands and our state has brought in fifteen times as much in this way as Arizona and some other states, and we have seven times as much arid land here as they have in the last named territory, yet they have secured $13,640,000 and our state $620,000. You ask what are we going to do about it. I answer, get to work. Lay these facts before your senator or your congressman and send some delegates from your country to Chicago, and attend our next National Irrigation Congress and show your interest in vigorous and aggressive action that one or two of the next projects taken up shall be in this state. Our state has today more than 1,500,000 acres of semi-arid land needing water. Yet this fund is being diverted to all other states but ours.

Now as for the Oregon-California, or better known as the Klamath project, they have in Oregon 300,000 acres, and about 10,000 acres in California, and nothing will be done to reclaim our land across the line for years to come. This $4,860,000 spent by the government was, and is, for Oregon and not for us.

Take the so-called Arizona-California project at Yuma. $5,000,000 is being spent here, and it irrigates 110,000 acres in Arizona and only a small tract over in California for only a small part is carried over on the California side, where most of the lands are included in the Indian reservation, and not $100,000 will ever be spent on the lands on our side of the line. These last two projects have been paraded before our people as California enterprises, or joint ones, with states named, and I protest against their being held up as California projects in any respect. They are Oregon and Arizona enterprises pure and simple.

Our government has now projects in course of building that are to cost when completed $119,555,000, and it is estimated that $50,000,000 will be spent by the reclamation service in the next five years, and unless we do something we will not get a dollar of it.

Now let us get something done for California, and do it right away. Let us commence on the Salinas Valley for here is the largest tract of semi-arid land in one body in our state. They have 400,000 acres of land between Salinas and Bradley. This land has today a nominal value of about $25 per acre, and with irrigation it is worth six to ten times that sum. No one need tell me that they have no water, or that the project is not feasible or that the land is held by large land owners.

What has probably misled the people was the belief that the so-called Oregon-California and Arizona-California enterprises were joint California projects and that as much money was spent for our own state as for the states of Oregon or Arizona, but in fact we got practically nothing from either, and I protest against these projects being paraded before the people as California enterprises, for they are not. I have been all over Southern California and they have a half million acres down there too costly for private enterprise, but capable of irrigating by means of storage reservoirs which our government can build. Two big projects are now due us, and the people down there should have one of them, for they deserve it, and will get one of them if they go after it.

320-ACRE HOMESTEADS.

The enlarged homestead law permits the entry by one person of 320 acres of government land in the arid states which is not, in the understanding of the government, susceptible of irrigation. As under the original 160-acre homestead law, this land can be acquired by the settler from Uncle Sam free of cost, on compliance with the regulations requiring a residence and cultivation. The determination of what lands are subject to these double-sized homesteads devolves upon the secretary of the interior, and since the passage of the act in February, 1909, 190,254,495 acres have been designated by him as subject to entry in units of 320 acres. Every month additional lands are thus designated, 90,242 acres having been added to the total in June.

OLIVE PICKLING.

(Continued from Page 483.)

try them every two hours and do not forget to draw off the solution and pour it back at each examination.

Freshening.

The olives are freshened in water to remove the lye. I throw a handful of salt into this water as it costs little and makes the matter safe. The salt water can be used to flush the drains out or on the asparagus bed to advantage. The exact length of time that it requires to make the pickle depends on the temperature. When the pickling is done in the packing-house cellars it takes a shorter time than when it is done on the packing-house porches. The cold air at night makes quite a difference in the temperature of the water. As soon as the lye is out of the olives we begin to salt them, using first three pounds of salt to the hundred pounds of water. Leave this on two days, then draw off and put on a six per cent, then an eight per cent. Some go farther and put on a solution as strong as twelve per cent. We do not like that much salt on ours. The last strength solution of brine should be boiled and cooled, and the olives washed by running cold water over them and the casks intended to hold them should be made thoroughly clean. Examine the olives, and any bruised fruit should be put into a bucket by itself for immediate use. After that the brine should be watched and in six weeks taken off and boiled again to be sure they are keeping.

Canning.

The simplest way to make olives keep is to can them. They stand cooking as well as any other fruit and are not at all hurt by it. In a small way use either tin cans or glass jars, wash and put in the berries by hand carefully, then fill the jars with boiled brine. The ten per cent solution is the one used commercially; we use eight. That is a matter of detail. Boil the brine the day before; skim it clean, and after filling the jars stand them up to their tops in a boiler of water and when the water around the olives in the jars has come to a good boil seal them up. We unearthed some over at the packing house that were over ten years old and found them perfectly good.

Others.

There are several other ways of fixing olives that make a pleasant change. The salted olives may be pitted and filled with thickened tomato catsup mixed with chopped red peppers. We had a Spanish cook who used to take a clove of garlic, add it to a gallon of olive oil, a little salt and one red pepper. He would then heat this up hot and pour over the olives in the glass jars, then seal them up. Everyone who ate of these olives after they were drained from the oil enjoyed them. The olive oil came into use for salads afterwards.

Dried.

The olive is liked by the Italians when dried. I confess I never have cared for them, as the bitterness is latent and raises up at the last in mighty power to put a disagreeable taste into the mouth.

An old French friend of ours makes the olives into candies just by taking them from the brine and pouring over them a heavy syrup made by using a quart of glucose to five pounds of sugar, pouring it over the olives while warm and letting them stand in it in open pans for forty-eight hours, then repeating the boiling of the syrup. The mingling of the salt and sugar gives a Chinese-like confection. After the syrup is well into the olives they can be put into jars and when wanted for use are served by rolling them in soft sugar and putting them on white paper above the stove in the dish rack where they dry out enough to be eaten without daubing the fingers.

In Gravies and Sandwiches.

I trust the time will come when we will make more and more use of olives. They are useful as an addition to duck gravy, and as a garnish and touch of flavoring to many dishes seem unknown to the average cook. Try making a sandwich by melting cheese in milk and adding chopped olives to it, flavoring with a little Worcestershire. Let this harden in a dish and then spread it lightly on one slice of thin rye or graham bread. The other slice of white bread butter lightly and lay on top.—M. E. Sherman.

NEW MOTORCYCLE FIELD.

While the motorcycle has made a great name for itself as a racing and commercial vehicle, it now comes to the front in Indiana and Kansas as a factor in education. In these two states it has been adopted by two students as a means of covering several miles of road between their homes and the school at least twice a day.

Having been adopted by the students the motorcycle is now in use by both student and college. The University of Illinois at Champaign, was the first educational institution to adopt it for the use of the students in the department of geology and the four machines have been in great demand for research purposes.

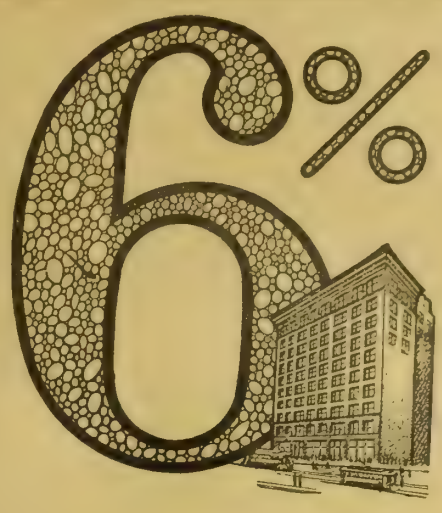
Thirty miles a day on a motorcycle to attend school is the feat being performed by Karl Dalrymple of Selina, Kansas. For two weeks he has been making the trip and has been so successful that he intends to keep up the daily trip during the winter unless the heavy snows blockade the road.

Students in several of the large universities of the country have adopted motorcycles to go from the college buildings to the city and to their homes.

OUR SUBMERGED RICHES.

Mr. M. O. Leighton, in the World's Work for November, says that the sum of all the unreclaimed land in the various states is 74,000,000 acres, and he figures out interestingly the amount of income that isn't coming in.

Swamp land that will not make a gross return of $50 per acre annually is very poor. Seventy-four million acres at that rate will yield $3,700,000,000. Reduce this figure one-half if you please, and what an addition we should still have to our annual wealth production!



6% is what your money should earn

Our Securities are backed by over $20,000,000 of Assets, chiefly real estate

We have several booklets telling you how we can pay 6% and all about our great real estate holdings. We will mail them free if you are interested. Write for one today.

SAVE YOUR TIME WATER and GRADING BY IRRIGATING WITH AMERICAN SURFACE IRRIGATION PIPE

The PIPE RECOMMENDED BY ALL USERS. It is the ONLY SCIENTIFICALLY CONSTRUCTED SURFACE IRRIGATION PIPE on the market. THERE'S NO ROUND SEAMS TO LEAK, retard the flow of water or weaken the pipe. This pipe is easily handled and cheaper than flumes. It will last a life-time. For irrigating alfalfa it is the only pipe to use. We make RIVETED PIPE AND TANKS. Write for Illustrated Catalogue, also SPECIAL IRRIGATION FOLDER which may mean much to you.

CONTENTS THIS WEEK

CULTURE OF THE DATE IN ARIZONA, Cover.

REFINING THE DATE, 481.

CITRUS AND TROPICAL FRUITS.—Lemon Freight Rate; Olive Pickling; 482, 483.

DECIDUOUS FRUIT CULTURE.—Picking and Marketing Apples; Walnut Bleach; Valuable Peach; Nuts from China; Some Old Grapevines; Virtue of the Apple; 484, 485.

SMALL FRUITS AND VEGETABLES.—Garden Fertility; Carrots - Tomato Blight; 486.

ORNAMENTAL GARDEN.—Gardens of the West; Budding Roses; 487.

GENERAL AGRICULTURE.—Taking Care of an Automobile; Alfalfa in Rows for Seed Production; Weight and Length of Root Systems; Economy of Parcels Post; 488, 489.

IRRIGATION AND FORESTRY.—Millions Due California; 320-Acre Homesteads; New Motorcycle Field; Our Submerged Riches; 490, 491.

EDITORIAL.—Christmas Shopping; Two Farms; Making Rain; Poultry Special; Percheron Society; Demonstration Train; Number of Animals; Corn in California; State Nurserymen; 492.

AGRICULTURAL NEWS NOTES OF Central; Central; The Coast; 493.
THE PACIFIC COAST. — Northern;

LIVE STOCK AND DAIRY.—Coloring; Keeping the Calves Healthy; A Big Sale; Range for Swine; Home Curing of Ham; Most Unique Banquet; The International; 494, 495, 496.

PROFIT IN THE POULTRY YARD.—The Stockton Show; Hatching and Rearing Turkeys by Artificial Methods; Success with the Incubator! Whitewash; The Weather Bureau; 497, 498, 499.

QUESTIONS AND ANSWERS.—Registered Cows; Weighing Olives; Rations for Colt; Grass Moth; Devil Grass-Salt Grass; Plowing Orchards; Overheated in Brooder; Chicken Pox; On Shares; Weevil; Seed Potatoes; Pure Bred Jerseys; Salt for Stock; Poll Tax; Biliousness; Salt Grass; Belgian Hares; Cowpox; Bulletin 71; Self-Sucking Cow; 502, 503, 504.

LEGAL.—Rental of Land; Recording Agreement; Pastured Horse; Acquiring Title; Inheritance; Title; 504.

HOUSEHOLD DEPARTMENT. — If We Had But a Day; On the Rosebud; Crumbs of Comfort; Homely Hints; Mustard; Adhesive Plaster; Lemon Syrup; Shoes: 505. 506. 507.

PRODUCE MARKET.—Los Angeles Market; San Francisco Market; Deciduous [illegible]

CHRISTMAS SHOPPING

Less than a month will elapse before Christmas shopping should all be done. We recall distinctly the few days preceding Christmas last year and the year before that and all other years since memory began, and Christmas shopping has always been the same. The awful rush of the few last days and the impossibility of getting proper attention from clerks and shopkeepers should impel everyone to consider what he wishes to buy at this time and have it in hand within the next few days.

TWO FARMS.

We recently saw the statement, "Every good farmer has two farms, the real and the ideal." It is possible some combine the real and the ideal, that is, they have what they maintain is their ideal of a farm. If there be such a case, the ideal is altogether too low. None of us have attained our ideals if they are what they should be. The aspiration should be higher than is possible for a human to attain, yet not so high that there is no hope of ever coming within reasonable distance of it. If our ideal has been low and we have reached it, a new one should be created.

MAKING RAIN

The farmers of a certain section of the west side of the San Joaquin Valley are showing themselves easy marks again for the so-called rainmaker who is signing up a sufficient number of farmers to provide him a good fat year's salary in case he "produces" ten inches of rain between November 1st and May 1st. Last year's rainfall in that section was 13.81 inches, and it is probable the rain will be "produced" and that the gullible farmers will again dig up the $2000 or $3000, or whatever the sum may be, and donate it to this fellow who sits waiting for the season to end.

POULTRY SPECIAL

The December number of the Rural Californian will be a record breaker. That popular monthly has been giving special attention to sugar beets, to cotton, and to apples in the past few numbers, and the issue for December will touch the biggest small industry in the United States, an industry for which its friends are now claiming a round billion of dollars every year. Yet it has been regarded as the smallest factor of our productive industries; it is more often a side issue in which the wastes of the kitchen are concerned than it is a commercial venture. But in its smallness it has become great and the poultry people are today talking of vastly bigger things for the future. Some of these points will be touched upon in the Rural Californian. It will be worth getting.

PERCHERON SOCIETY.

The Percheron Society of America is now sending out its official list of members, complete up to October 13th. In it California does not make so bad a showing, having 22 members. Of course that looks small compared with Illinois' almost 1000. Iowa comes in with 660, Ohio with 374, Kansas 253, and on down to the small eastern states like Delaware, Arkansas, New Hampshire, and others, with only one breeder each. The Percheron Society is now regarded as one of the strongest record associations. It has been attacked by friends of the former Percheron societies which maintained for years a hard struggle for existence, who regarded with dismay the rapid growth in membership of this organization. The directors are now asking every member to keep up records of their stock and post the central organization as to all doings among Percheron people.

DEMONSTRATION TRAIN

The Southern Pacific and University of California demonstration train is now working up the eastern side and down the western side of the Sacramento Valley. It started on Monday from Sacramento and will Sunday at Montague, touching during the next week at Gazelle, Edgewood, Corning, Hamilton, Orland, Germantown, Willows, Maxwell, Williams, Arbuckle, Dunnigan, Yolo and Woodland. It will later visit the southern end of the Sacramento, and the northern end of the San Joaquin will be taken in another trip, and we presume later the southern San Joaquin. In the spring months two trips will be made in Southern California and one up the coast.

This demonstration is well worth a visit from every producer in the section through which it travels. We believe that attendance of school children is to be discouraged and only producers are invited to come. While there is much of interest to school children it has been found that they interfere seriously with the gathering of information by those who come to the train for its educational value.

NUMBER OF ANIMALS.

The Department of Commerce and Labor is mailing its preliminary statement as to live stock on the farms of the United States. It shows the total valuation of cattle to be $1,484,889,647. This was an increase of .7 per cent over valuation by the census of 1900. Horses and colts showed an increase of 131.6 per cent during the same period. Mules and mule colts showed a still greater increase, 166.2 per cent. Even asses and burros show an increase of 125.3. The next greatest increase was in goats, 82 per cent. Poultry comes next with 78 per cent, then come swine with 71. Bees little more than hold their own with an increase of 1.9 per cent. This shows cattle to maintain the lowest rate of increase of any livestock, but it does show, slight as it is, that there has been an increase. This is contrary to the claim often made that the livestock industry has decreased during the ten years. In proportion to population this may be true. The increase in horses and mules is somewhat surprising in the face of the claim often made that motor vehicles would in time cause their complete disappearance. It does not look as if the horse had been materially affected by the coming of the motor as yet.

CORN IN CALIFORNIA

A Los Angeles County subscriber, Mrs. T. Silver of El Monte, recently brought to the office ears of corn which, while they might not win $1000 gold cups, yet are good enough to show that there are possibilities in this state for corn production. One good judge of corn examined them and stated that while the cob was a little large it was an excellent product. With the state importing millions of dollars worth of corn, there is no reason why we should not develop the industry. It is probable that the state can never become a great corn exporter, but it should at least produce enough for home consumption. Our climate is not perfectly adapted to most varieties which have been tested here, but there are other varieties and there are intelligent growers, and the search for a corn which will do well here should be continued.

We are glad to note that Circular No. 70, "Observations on the Status of Corn Growing in California," is now being mailed by the Agricultural Experiment Station at Berkeley. It is written by M. E. Sherwin. One of the first sentences in the Bulletin is: "The yield per acre in California is 34.81 or 9.3 bushels more than the average of the entire United States, moreover the farm value per acre is more than double that of the general average of the states." Then Mr. Sherwin asks the question, "Why is the acreage grown in California not greater?" The acreage now is 49,000 and the production, 1,838,000 bushels, valued at California prices at $1,470,000. The Bulletin is full of corn information and deals with the various problems from planting to treating the corn worm and use of husks for tamale wrappers.

STATE NURSERYMEN

Next Thursday, November 23rd, California nurserymen will convene at the Chamber of Commerce Building in Los Angeles and discuss matters pertaining to the nursery industry of this state. This will be the first regular meeting since the organization of this body at San Jose last June. At that time the Pacific Coast Nurserymens Association was meeting in that city, and the large number of Californians brought together because of it gave opportunity to take the first steps in organization. Geo. C. Roeding, President of the Coast Association, called the Californians together, commitees were appointed, officers elected and a constitution adopted. The President is W. V. Eberly and the Secretary is H. W. Kruckeberg.

At the meeting next week Thomas Chisholm will extend the welcome, Mr. Roeding will respond and President Eberly will make the opening address. Mr. Eberly has a reputation as a wonderful doer of things, but rather short on speech making, but on this occasion the boys are expecting a treat. President P. A. Dix of the Coast Association will make an address on organization and fellowship. This and all other addresses will be followed by short discussions. Other addresses will be "Buying and Selling Among Nurserymen," Fred H. Howard, of Los Angeles; "The Problem of Surplus Stock," Max Crow, Gilroy; "Credits in in the Nursery Business," Leonard Coates, Morganhill; "Growing Ornamentals that Sell," E. H. Rust, South Pasadena; "Conifers That do Well in California," J. J. Reeves, Beverly; "Novelties of Twenty-Five Years in California," John Vallance, Oakland; "Correct Nomenclature in Catalogue Making," Ernest Braunton, Los Angeles; "Federal Quarantine," Frederick Maskew, Los Angeles; "State and County Quarantine," Wm. Wood, Whittier; "Can Nurserymen Assist Inspection," F. H. Wilson, Dinuba; "Are We in the Tropical Fruit Zone," John S. Armstrong, Ontario; "California's Plant Debt to Australia," Theodore Payne, Los Angeles; "Exhibiting a Business Proposition," Philip D. Wilson; "Regulation and Stability of Prices," W. P. Weber, San Fernando; "California Field Grown Roses," E. Gill, West Berkeley.

Agricultural News Notes of the Pacific Coast

Northern California

Fresh grape shipping stil continues.

Ferndale held a pure food and fashion show last week.

Extensive levee work is being done in district No. 108, Sutter County.

The rice crop on the Balfour-Guthrie Ranch near Gridley is being harvested.

Santa Clara County Grange held its annual meeting at San Jose last week.

A rain of from a quarter to half an inch fell in parts of the valley last week.

Commissioner Galloway of Sonoma County reports nurseries generally clean.

Northern California has 12,000 cars of deciduous fresh fruits to its credit as the shipment of the season.

Ferndale, Humboldt County, is planning for a celebration in honor of the opening of its fine new bridge.

Oranges, olives and poultry are to combine in a great exposition to be held in Oroville early in December.

Fairoaks, Sacramento County, is shipping pomelos to Manila. The fruit is handled by the Fruit Growers Exchange.

Santa Rosa people are making extensive preparations for entertaining attendants at the State Fruit Growers Convention.

It is reported that a government experiment farm is to be established somewhere in the delta region of the Sacramento River.

Butte County's foothills are said to be full of both brown and black bears and many are being sent into the San Francisco markets.

A Colusa County fruit grower received from his two acres of prunes $825, and from one season's fig crop from one acre, $320.

A Contra Costa County dairyman has purchased a large tract and will establish a model dairy farm at Meridian, Sutter County.

Haywards is having experience with a chicken thief and he is having experience with Haywards, for they now have him behind the bars.

The demonstration train is touring up the eastern side of the Sacramento Valley this week, and will make the down trip on the western side next week.

The large classes attending the horticultural and entomological short courses at the University Farm are finding much of interest in the course as laid out this year.

The new Deciduous Fruit Growers League is rapidly assuming form and it is hoped will be as much of a factor in advancing deciduous interests as is the citrus league.

Extensive irrigation plans are perfecting for Contra Costa County to cover lands near Martinez, Antioch, Concord, Walnut Creek, Byron, Oakley, and other points.

The supervisor and rangers of the Plumas National Forest are jubilant over their fire record for the past season. They claim that less than one-sixth of one per cent of the total area of forest in their charge was burned over this season. There were, however, 70 fires discovered, most of which were put out before doing any damage.

Central California

Salinas boosters are working for a starch factory.

The Chamber of Commerce of Salinas is working for a vegetable cannery.

Fresno has entered the field as a candidate for the 1915 Irrigation Congress.

Fresno is testing out a new stump-pulling machine which is claimed to be a marvel.

Several sections of Central California are much torn up over location of the state highway.

H. R. Cox of the Bureau of Plant Industry is investigating the weed situation near Salinas.

A Porterville fruit packer has invented a box labeller capable of doing 3000 boxes an hour.

One fruit shipping firm at Hanford, Kings County, sent out during the last green fruit season over 150 cars of fruit.

Every packing house in Porterville is busy, some of the earlier shipments going to Canada, England, and even to the continent.

Five thousand loaves of bread will be distributed by the Raisin Day Committee at the Omaha Land Show. They will be 4-ounce loaves.

The raisin market is reported as exceptionally strong and this notwithstanding the desperate effort of packers to bear the market.

The raisin market having strengthened materially in eastern points, growers who have not sold are holding for the top of the market.

Stock growers of Tulare County are pressing the demand for increasing number of stock allowed on the Sequoia Forest from 11,000 to 12,000.

Kings County Holstein-Friesian breeders are uniting in forming a breeders association to affiliate with the recently formed state association.

Owing to criticism of the Pajaro Valley pack by Chicago dealers it is urged that an organization be formed looking toward more uniform fruit and packing.

Plans for a new weir are being made by the Empire Investment Company, to be located in Kings River southwest of Stratford. It will divert water for West Side lands.

Poultrymen at the Stockton Poultry Show last week were greatly pleased at the fine showing of silver cups which was made. It is estimated that over $1000 worth of cups was taken away.

Irrigators at Modesto last week made a strong appeal to Governor Johnson for a special session of the state legislature to consider amendments strengthening the bond irrigation act.

Congressman Needham recently held a conference with farmers at Stockton regarding losses from flood waters of the San Joaquin. It is urged that congress aid in draining away these flood waters.

Shima, the Jap potato grower, who raises thousands of sacks on the rich lands near Stockton, says that his success with potatoes has been largely through seed selection and growing a superior potato.

Southern California

San Diego County public schools are teaching the art of poultry raising.

The Palo Verde Valley in Eastern Riverside County, is building a cotton gin.

Orange County citrus growers have decided to send out no Thanksgiving oranges.

Anaheim has taken up the shipping of walnuts to Europe. This is truly carrying coals to Newcastle.

The upper Yucaipa and Oak Glen country will market during the coming season about 75,000 highest grade apples.

One of the uinversal fiber gins for handling long staple cotton is to be constructed at Brawley, Imperial County.

The Growers Protective Association of West Riverside met and discussed matters pertaining to their industry last week.

Thirty-five cars of sheep were recently sent to Holtville, Imperial County. This was the second bunch in two weeks.

Horticultural Commissioner S. A. Pease of San Bernardino County, reports many calls for remedies for gum disease of citrus trees.

El Centro is making great preparation for its coming county fair. One day of the week will be set aside to each town of the Valley.

The California Creamery Operators Association will convene November 24-25 at San Luis Obispo. F. H. Daniels of Alameda is secretary.

The Palo Verde Valley is objecting to the bad road from Glamis to Blythe and now proposes to open a fine roadway to the Santa Fe on the north.

G. Harold Powell of the Citrus Protective League is on his way to Washington to confer with the committee of congress in regard to the lemon tariff.

The packing house of the Anaheim Walnut Association has shipped during the season 475 tons. It has been a prosperous year for the co-operative organization.

The Limoneira Ranch at Santa Paula is making careful observations as to productiveness of certain lemon trees and proposes to keep a record for a period of years.

The horticultural commissioner of San Bernardino County has been appealed to for inspectors for the apple district along the Mojave River. As yet it has not been deemed advisable.

Anaheim walnut growers have had trouble with walnut thieves during the season and now have a gang of Mexicans behind the bars for stealing walnuts, sometimes carrying off whole sacks.

The Redlands Co-operative Fruit Association is securing new membership and signing up many additional acres. The new officers for the coming year are Mr. Gore, President, and H. W. Seager, Secretary.

The Imperial Valley will require 1500 kegs of nails, 50,000,000 wrappers and 1,000,000 crates to accommodate its cantaloupe crop next season. It is estimated that next season's crop will require 2500 refrigerator cars to handle.

The Coast

Eggs at Seattle, Wash., are selling for 50 cents.

Potatoes are now selling for $25 per ton in the Seattle market.

Tacoma received 2270 cars of wheat during the month of September.

A convention of dairymen was held at Kennewick, Washington, last week.

The Yuma Valley is now sending cars of fat hogs to the Los Angeles market.

Farmers at Garfield, Washington, are entering more generally into pork raising.

Wenatchee, Washington, shipped 1500 cars of fresh fruit during the past season.

A potato grower at Enterprise, Oregon, reports 914 sacks of potatoes from ten acres.

Cattle growers are offering $30 per head for yearlings on the ranges at Pendleton, Oregon.

The price of hogs at the stockyards at Portland has declined until now $7.25 it top notch.

Wheat buyers at Portland, Oregon, are playing a waiting game, offering only 79 to 80 cents for Club.

Spokane hopes to have Governor Judson Harmon of Ohio to open its apple show on November 23rd.

Churchill County, Nevada, sent a special car of agricultural products to the Land Show at Chicago.

High prices of barley in California are causing more general shipment of Washington oats to that state.

Oregon has a new irrigation law which it is expected will soon be tested out in the supreme court.

The Asotin County Poultry Association will hold its annual show at Clarkston, Wash., early in December.

Yakima apple growers are elated over winnings of Yakima Valley apples at the New York Land Exposition.

The Agricultural College at Bozeman, Montana, will send a judging team to the International at Chicago.

A great snow storm swept over the eastern portion of Washington last week, but soon disappeared in a rain.

Officers of the reclamation service recently made a visit to the Laguna Dam across the Colorado above Yuma on inspection trip.

A deal was closed at Portland, Oregon, last week by which 2500 bales of California, Oregon and Washington hops go to London.

The pupils of Snohomish, Washington, High School recently won the Great Northern Live Stock Cup for judging stock at Puyallup Valley Fair.

Bean growers at Kendrick, Idaho, have been so successful this past season that another year will see great extension of bean planting in the Potlatch section.

Potato growers at Waterville, Washington, held a combination potato and baby show last week. The potatoes were given a $50 prize, but this was greater than the baby prize.

The state school superintendent of Washington has agreed to join in the anti-smut campaign which wheat growers of that state are making. He will distribute to all teachers circulars touching upon the scientific and practical side of the smut question.

MAN MUST EAT

There is money in

SUGAR and CATTLE

Share in the profits of an agricultural investment, comprising over 21 square miles of rich agricultural lands.

The land has an abundance of water in a district where irrigation, drought and frosts are unknown. Large tame grass pastures have just been prepared.

The land is free from incumbrances, which affords our investors the highest degree of security.

THE PRODUCTS OF THE RANCH ARE CATTLE AND CANE SUGAR, TWO OF THE WORLD'S BIGGEST DIVIDEND PAYERS, AND ON WHICH THE MARKET IS STEADILY ADVANCING.

In this district lean cattle fatten in four months in tame grass pastures and increase 50% to 100% in value.

Cane sugar is manufactured at one-third the cost of beet sugar.

Additional capital is required for improvements and to buy cattle to stock the ranch. A limited amount of investment certificates will be issued in units of $100 cash or on installments. Six per cent per annum interest is guaranteed, and we also share the profits with you. Option given to withdraw your money and profits or to become a part owner of this great property.

Applications for certificates will be filed in the order received. This enterprise is backed by some of the most substantial and well-known business men of Los Angeles. We invite the strictest investigation.

Send for free booklets and descriptive literature.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

COLORING.

By Mrs. M. E. Sherman.

The Fresno Fair has passed, and the winning cow in the butter contest was entered as a red Friesian. The Shorthorn judge looked over the cows and asked me if the Friesian breed of cows did not look very much like the first cross of a Holstein bull on a good milking Shorthorn. The type was purely Shorthorn. The Jerseys of Mr. Locke were very beautiful animals. I wish all Jersey men could see these cows, as they are true to type. I was glad to see them come out as well as they did in the butter contest. They were in the noise and confusion all the time, and this is, of course, a poor way to make big records. The cows in the East that are making big records are treated like patients taking a rest cure. They have a light screened house to live in, apart from the populace of the barnyard. They are brushed and groomed, in other words are massaged, in the pink of condition, and fed every few hours, each time with something tempting. One man milks them and cares for them, giving his entire time to it. If it is in summer, an electric fan and a darkened room tend to slumber and rest. In winter, a well warmed room with warmed drinking water is in use. Everything is kept quiet and peaceful in their apartment. These fair records require a cow with little nervous organization to go through them successfully.

Two Fairs.

While the Fresno Fair was much the larger, the Hanford Fair was more like the fairs of years ago. It was straight argicultural, without the vaudeville. Both fairs had a beautiful ring of saddle horses that tiptoed around full of the poetry of motion. The women on saddle horses as usual had stiff animals that did not seem to have the springs under them. I cannot understand why women should not ride the beautiful trained horses. Their manners are perfectly good, and I would always rather trust a horse with spirit than a lunky animal. I had a friend that bought a horse on the recommendation that Sam was fit for women to drive, as he was so gentle that he would stand on the track if a train struck him. He did this very thing one day when a flying box car came. Sam could not wake up. Fortunately the rear wheels only were struck, as the car came to a stop under breaks. I don't want such a horse. I want one that will see things and get out of their way when they come too close.

Cow Colors.

It is not always easy to tell why we know the breed of a cow at sight, and the colors may vary considerably in the same cow at times. Registered Ayrshires are handsome animals, having horns that are carried up and forward, and are longer and more slender than Holstein or Jersey horns. The handsomest Ayrshire markings are the nearly white ones with red side panels on the neck and cheeks, and a few red spots or red roan spots on their sides. The head is carried high and the cows are alert looking animals. Other colors are nearly all dark red or with some white; then there are red brindled with black. The type of cows known to the Eastern farmer as "Homies" are low set in their bodies with great roomy stomachs. The old Eastern ideal of a farm is to have a good cow, for they say, "No cow, no home." This would not apply in the West, for many a home has only a tin cow, and yet the love that makes any spot a home is there.

Guernseys and Jerseys.

The Guernsey is red and brown and white, or all these colors mixed. Like the Ayrshire, she may come in other tints to match her mistress' gowns, but these are the colors I have seen her wear. I have not the official book to know exactly what colors are a la mode in her style book. The Guernsey is a little larger and heavier cow than the Jersey. Her special claim, outside of being a heavy producer of butterfat, is in the high color of her milk and butter. A few Guernseys are often kept in a herd to raise the color of the milk. The Jersey colors are the soft pastelle colors, as beautiful and as softly shaded as the light on the brown hillsides, light cream to darkest tan shades, from light silver to silver black. Often the light silver have black trimmings in tail and legs. With the season the coloring varies in intensity. White is often found on these cows as well. The nose is black with a mealy ring around it, while in the Guernsey the white or lighter colored nose is desirable.

Durhams and Holsteins.

In the early days the name Durham was applied to cattle. Then we had the Longhorn and the Shorthorn Durham. Most of the grade cows in California that have good blood behind them are Shorthorns. There are some splendid milkers among them. The colors are red, white and roan, and brindled red. These colors are all permitted in the show ring. The finest of the bulls in this year's show ring have been red roans in the aged classes, with one fine two year old pure white, and several solid red yearlings. The expression in the face of a roan bull that weighed twenty five hundred was as peaceful as a calf with its stomach full of new milk.

The black and white cows are Holsteins. The pure bred ones must have white terminals. Legs must end in white, and the tail must end in white. No gray or red markings are permitted, neither can an animal be registered that is pure white. The blue roans are superior cows usually at the milk pail. These are gotten by mating the Holstein sire with the red roan Shorthorn cow. I have had some that milked eight and nine gallons a day from this crossing.

Dutch Belted.

The Dutch Belted cattle are beautiful cows, as everyone that has seen the Strader herd from Ceres must admit. They stand well in milking contests. Mrs. Strader is a lover of cows and greatly interested in these cattle. The young males sell readily to head herds of grade cows. Some of these grades will probably be as well marked as full bloods. These interesting animals are often confounded with the Holstein. The historians of both breeds argee that they are distinct as

far back as they can be traced. The Dutch Belted are black animals with black legs and tails, but around the center of their bodies is a broad band of pure white. They are picturesque in the green fields, and we hope that there will soon be more herds of them in California.

KEEPING THE CALVES HEALTHY.

One of the most persistent difficulties in calf raising is scours which is frequently caused by injudicious feeding.

The pails used in feeding the calves should have all cracks and corners soldered so that they may be easily cleaned. Thorough scalding is necessary to safeguard the calf. Dirty feed boxes may be another source of contamination.

Probably the most prevalent cause of scours is overfeeding on milk. While some feeders have been successful in feeding sixteen to eighteen pounds of skimmilk daily per calf when the latter is three to four months old, there are others, and among them some of our best dairymen who find it advisable to feed only eight to ten pounds daily per calf, and would certainly not recommend over twelve pounds. The feeding of milk cold or sour, or the feeding of milk sweet one meal and sour the next, are other serious causes of scours. The mixing of the grain with the milk, thus encouraging the calf to gulp it down without proper mastication with the saliva in the mouth, may be a serious cause of trouble.

The grain and roughage given the calf to balance the skimmilk or sudden changes in the feed ration, have much to do with the condition of the calf's alimentary tract. It is difficult to specify just what feeds may or may not be used. Some feeds, laxative in their character, as bran and linseed meal, may be used to advantage, while soy beans are a notable example, which it is difficult to feed to the calf without causing scours. Shelled corn is less likely to cause scours than corn meal. Kafir corn is constipating in its effects.

Feeding the same time each day with the same quantity and quality of milk, has much to do in maintaining a healthful condition of the calf. With this should go the precaution of providing a dry pen, warm and well ventilated in winter and cool in summer. The calf is sensitive and should have kind treatment. The successful calf feeder will watch his calves closely, and at the first signal of scours will cut down the supply of milk; at this time a couple of tablespoons of castor oil in scalded milk may effect a cure. Persistent cases will require more strenuous treatment.—D. H. Otis, Experiment Station, Madison, Wis.

A BIG SALE.

Mr. George A. Smith of Corcoran reports 110 registered Jerseys sold at his recent public sale of pure blood stock. The highest sale was for Gerty's Son 66463 to J. N. Lester for $975. Highest price for a cow was for Victor's Hope to Jersey Queen Farm for $445. Other sales range from that on down to $30 for a three day old calf. Amongst the other purchasers were: Teague's Farm and Dairy Co., I. H. Smith, D. F. Conant, W. N. Snedigar, S. A. Holtman, J. W. De Witt, T. B. Harrison, Charles Odell, N. H. Locke Co., Palm Fruit Co., H. G. Gross, F. E. Thayer, R. L. Waltz, C. A. Pearis, T. W. Cheney, W. J. Webb, Mrs M. A. Musgrave, S. B. Wright, Bresee & Frasier and N. Wolfskill.

RANGE FOR SWINE NECESSARY.

While a few swine can be raised confined in limited quarters, if such quarters are kept clean, they will do better, will keep in better health, and can be grown more cheaply if they have plenty of range for pasture. It is desirable to have the pasture fenced off into suitable areas so that the hogs can be shifted from one pasture to another, not only to provide fresh pasture, but also to afford an opportunity to disinfect the pastures, either by plowing and seeding to a forage crop or by exposure to sun and weather. Nearly all cases of intestinal worms, which are rather common in swine, are contracted from infected ground, and swine can be kept free from these parasites by frequent changes of pas-

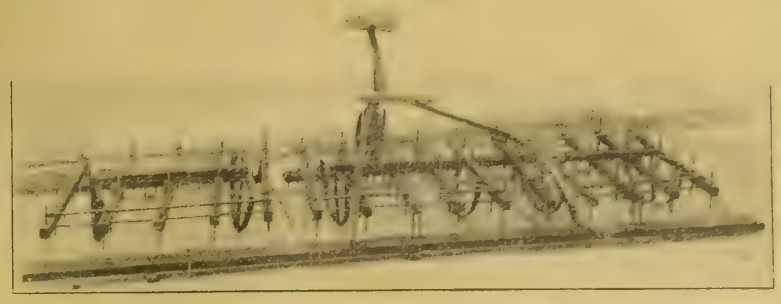
The New 20th Century Harrow

Patented



This Shows a 3-Section (90 Teeth) Six-Horse Harrow

This unexcelled, improved, automatic, self-cleaning harrow, which can be operated by a twelve-year-old boy, is a great labor saving device.

The above illustration shows with what ease harrowing can be done by this method, as a riding cart is attached to our harrows, and the operator simply presses a foot lever when he desires to clean the harrow from rubbish, and then the harrow cleans itself automatically.

The old method of cleaning harrows, requires a great deal of strength and labor, as every farmer knows, and by nightfall the operator is exhausted, while with this new invention there is no strength or hard labor required.

Our standard, seasoned oak frame harrow is five feet long, five bars to the section (30 teeth to the section), and as many sections as are desired can be used. The illustration also shows a rear action which may be desired by some farmers. This action is extra. It drops to the ground while the main harrow is in the air cleaning itself.

You can use the teeth from your old harrow, as we can supply the harrow complete without teeth. Holes for the teeth bored to order.

The self-cleaning attachment can be purchased separately and you can attach it to your old harrow. The riding cart can also be purchased separately.

This self-cleaning attachment can also be supplied for traction purposes. It is equally good for light and heavy work.

Any size harrow made to order. Write for prices.

Get 2 to 6 Lbs. More Milk per Cow a Day

From the Alfalfa You Feed

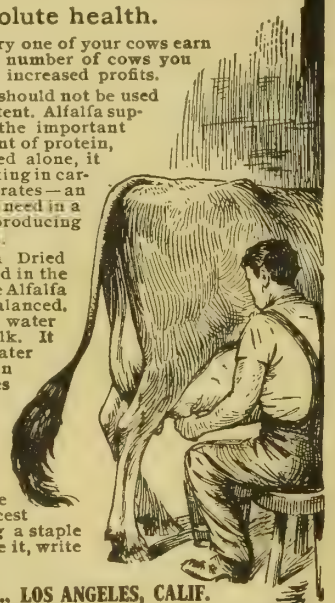
Alfalfa is a good milk producer—but you can feed it so as to get 2 to 6 pounds more milk per cow a day.

Your cows like it—but it can be made still more palatable. It is a healthful feed—but it can be fed so as to insure your cows being and keeping in absolute health.

Alfalfa fed with Steam Dried Beet Pulp will make every one of your cows earn $10 to $20 more a year. Multiply these figures by the number of cows you own and you can safely count the result as your increased profits.

Alfalfa is an unrivalled feed for the dairy cow—but it should not be used alone. Cows need variety. They are human to that extent. Alfalfa supplies the important element of protein, but, fed alone, it is lacking in carbohydrates—an equal need in a milk producing ration.

STEAM-DRIED BEET PULP
Just Like Roots
Makes More Milk



Steam Dried Beet Pulp is the ideal combination with Alfalfa. Used in the proportion of 8 lbs. to 15 or 20 lbs. of Alfalfa Hay—all the Alfalfa a cow will eat—gives a ration almost perfectly balanced. It is light, bulky, succulent, easily digested, absorbs water quickly and swells to about six times its original bulk. It is cheaper than bran or rolled barley, and it is a greater milk producer. Steam Dried Beet Pulp is the clean beets dried by steam as soon as the sugar factories have extracted the sugar. Be sure you get Steam Dried. It is uniform in quality and color, never burned or blackened by smoke, always clean and pure. Keeps indefinitely. For convenience in handling, it is packed in 100 lb. sacks.

Steam Dried Beet Pulp is also a splendid food for horses, pigs and poultry, and raisers are placing more and more dependence upon it as a feed for their choicest stock. Steam Dried Beet Pulp is rapidly becoming a staple product among feed dealers. If yours does not handle it, write us direct. We will see that you are supplied.

THE LARROWE MILLING CO., 607 Central Bldg., LOS ANGELES, CALIF.

THE HOME CURING OF HAM.

There is no other product of the farm to which the owner points with greater pride, than to his abundance of well-cured hams, one of the daily essentials for the table, and if the ham is well cured and well cooked, we certainly have one of the most appetizing dishes which can be placed before us.

This edible need not be limited to the farmer alone; those of the city may enjoy, equally with him, by purcasing the slaughtered hogs, or hams of the butchers, then using a good method of "sugar curing."

It is economy to those in the city, and a profit to the farmer should he place his home-cured hams on the market; there is always a ready sale, and they bring much better price than the packer's meat or the ordinary salt ham.

Should we decide to market our own "homemade," "sugar-cured" hams, there would be a very great demand for them. Each year we are compelled to refuse a number of would-be purchasers.

To all interested in the sugar-cured method of preparing it, we give the following recipe:

For 1000 pounds of meat, take 40 lbs. of common salt, 10 lbs. Orleans sugar, 4 lbs. black pepper, 3 lbs. saltpeter, ½ lb. Cayenne pepper. Mix thoroughly, then rub one-half of the mixture on the meat, let it lie two weeks and then rub on the remainder, after which let it lie four weeks, then hang and smoke.

As soon as the animal heat is out of the meat, apply first half, carefully covering skin and flesh side alike, and well over hock bone.

The extra expense over salted meat is small and I think about equals other methods of curing; the amount of labor required for first application is very little more than ordinary salting, and for second, requires one man about one hour. If you wish to cure smaller quantities, time and labor will be in proportion.

Do not think the quantity of the preparation too small when mixed, for although it may look so, yet it is an abundance.

As this is put on the meat, each ham is placed separately upon a platform, there to await the second application, when it is again placed for the four weeks, after which we hang and smoke four days from wood fire, not being partial to hickory wood.

By this time the meat is firm and dry, and it is wrapped in newspapers, then placed in sacks made of denim, or rather strong material, and hung in a cool, dark place.

We have used this recipe for fifteen years, have never had a ham spoil and have never eaten better.—Farm World.

THE MOST UNIQUE BANQUET EVER HELD.

One of the largest and most important meetings of livestock men will be that of the Second Annual Meeting of the Northwest Angora Goat Association, which will be held at Dallas, Ore., January 3-4-5.

The membership of the association in point of numbers is perhaps the largest in the West, it having members in every state in the West and in many of the Eastern states. The Mohair industry of the Northwest has grown in the last few years to that of one of the leading pursuits of the Northwest farmer. The endless tracts of cheap lands are being utilized more and more each year in the raising of Mohair goats, and it may be said to be the most profitable of all the branches of the livestock industry, owing to the comparative cheapness of the lands over which they run. Being browsers, they serve a dual purpose—clearing the lands of brush and weeds, and in the production of mohair, an ever staple article.

Figures submitted by Secretary Alva L. McDonald show that there was produced in the West in the year 1911 nearly a half million pounds of first class mohair, which sold for approximately $150,000. The present profitable condition of the Angora goat business causes the breeders to feel in a very optimistic humor, and consequently great plans are being worked out for the annual show. There will be over $1,200 in cash premiums and prizes, besides many valuable and costly specials.

The Dallas Commercial Club has donated about $500, while the association will offer some fine premiums which it is expected will arouse keen rivalry among the breeders. One of the most important features will be an "Angora venison banquet" given by the Dallas Commercial Club to the members of the association, in which the chief course will be roast Angora kid. It is claimed that this is the first of its kind ever given, and the large banquet hall of the New Scott Hotel will undoubtedly be crowded.

Governor West of Oregon will be present, as will also Dr. James Withycombe of the Oregon Experiment Station and C. C. Chapman of the Oregon Development League, while other speakers have been invited and are expected. The railroads have granted special excursion rates from all points in the Northwest, while the Southern Pacific will grant half fare on all shipments of livestock. W. A. Ayres will have charge of the stock exhibit, and will mail out premium lists at once. For railroad rates, reservations, etc., those desiring to go should address the secretary, Alva L. McDonald, Hamilton Building, Portland, Ore.

THE INTERNATIONAL.

Preparation for the International Live Stock Exposition, which will this year be held at Chicago from December 2 to 9, is no insignificant task. Hundreds of artisans consume a month or more in carrying out plans laid down long previously. Material by the trainload is consumed, and each year finds new ideas adopted for the benefit of show men and the comfort of visitors. In these preliminaries thousands of dollars are expended, practically all of which is merely seasonable investment.

On the eve of the opening of the exposition interest was never as keen. All over the country a host of exhibitors are getting livestock into show condition. Breeding and fat stock is receiving finishing touches at the hands of the master fitters and feeders of the country, loading day being anxiously awaited. The public sees only the culmination of this titanic effort.

You need this wisdom and experience. It will help you to be a better farmer and a better stock raiser. You cannot reap unless you sow; you cannot make progress unless you know. Know more and you earn more. Exchange small profits for larger profits. Get up a few rungs on the ladder of success. Become a breeder and raiser of good livestock. Many of the exhibiting prize winners at the "International" last year got their knowledge and inspiration but a few years ago, at the great show that is now willing to recognize and reward their efforts.

The International is your opportunity; it is your great chance to develop by applying practical knowledge and methods with a certainty of practical results.

Profit in the Poultry Yard

Practical poultry people who may have ideas from their experience as to methods of feeding and housing and general care of poultry will confer a favor upon the Cultivator and its circle of readers by sending in concise accounts. Mrs. Basley is always willing to answer queries, which with the experience of others should make this a most valuable feature in poultry life on the Coast. Opinions or matters of a personal nature should be omitted, but a concise statement of facts is always valuable.

THE STOCKTON SHOW.

The Stockton boys feel very proud of the results of their efforts in the show line. There were 1000 entries in the poultry classes, 600 in the pigeon classes, and the claim is freely made that it was the biggest ever in that part of the state. In pigeons there were over 38 varieties with over 100 colors and markings and the exhibits came all the way from Los Angeles to Seattle. In the poultry practically every class was well filled. The immense tent gave abundance of light and room and a most comfortable place for the exhibition. In addition a commodious hall across the street gave opportunity for the lectures which were delivered each afternoon. The principal lectures were by Mrs. Basley, Mr. McIntosh and Mr. Hitchcock.

One feature of the show was the releasing of homer pigeons with a message from the mayor of Stockton to the mayor of Oakland. In it the Stockton mayor said: "Stockton, at the present time, is holding one of the largest and best poultry shows ever held in the West, and as mayor I herewith extend to you and the citizens of Oakland a hearty and cordial invitation to come to our city and be our guest at this time."

CUT OUT Experimenting with Poultry Food

IT IS COSTLY, SLOW and FATAL. You gain nothing, lose much. When you mix your own feed you may have too much of a certain element, too little of another.

Buy Standard Food

The kind that makes strong, vigorous chicks. The kind that makes prolific layers.

All thoughtful poultrymen are now feeding

COULSON'S EGG FOOD MADE IN PETALUMA

It is recognized as the leader among egg foods. You will get better results by using Coulson's Egg Food than in any other way.

Clean up for the winter. To do this use Coulson's Cresoline. It is a wonderful exterminator of poultry parasites.

When the little chicks come along give them Coulson's Chick Food. It will save them. You can make more money in the number of chicks raised than the cost of the food and you will have strong, healthy chicks to start on the way to good layers.

Get the habit of buying Coulson's Foods and you will have no other.

HATCHING AND REARING TURKEYS BY ARTIFICIAL METHODS.

Notwithstanding the popularity of the turkey for human consumption and its consequent high price, the turkey producers have not been able to supply the demands of the market, due to the fact that turkeys are more subject to diseases than chickens and because the care of the young poults requires much patience on the part of the poultryman. Nevertheless, turkey raising returns a good profit to the producer when properly handled. In Farmers' Bulletin 200 the problems connected with raising turkeys have been outlined and treated more or less in detail.

The results obtained in the following experiment, conducted by the Washington station, on hatching and rearing turkeys by artificial methods should prove of value to those who desire information on the care of young poults.

Setting the Machine.

About the 1st of June we secured 102 turkey eggs of the Mammoth Bronze variety, which nicely filled the tray of our 150-hen-egg incubator. The machine had previously been warmed in the usual way, and at the time the eggs were placed in the tray the thermometer registered 102 degrees. The moisture pan, which was the same size as the tray and located beneath and 2 inches from the tray, was supplied with sand one-half inch in depth, which was thoroughly saturated with warm water. This sand was kept wet enough to show puddles of water on its surface at all times during incubation, by daily applications of water heated 100 degrees to 103 degrees F.

Turning the Eggs.

The eggs were turned over every 12 hours—morning and evening—beginning on the third day after they were placed in the tray and continued until the first sign of hatching, the pipping of the egg. The turning was very carefully done by first removing from the center of the tray about 1 dozen eggs, and then carefully rolling, with the hand, the remaining eggs toward the center of the tray, just enough to change the position of each egg. The eggs that had been removed were then placed in either end of the tray.

Temperature.

During the first week a temperature of 102 degrees was maintained, and afterwards 103 degrees, with but slight variations.

Testing.

On the tenth day the eggs were tested for fertility, 4 clear eggs being found, which, with the 3 that were cracked in transit, left for the machine just 95 eggs. Of these, 4 more were taken out, at the second testing, which occurred on the twentieth day. Thus we had 91 eggs that had stood the test.

Hatching.

The first evidence of hatching occurred on the evening of the twenty-seventh day, and by the evening of the twenty-eighth day the hatch was complete, resulting in 87 poults—4 had died in the shell. The day following the hatch the incubator door was left ajar about one-eighth of an inch, which was increased the second night to one-quarter of an inch. This was done to gradually harden the poults in their preparation for the hover.

Brooding.

During the afternoon of the second day after the hatch the poults were placed in a hover in the brooder house. The hover had been warmed to a temperature of 90 degrees. The poults appeared well and bright. All were placed in one hover, which proved to be a mistake, for the following morning there were several dead ones, caused by the young things deserting the hover and piling up, many of the underneath ones being smothered. About 30 were thus lost in a few hours.

When reared in the natural way and seeking to be hovered, the poults instinctively duck their heads and creep under the mother hen, while she assumes a settling position. The poults having thus assembled they become distributed among the feathers and under the wings of the hen. The warmth from the hen's body satisfies them. They become quiet. Deprived of the mother hen they bunch when, in their search for warmth, a scramble ensues, each poult making a desperate effort to get under the bunch. In the struggle they become surprisingly entangled, causing a condition that brings death to the weakest ones from smothering.

In order to save the remaining poults they were divided among three hovers, which ended the losses. These hovers were at first kept at about 90 degrees temperature for about a week, when they were reduced in temperature about 10 degrees weekly, until down to 70 degrees, which temperature was maintained until the poults were about six weeks of age, after which they do not require artificial heat. They were permitted to occupy the hovers for a couple of weeks longer, when the hovers were removed entirely. Care had been taken in keeping the hovers scrupulously clean by removing the dirt and supplying chaff. After removing the hovers, the poults were confined to their nursery rooms, each 4 by 12 feet, with an outside runway 4 by 20 feet. It was found necessary to provide additional runways as they rapidly outgrew those they were occupying. At four months of age they were given their liberty. They would not range, nor travel but a few rods from the place where they had been confined.

Feeding.

Unlike chickens, the young poults appeared not to know where to find their food. Teaching them to eat promised to become quite a problem. Failing to attract them to their feed in other ways, a few young chicks were placed in the nursery with each flock of poults. It was surprising how

aptly they took their first lessons from the chicks. Within one hour the problem was solved and all were feeding and drinking, with no further trouble. The first feed was stale bread, moistened with sweet milk, chopped onion tops, grit, and pure water. At this time the poults were nearly three days old. About three days later their bread feed was gradually changed to commercial chick feed, cooked milk curds, and lettuce. Three or four days later there was added to this feed dry bran and beef scraps—five parts bran to one part scraps—mixed and placed within their reach in shallow boxes, which was kept before them all the time until they became five months of age. A convenient hopper for this dry bran feeding we find to be a box 4 feet long, 6 inches wide, and 6 inches wide, and 6 inches deep, with a strip 2 inches wide, nailed lengthwise and in the middle along the top. Supply this hopper daily, just enough for a single day's feed—all that the poults will eat. Fresh green stuff, such as lettuce, kale, or cabbage, was fed liberally daily, morning, noon and evening; also sweet milk and fresh water. The drinking vessels were washed clean daily. A box of gravel and cracked shells and a dust bath were kept in their nursery. From the time they would pick up oats, corn, or wheat their grain ration consisted of equal parts of these grains, mixed and scattered in the runways three times daily, as much but no more than they would eat. We regard that the most surprising thing in connection with the feeding was the small quantity of these grains consumed, which was evidently due to the very liberal supply of milk and green stuff provided.

Preparing for Market.

Two weeks before these turkeys were to be marketed for the Christmas trade they were weighed separately, when one-half of the number were divided into lots of four each and placed in darkened pens, admitting the light only at feeding times, while the remaining one-half were confined in roomy roosting quarters, having a runway of 20 to 50 feet. These quarters were not darkened in any way. Both lots, in lieu of the mixed grain and dry bran feed, were fed three times daily of the following fattening ration—all they would eat—making the change gradually: 6 parts corn meal, 2 parts middlings, 2 parts beef scraps, by weight, and moistened with milk. The green feed was fed as before.

This experiment lasted two weeks. The birds that were confined in darkened pens made no gain whatever in weight, while those birds that had more liberty gained 2 pounds and 2½ pounds each. These birds were marketed when a little more than 5½ months of age, when the pullets weighed 13 and 14 pounds each, and the toms 17 to 19 pounds each, live weight.—Ex. Sta. Bul. 465.

SUCCESS WITH THE INCUBATOR.

The person to run the incubator is the first condition of its success. A good incubator requires attention twice a day. One person should give this attention, and must give it regularly and carefully.

The farmer's wife or some younger member of the family can often give more time and interest to this work than can the farmer.

The best location for an incubator is a cool, dry cellar. The next choice would be a room in the house away from the fire or from windows.

Drafts of air blowing on the machine are especially to be avoided. Not only do they affect the temperature directly, but cause the lamp to burn irregularly, and this may result in fire.

The size of incubators that can be profitably used will depend upon the number of hens kept for brooding purposes.

A final condition of success with an incubator is not due to the incubator at all, but to the ability to successfully rear chickens after they are hatched.

There is a prevailing notion that incubator chicks are weaker than hen hatched chicks. This, however, is not necessarily true. Many of the prize winners of our poultry shows, as well as the choicest market fowls, are hatched in incubators. The fault with incubator hatched chicks lies in the treatment after hatching.

WHITEWASH.

Into a tight box or barrel put five or six gallons of hot water in which has been dissolved four or five pounds of coarse ground salt. Into this put a pailful of the best lime obtainable. The large lumps should be broken into small pieces. Immediately cover the barrel and cover with a heavy weight in order to keep it in place when the lime is slaking, for the uplifting power of the boiling mass will be surprisingly great. After a few moments uncover and stir the mixture to the bottom with a long stick, then recover and keep closed for a day or two. When fully slaked the lime should be of the consistency of thick cream. When applied to hen houses or a fence, it should be thinned with water to a consistency of common paint. If properly slaked the lime will be smooth and free from lumps.

When applying the wash dip out a sufficient quantity in a pail and stir in a handful of cement. This will cause the wash to adhere firmly to the surface. It will be of dazzling whiteness and "lay on" like paint.

An excellent plan when whitewash is to be used about hen houses is to put in a liberal quantity of crude carbolic acid.—Mrs. Basley.

THE WEATHER BUREAU.

Secretary Wilson stated today that every important meteorological change that occurred in the United States during the year was forecasted by the weather bureau long in advance. Storm warnings to lake, seacoast, and West Indian stations and frost warnings for the sugar, trucking, tobacco, fruit, and cranberry regions were issued whenever conditions justified. These warnings were successful. Particular attention was given to the hurricanes of September and October, 1910, and a number of testimonials commending the work of the bureau in connection therewith were received. The warnings of the approach of cold waves resulted in the saving of growing crops and prevented injury to many shipments of perishable goods and to farm stock.

Owing to a large deficiency in the precipitation of the year over a considerable portion of the country, there was an absence of great floods, except in California, where, during February and March heavy winter snows and rains combined to cause floods, with resultant damage, estimated at $1,750,000. In July and October the smaller tributaries of the Ohio river were in flood as a result of heavy local rains. The damage to crops and other interests amounted to about $5,500,000.

It's the

Laying Hen

That makes Poultry Raising Profitable

There are certain Food Elements that are absolutely necessary to keep your hens healthy and productive. If a hen does not have the proper food and nourishment she cannot be expected to produce eggs

Successful Poultrymen use and recommend our Superior Foods

They find that the Poultry Foods **we manufacture** and sell are as important to their success as the chickens themselves, because a hen that won't lay is a useless expense.

Our Superior Poultry Foods include

Pure Blood Meal
Beef Blood and Bone
Cracklings
Pure Meat Meal
Ground Fresh Bone
Limo Grit
Animal and Willow Charcoal
Granulated Oyster Shells

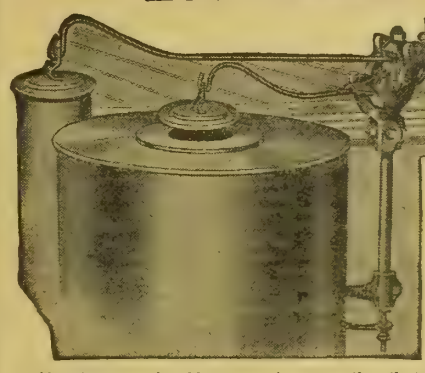
1912 Incubator Sensation

Lee's BEST Invention



regulates and adjusts, *automatically*, and in correct relation one to the other, *heat, moisture*, and *ventilation*. A great new principle discovered and applied in the

Mandy Lee Incubator

High heat must have low moisture. Low heat must have high moisture. The proportions of each are vital to the hatch. Thousands of hatches are ruined from no other cause than that the *proportions* of heat and moisture are wrong. The Mandy Lee is the only Incubator that applies this principle—the only one that measures the moisture accurately and automatically regulates the amount *according to the temperature*. If the heat from any cause, day or night, rises suddenly, don't worry, the hatch will not be spoiled, because it is *dry heat*. The *moisture* has been *decreased* as *heat increased*, and greater ventilation secured—*all automatically*. This is also the only incubator with *wide-open ventilation*, such as is used in poultry houses, which proved such a great success last year. You should acquire an accurate knowledge of our latest and greatest invention. Our book *shows* and *explains*. Plain, practical, authoritative. Write for free copy.

FARM LANDS FOR SALE.

The Best Bargain Yet—A good, well improved, money making farm of 56 acres, 2½ miles from Arroya Grande, Cal. A prosperous little town—no saloons. Five miles from Pizmo Beach, the finest beach in California. Free rural delivery. The house alone cost $2,000. Good barn and outbuildings. Fine roses. Walnuts and oak trees around house. Assorted berries and fruits. Plenty wood for fuel. Plenty of fine soft water. No irrigation required, consequently no danger of Bermuda grass or other foul weeds. Owner must have the money at once, hence the sacrifice. Price $6,500; $3,000 cash, balance two years, 8 per cent. Also an 80-acre tract of fine, level, loamy land, 50 acres of which is No. 1, in northeastern part of Santa Barbara County. Will grow alfalfa, vegetables, fruits, cotton, etc. No alkali or hardpan. Free timber 1½ miles away. Elevation 2,500 feet. No extremes of heat, cold or storms. Can be irrigated if necessary. $600 takes it. Same owner as above. Wm. T. Mantz, Maricopa, Cal.

For Sale—700 acres land, 42 miles of Los Angeles. Plenty of good well water for domestic use; some running water on the land, and I believe plenty of water can be obtained to irrigate all of the tillable land, about 500 acres; about 200 acres fenced. I will take $35 per acre, one-third cash. I have 29 cows and heifers and 18 other young cattle, including calves. I will sell a pick of 20 out of the 29 cows for $50 per head, or I will sell the 77 for an even $2000. I have other personal property, viz.: Bees, mules, pigs, chickens, and farm implements. J. E. Youngblood, Lang, Cal.

Citrus Orchard—56 acres, all under cultivation, 670 lemon trees, full bearing; 716 orange trees, full bearing; 200 lemon trees 2 years old, 250 orange trees 2 years old, 60 Tangerines, full bearing; 2 acres deciduous fruit of all kinds, berries and small fruit. Good house of 13 rooms, finished in hardwood, basement. Barn and other buildings, well and windmill. Well for irrigation costing when completed $1500. Palms and flowers. Lighted with acetylene gas. In fact, it is the best ranch in the valley. Over 2000 shares of water stock. Price $37,000. Terms. F. J. Conrad, The Hustler, West Grand Ave., Escondido, Cal.

For Sale—LINDSAY ORANGE LANDS.

Eleven days before Christmas the fourteen packing-houses of Lindsay sent out pay checks for the 1910 navel orange crop. Lindsay orange district had the holiday orange market all to themselves, and of course they sold at good profit.

Why not invest in some of this Lindsay orange land and get the benefit of rapidly advancing prices?

Ten acre tracts in Lindsay, $150 per acre, on easy terms.

Choice Tulare alfalfa lands, water in abundance; any size tracts, $50 per acre up.

KIOUS-WHANN REALTY CO.,
235 Mason Bldg., Los Angeles. A 4164.

For Sale—10 acre orange grove with 5000 boxes of fine fruit on trees. In one of our very best sections, 20 miles from Los Angeles. No frosts, no scale, no smut. Trees 14 years old and in perfect condition. Heavily fertilized last week. Better than 30 per cent annual dividends. Sacrificed by a widowed lady who cannot give it attention; $16,000. Clear $4000 under value. Otto Anderson, 800 West 47th St., Los Angeles, Cal.

For Sale—A 20-acre farm for $20 cash and $20 a month; possession now; $90 to $125 per acre; your crops pay for the land; rich, level land for alfalfa, oranges, almonds, grapes, cows, chickens; abundance of ditch water for irrigation for $1 an acre a year. Where else can you get this? In Oakdale Colony, near good town and railroad station. Climate delightful. T. Wiesendanger, 408 West Sixth Street, Los Angeles, Cal.

For Sale or Trade—80 acres land in Coachella Valley, Riverside Co., Cal. Fine sandy loam; 3½ miles from Indio; 2 wells, 20 H.P. Foos engine; no frost; fine for early vegetables, dates, cotton, etc. Will trade for rooming house, L. A. or Long Beach, or orange grove out from L. A., or what have you? Price $8000. Might assume. Write W. Spry, P. O. Box 25, Coachella, Cal.

170 Acres—¼ mile from R.R. station and school, $30 per acre. 100 acres in crop; more can be planted to trees or vines. Partly warm citrus soil or for winter gardening; some alfalfa land; well 50 feet deep, 10 feet across, water 8 feet from surface; all under fence; no other improvements. Terms $3000 cash, balance at 7 per cent; will not trade. Address C. T. Haney, Escondido, Cal.

1920 Acres Alfalfa Land—One of the best subdivision or dairy propositions in the Sacramento Valley. 1,000 acres level bottom loam soil, two cow sheds, 400 head capacity, horse barn for 60 head, 10 room ranch house, blacksmith shop, hog sheds, outbuildings, etc. Well fenced and cross fenced, many corrals. Three miles from railroad station in Butte Co. This is an absolute bargain. Price $50,000. Very easy terms. Apply owner, Paul Goodloe, 1049 Phelan Building, San Francisco.

Choice Orange Land, Exeter District—63 acres, 3 miles south of the town of Exeter, California, three-quarters of a mile from Southern Pacific railroad station, right in the foothills, leveled, water developed on it. Write for particulars. The Phalanx Company, 513 Chamber of Commerce, Los Angeles, Cal.

SUDDEN DISASTER AND CONSTANT DISEASE.

The nation has been shocked by another appalling disaster, this time in Pennsylvania. A dam, built across a narrow gap between two hills to hold back a vast volume of water, suddenly gave way. The flood poured down the valley, carrying death and destruction with it. About forty lives were lost in a few minutes. A wave of sympathy swept over the country. Red Cross physicians and nurses hastened to the scene. Food, clothing, hospital supplies and money poured into the death-swept valley. Special trains loaded with supplies and men started for the town almost as soon as the news of the disaster was received. The state of Pennsylvania and the entire nation, if necessary, stood ready to relieve suffering and to save life, without regard to the cost in labor or money. All this is right; nor should it be otherwise, says The Journal of the American Medical Association. Yet how strange that our sympathies should be aroused to immediate and purposeful action by the loss of forty lives in a sudden and unusual way, when we are callous and indifferent to the fate of thousands who die from preventable but familiar causes. A Johnstown flood, an Iroquois fire, a San Francisco earthquake, will convulse the world with horror, yet the death from preventable diseases of over 600,000 people in the United States each year excites little interest. The newspapers announce the Austin disaster with front page "stories" and enormous headlines, yet the United States Census report for 1908 (the last one available) shows that in that year in Pennsylvania alone, 2450 people died of typhoid, 1920 of diphtheria, 8703 of tuberculosis, and that 9026 infants under two years of age died of infantile diarrhea, a total mortality of 22,099 from only four preventable diseases in only one state. So accustomed are we to these enormous losses through familiar diseases, that we accept them as a matter of course and as the inevitable lot of mankind. Yet each of these diseases is as preventable as was the Austin flood.

LIABILITY OF COMMON CARRIERS.

As a general rule railroad companies and other common carriers are bound to transport all goods that are properly offered for that purpose, but any common carrier may lawfully refuse to accept goods for transportation if they are not properly prepared or packed for the purpose. However, if a common carrier does accept for transportation goods which are not properly conditioned, prepared or packed it thereby assumes the ordinary duties of a common carrier, and is bound to see that the condition and packing of the goods are such as to insure their safety in transit. If the carrier is neglectful of these duties the consequences of such neglect cannot be transferred to the shipper or owner of the property. Accepting a shipment for transportation of goods not properly prepared therefor, without qualification or application concerning the fitness of condition for that purpose, subjects the carrier to all the liabilities ordinarily attaching to shipments properly packed or prepared. Generally a common carrier is regarded in law as an insurer of the property carried, and the only way, aside from express contract, by which a common carrier can avoid liability for loss of, or injury to, goods carried by it is to show that such loss or injury was occasioned wholly by the act of God, or of the public enemy, and that no negligence of omission or commission concurred to produce the loss or injury.

A common carrier that undertakes to transport and deliver live animals is subject to the same responsibilities with respect thereto as in ordinary cases of goods received for transportation, except that it is not accountable for, and does not assume the risk of loss or injury to live animals, which arise from their nature and propensities, and which could not be prevented by due exercise of foresight, vigilance and care. To escape liability for loss or injury to live animals the burden of proof is on the carrier to show such loss or injury was occasioned by the act of God, or of a public enemy, or by reason of the nature and propensities of the animals themselves.—Wisconsin Farmer.

DOLLS AND ARTIFICIAL FLOWERS WHICH CHANGE COLOR.

The principal uses of cobalt in the United States are in making glass and pottery. A beautiful blue is given to glass by the oxide of cobalt. Sympathetic inks, according to a report of the United States Geological Survey, are made from cobalt acetate, chloride, and nitrate that are colored when heated or colorless when cold. This interesting phenomena is due to the change in color of the salts on the absorption of water. When dry they are blue and easily seen on paper; when damp they are pink; and when dilute, colorless. A puzzling application of this principle may be in a doll whose dress is blue in dry weather but changes to pink when subjected to dampness, as in wet weather or when the doll is held in the steam of a tea kettle. Artificial flowers are made to show the same effect.

WHERE FRUIT IS A LUXURY.

Fancy fruit is a luxury indeed at this season in Paris, according to reports of the prices paid by consumers at the choice fruit stores. Buyers seem willing to pay any price for what they want. Fancy cantaloupes sell as high as $5 each. Fancy large apples are reported selling at thirty cents each. Hothouse peaches and nectarines $1.60 each. These prices seem largely due to the extortion of the retailers, wholesale prices being not necessarily higher than in other countries, for fancy fruit.

"When I compare the two or three creditors that I have, with the millions and millions of people to whom I owe nothing, I wonder why in the world those fellows make such a confounded fuss about it."—Bill Nye.

Pomona Patent Pressure Gate

Simple in Construction
Cheap in Price
As Durable as Solid Iron
Absolutely Watertight When Closed

No Rubber or wooden facing to rot or wear out

Locking mechanism is protected against rust or clogging with sand or dirt.

THE LOCKING DEVICE is the simplest made, merely a tapering screw with split tapering nut socket. It locks the cover in any desired position or locks the faces, making an ABSOLUTELY WATER TIGHT JOINT.

TWO FOOT HANDLE FURNISHED WITH EVERY PRESSURE GATE FREE.

ALSO A FULL LINE OF CIRCULAR VALVES FOR ORCHARD AND ALFALFA IRRIGATION CARRIED IN STOCK.

For Sale—

Irrigated Alfalfa Land

Land with Water on It Now for

$27 an Acre

EASY TERMS

Where can you buy Irrigated Land for $27 an Acre . . . . ?

In the Great Yaqui Valley, where your neighbors are the most successful farmers of California, Washington, Idaho, Oregon and Canada.

The rush to Mexico is on. The American farmer is beginning to realize that the only CHEAP land—that is, GOOD LAND—left on the American continent today is in MEXICO. IT'S THE LAST CHANCE. And the American farmer is taking advantage of it.

We have less than 3000 ACRES of this land at this price, and it is going fast. Get it NOW while you can.

Land level as a floor—splendid irrigation system now in operation—railroad transportation — 15,000 acres now under cultivation, and American farmers behind the plows—wheat, barley, oats, corn, cotton, alfalfa, hogs.

Buy NOW—later on you'll pay more.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper, and sign full name and address. Unsigned communications receive no attention.

Registered Cows.

Will you please tell me in next Cultivator what letters behind a cow's name mean. I have not been in California very long. I come from Russia. I vote for first one time. I vote for you to have a vote for I think you good better know than a man like me. I most respectfully admire you, Dear Lady.—Subscriber, Parlier.

The above was sent to Mrs. Sherman. The inquirer is plainly a seeker for light and is using the Cultivator and its contributors to that end. We welcome him to California and believe he has the making of one of our best farmers. He has overcome his European prejudices enough to believe that a woman of Mrs. Sherman's type is qualified to vote and "the first one time I vote for you to have a vote." Mrs. Sherman answers his inquiry:

Letters behind a cow's name mean that she has been tested for butterfat officially and has a sworn to record made under the supervision of experiment station officials or some other officer appointed for the purpose.—M. E. S.

Is it not also possible that subscriber refers to the numbers following names of registered animals. If so, this means the numbers which accompany the animal's name in the register of the national association of the particular breed. If this does not give the information our subscriber desires, if he will come back, we will answer more fully.—Ed.

Weighing Olives.

Is it not advisable to weigh olives when preparing for pickling? In Mrs. Sherman's article on curing of olives no mention is made of the amount of fruit which the lye is supposed to cover. We have always used one pound of lye for 50 of fruit, sometimes needing to use a second and weaker solution.—Subscriber.

In pickling the olives we do not weigh the fruit as it cuts no figure if the solution is made according to formula and the olives covered completely. Are you using Greenbank or Hercules caustic soda? These run 97 per cent pure and are stronger than the common run of lye. If the olives are well stirred by drawing off some of the liquid and pouring it back again, this strength has never failed to take out the bitterness. I would not take the lye off until bitterness has gone. It will do no damage after it has neutralized the acid, but remain on the olives that are perfect without action, while acting on those that are not neutralized as yet. Do not forget the salt as it keeps down bacteria that in warm weather like this fall will do mischief very quickly. The use of salt makes the cutting, we think, a little slower than the same lye without the salt.—M. E. S.

Ration for Colt.

Am weaning six-months' old mule colt and do not wish to turn him on pasture. What would you advise feeding? Have good oat hay. Also have yearling which I am feeding oat hay and dry bran, but he does not seem to be doing well. What is the best feed for him?—G. C. R., Moorpark.

Young colts do better on alfalfa hay than on oat hay. I really think oat hay feed alone poor in quality of building up an animal. If I had no alfalfa hay and could not secure it reasonably in price, I would cut the oat hay up and moisten it and feed on it a little mill feed. This may be rolled barley four parts, one part middlings. Feed three or at least two small feeds of this daily. It is a mistake to feed once a day a growing animal, as they need it little and often. We feed the yearlings about a quart at a time. Half of that will be enough for the weanling.—M. E. S.

Grass Moth.

What is the name of the moth miller enclosed? It is a nuisance on October nights. The air is full of them. Is this the kind that destroys clothing?—Reader, Wasco.

This was referred to Prof. H. J. Quayle, and he replies that it "is one of the common grass moths; that is, the larva feeds in grass and alfalfa land, largely. It is not the clothes moth, since this species is very much smaller, measuring about one-half inch across the wings, but is of the same general color as the one enclosed. The species is not of very great economic importance, though they may occasionally appear in large numbers as seems to be the case at the present time in the vicinity of Wasco."

Devil Grass—Salt Grass.

Please tell me what the specimens are which I enclose.—Subscriber, Anaheim.

One of these is a straight case of Bermuda grass, more commonly called devil grass, one of the worst pests and yet fairly good pasture grass, and in the South used largely as a meadow grass. The other was submitted to a botanist and was declared to be syntherisma linearis, a salt grass which is closely allied to the ordinary crab grass and is also a pest in the orchard. It has been in California for some years.

Plowing Orchards.

What are the best months of the year for plowing lemon and orange trees? If certain months are better, why?—Subscriber, San Fernando.

The usual plowing time is February and March. If green manuring is to be followed the crop is then in the best condition to be turned under advantageously. Some prefer plowing after the first rains of fall and then giving clean culture instead of growing green manure crops between trees. Of course, it goes without saying that summer plowing should be dispensed with, for the reason that plowing means great loss of moisture, and during the heated summer months the loss would be greater than the trees would stand. Besides root disturbance during the strongest growth of the tree would not give satisfactory results. For that reason most people prefer to do the plowing at least two weeks prior to blooming time.

Overheated in Brooder.

I purchased incubator chickens hatched on September 1st. They do not grow any feathers on their heads. Over their eyes are blue spots. I have placed piece of bluestone in the drinking water. Tried carbolated vaseline on heads without results.—Subscriber, Los Angeles.

The chicks have either been overheated, which has made them sweat and so retard the feathering, or they are from immature stock. Do not give

H. K. Snow, Jr., Prop. Oxnard, Cal.

them bluestone in the water but feed them good nourishing food and give them plenty of milk to drink, grease the heads a very little with vaseline and give them lettuce to eat.—Mrs. A. B.

Chicken Pox—Roup.

One or two of my young turkeys have hard bunches around the wattles and even on them. One hen has swelling the size of a large thimble under one eye and there is pus in it. We have isolated her. Turkeys have free range, clean water, good shelter, milk, barley, grit and charcoal.—Subscriber, Calexico.

Your turkeys have chicken pox. Grease the spots with carbolated salve three times a week till cured. Cut the lump that has pus in and squeeze it gently out and swab out the place and paint it with iodine. You could use the same remedy without cutting on the other hen's lumps. Do not let the iodine run over the wattles as it will burn. You always have to handle iodine carefully. Usually one application will cure.—Mrs. A. B.

On Shares.

What are the usual terms for planting alfalfa and potatoes on shares? If alfalfa is planted, if owner furnishes good river bottom soil with abundance of water, what proportion of the crop should he have? When planting potatoes if A furnishes land what part of the crop or rent should he receive?—Subscriber, Lakeside.

It is impossible to answer such a question because of the fact that conditions vary so much, nearness to transportation, richness of soil; and other factors, so that each section would have to figure out its own system. Under the conditions given we presume rent would vary from one-fifth to one-third; perhaps with very rich land even more than one-third would go to the owner. Will some of our readers who have had experience write us?

Weevil.

I send perforated wheat and with it insects which are in my feedhouse. Think they came with wheat I bought. They do much damage. How can they be exterminated?—Subscriber, Napa.

The insects are good lusty weevil and doubtless are doing vast damage if in any large supply. They may be quickly eradicated by the use of carbon bisulphide. The infested house or room should be closed as tightly as possible by stuffing papers or cloths in every crack and getting the door ready to batten down as closely as possible. Then place the bisulphide in dishes on top of the wheat, using one pint to 1000 cu. ft. of space. Leave closed overnight. Do not have lantern or any light near when working with the bisulphide for it is highly inflammable and even explosive. The same caution must be followed when opening up the house after the fumigation. Room must be thoroughly aired before a light is brought in.

Seed Potatoes.

What kind of seed potatoes should one secure for early planting? What is the best way of storing until planting time so they will come up quickly?—Subscriber, Long Beach.

The variety depends upon your market. One of the old favorites is the Early Rose. The Early Ohio is also occasionally planted, and the Burbank is one of the best. As to storing, if kept in a dry, cool place that is all that is necessary. If kept in the dark they are less liable to sprout.

Pure Bred Jerseys.

Where is the nearest place to see pure-bred Jersey cows?—Subscriber, Los Angeles.

We regret that there are no Cultivator advertisers who are handling Jerseys near Los Angeles. We will endeavor to obtain for our subscriber the information desired and give it to him through the mail. We may mention the Whiting Jersey Stock Farm at Heber, Imperial County. Surely there is an opening for the breeder of pure-bred Jerseys to announce himself to Cultivator readers. Of course there are many such breeders up through the San Joaquin Valley.

Salt for Stock.

Is rock salt for live stock desirable, especially in the dairy?—John Jirku, Los Angeles.

It is perhaps well to have a piece of salt lying where stock may reach it, but we have seen a piece of salt left for nearly two years in the manger, and so far as we could determine, not diminish a particle. It is claimed that California hay supplies sufficient salt.

Poll Tax.

Is a person owning land compelled to pay poll tax?—Subscriber, Brawley.

If the person is so unfortunate as to be a male, he certainly has to pay his poll tax unless he is 60 years of age or older or is a member of a volunteer fire department or the militia. The state attorney general has ruled that notwithstanding woman has been granted the franchise, she is not compelled to pay the poll tax.

Biliousness.

I have some Barred Rocks which turn yellow around the eyes and comb. I am feeding Egyptian corn in the head and cooked barley as a mash. They are in green alfalfa. What would cause the yellow color?—Subscriber, Bakersfield.

Your hens are bilious. This usually comes from overfeeding with too starchy ration and too little exercise. Give a dose of fifteen grains of epsom salts or give the whole flock epsom salts in the drinking water for a week in the proportion of one tablespoonful to a gallon of water. Give more green food and less grain.—Mrs. A. B.

Salt Grass.

I send grass which is in my garden and getting worse all the time. Pull it and cut it off but it continues to spread. Some call it salt grass, some witch grass. I should think it might be wire grass, it is so tough.—Subscriber, Lakeside.

This is salt grass, distichlis maritima, or marsh spike grass, found near the coast on both sides of the continent and will thrive on ground even crusted with alkali. Miners have considered it a good indication of water. There is no royal road to the destruction of this pest. Salt in large quantities is sometimes used and distillate in exceptionally hot weather may be partially successful, but the best method of all is clean culture. If in alfalfa where clean culture is not possible practically the only method is to plow up the field and give a year or two to cultivation of some root crop.

Belgian Hares.

Please tell me where I can get practical information on the raising of Belgian hares?—Subscriber.

Write Caldwell Bros., Los Angeles, for "Book of Hares."

Possibly Cowpox.

What is the cause, and cure (if any) of the itching sores that come on some milkers' hands? Dry or wet milking affects the same, and washing the

San Dimas Citrus Nurseries
SAN DIMAS, CALIFORNIA

When writing advertisers, mention Cultivator.

cow's udder previous to milking does no good; there is no dog-fennel in our pasture; the cows never wade in mud and do not sleep in filth of any kind. Their teats sometimes get a little sore, but that does not seem to make any difference. The California Cultivator is O. K.—New Subscriber.

We cannot be sure from the description, but imagine the trouble may be cowpox, which is a form of contagious inflammation of the udder and does not spread from animal to animal except by the hands of the milkers. It sometimes attacks horses, the infection being carried presumably on the hands of milkers as they go to the horses. The only treatment is the healing of the sores, and as milking is one cause of their remaining, the greatest care must be observed to do this as gently as possible. Some cases are so bad that a milking tube is necessary. If there are any sores they should be washed frequently with one-half ounce hyposulphite of soda in a pint of water.

Bulletin 71.

An article appearing in a recent Cultivator referred to Bulletin 71 which treats of soil bacteriology. For the benefit of inquirers who have asked regarding securing it, we may say that by writing to the Editor and Chief, Division of Publications, Washington. D. C., and sending 15 cents, it may be secured.

A Selfsucking Cow.

To stop a cow from sucking her own milk, in a humane way, put a good leather halter on the cow as you would on a horse. Next procure a good sursingle, and put it on like a riding saddle. Put a ring on the sursingle so that it comes under the body of the cow. Connect the ring on the sursingle and the ring on the halter with a strong stick; just how long the stick should be a little experience will tell. The stick being between the legs will stop the cow from reaching her bag with her mouth. There is comparative freedom for the cow in this plan. —Wm. Young, Pasadena.

GROWING.

The Fresno Nursery Company is sending out announcement that Mr. Charles B. Harkness, formerly with the Fancher Creek people, has taken an interest in the Fresno Nurseries. With his twenty years of experience in this work the Fresno people feel they have a most valuable man in Mr. Harkness. Of course Mr. Frank H. Wilson and Mr. Charles A. Chambers will both remain with the concern. The old time slogan of "True to Name Nursery Stock" will remain the motto of the company.

Legal

Edw. L. Payne, attorney, 301-304 Douglas Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr Payne is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Rental of Land.

A leases to B a certain piece of land, rent to be paid quarterly, lease to expire Jan. 1, 1912. A sells land to C. B receives no notice of sale for two or three months; lease has never been changed or assigned to C. Whom shall B pay rent to and has C any claim on rent, or can C take possession of place before lease expires?—Subscriber, Butte County.

B should pay rent to C unless it is also claimed by A. In that case a suit to interplead the two claimants might be necessary. C cannot take possession of the place before the lease expires, unless he did not have any notice (actual or record) of the existence of the lease at the time he purchased.—E. L. P.

Recording Agreement.

If B buys a piece of property of A through agent and then A has a trust company act as a trustee, after purchase B finds he cannot get his agreement recorded; can B get his money back?—Subscriber, Redlands.

The question does not state why B cannot get his agreement recorded, and cannot be answered for that reason.—E. L. P.

Pastured Horse.

A puts horse to pasture on B's ranch at $1.50 per month. Horse bothers neighbor's alfalfa, so B catches horse and works him without notifying A. Is B entitled to collect pasture bill on horse.—Subscriber.

A has a right to setoff or counterclaim against B for the value of the horse's services.—E. L. P.

Acquiring Title.

A owns 20 acres of land for which he has a good title. 20 acres joining it he has used for several years and has enclosed within a fence. There being a mistake in the original survey the government has no record of the land. A pays tax to the county on said land. Can he acquire a title or hold the land by paying tax to the county for a certain number of years? If not, how can A acquire a title?—Reader.

A cannot acquire a title by paying taxes on government land. I suggest that A make inquiry of the Commissioner of General Land Office, Washington, D. C.—E. L. P.

Inheritance.

I wish you would publish in your paper a brief statement of the laws of inheritance in the state of California, especially as to what part of a husband's property goes to the wife on the death of the husband, and what part of the wife's property goes to the husband on the death of the wife. Also publish a simple form of will by which a husband or wife can leave all his or her property to his or her married partner. Is there any simple form of agreement by which in case of death of either husband or wife all of the property belonging to either or both will belong to the remaining partner. Where real estate is deeded to a man and his wife, both being named in the deed, and the words, with right of survivorship in the deed, does it give the surviving partner full ownership of all the interests of both, in case of the death of either?—Subscriber.

If the decedent leaves a surviving husband or wife, and only one child, or the lawful issue of one child, in equal shares to the surviving husband, or wife and child, or issue of such child. If the decedent leaves a surviving husband or wife, and more than one child living, or one child living and the lawful issue of one or more deceased children, one-third to the surviving husband or wife, and the remainder in equal shares to his children and to the lawful issue of any deceased child, but if there is no child of decedent living at his death, the remainder goes to all of his lineal descendants. If the decedent leaves no issue, the estate goes one-half to the surviving husband or wife, and the other half to the decedent's father and mother in equal shares, and if either is dead the whole of said half goes to the other. If the decedent leaves neither issue, father, mother, brother, sister, nor the children or grandchildren of a deceased brother or sister, the whole estate goes to the surviving spouse.

A simple form of will is:

"I hereby give all property of which I may die possessed, of every kind and description, and wheresoever situated, to....., and hereby nominate .....executor of this my last will and testament and hereby revoke all other wills by me made. There is no simple form of agreement by which the property of one spouse will belong to the other in case of death.

If the deed is otherwise properly drawn, the survivor would have full ownership of the property, but a court proceeding would have to be had in order to determine the death of the other partner.

Title.

Four acres of unimproved land was deeded to my wife shortly after our marriage. I built on it and planted orange trees; having sold a lot which I owned before our marriage, for $600, to assist in building, etc. My wife died, intestate, seventeen years ago. Our four children are now all of age. What is my title in this place? How could I proceed to sell; all the children consenting to sale?—Subscriber, Colton.

One-third of the property belongs to you, and two-thirds in equal shares belongs to the children. You should probate your wife's estate, and have the children deed their interests to you, which deed should be brought to the attention of the probate court in your probate proceedings, and in your petition for distribution, ask to have all of the estate distributed to you. That will make good title in you so that you can sell the property.—E. L. P.

To make a delectable lemon pie, add the pulp of a banana to the custard before turning into the paste-lined tin. Cover with a meringue when it comes from the oven.

ROEDING & WOOD NURSERY CO.

The Roeding & Wood Nursery Company transferred most of its Tulare County nursery interests to the La Habra Valley lands east of Whittier, in Los Angeles County, some months ago. The company is now installing a central distributing house in Los Angeles which will be headquarters. A new building is being constructed on a small tract of land at 1603 E. Washington St., and several thousand feet will be covered with lath houses for the receiving of citrus, tropical and ornamental stock grown by the company. This place will also be the principal distributing point for Southern California for the plants of the Fancher Creek Nursery Co. of Fresno. The present temporary office of the company is at 237 Franklin St., but Mr. Wood hopes to have the main office ready for his reception by December 1st.

WINTER FERTILIZING.

In the winter nitrates are formed in the soil to a less extent than in any other season; hence to encourage growth and the formation of strong fruit buds, some nitrate of soda should be used now and occasionally through the winter.

With suitable applications of superphosphates now, the nitrate will insure the formation of moderate amounts of available carbonate of lime, which is badly needed in many soils.

IF WE HAD BUT A DAY.

We should fill the hours with the sweetest things
If we had but a day,
We should drink alone at the purest springs
In our upward way;
We should love with a lifetime's love in an hour,
If the hours were few;
We should rest, not for dreams, but for fresher power
To be and do.

We should guide our wayward or wearied wills
By the clearest light;
We should keep our eyes on the heavenly hills
If they lay in sight;
We should trample the proud and the discontent
Beneath our feet;
We should take whatever a good God sent
With a trust complete.
We should waste no moments in weak regret
If the day were but one.
If what we remember and what we forget
Went out with the sun;
We should be from our clamorous selves set free
To work or to pray,
And to be what the Father would have us be,
If we had but a day.

—Christian at Work.

ON THE ROSEBUD.

Bessie looked down from her seat on the high freight wagon with mingled emotions. Here she was goddess of all that surrounded her, for beneath her and Jim Derk were all her worldly possessions, converted into lumber, nails and utensils with which to take up her abode upon the homestead. Jim had begun to feel a warm interest in this little "bunch of calico," as he designated Bessie, in spite of the fact that she was clad in a neat and stylish suit of blue cheviot. She was just a little different. He was accustomed to the ancient maiden type of "homesteadresses," of which there were many upon the Rosebud, but this girl was different. He had gazed at her as she alighted from the train the day before, and had beamed with satisfaction when she approached him and made arrangements with him to freight her and her possessions over the fifteen miles of prairie that separated her claim from the village of Brazos. She was a plucky little girl; he was sure of this, else how had she dared to come out into this unsettled country without any help or masculine protectors.

Jim was one of the easy going Westerners who had always been in the country. It had never occurred to him that the land might have a value; he had never used his homestead right.

"Land!" he was wont to say to his fellows of the old West. "Why, there's more land around here than you can shake a stick at. What good is it, anyway? It won't grow nothing but steers, and ten steers on a quarter at that." When the homesteaders began flocking in by the trainload he still maintained his contempt for the land, and a supreme contempt for the people who came to live on it fourteen months for the sake of obtaining a patent from the government for 160 acres.

"Them fellers' time," he would say, "sure can't be worth much. They come out here and plow up five acres and raise a little corn and potatoes, and loaf around fourteen months, and then pull out and go away with the deed to a half mile square of land in a country where a township ain't no more than a bagatelle." But he had found that he could make big money hauling lumber and building shacks for these people, and that accounted for his present occupation.

This particular morning, as he rode along with Bessie beside him, he came to a conclusion. Coming to a conclusion was no easy matter for Jim. His type of men are ever on the van of the drift of humanity, just because they find it so difficult to come to any definite conclusion to take root on any particular spot. But the conclusion that Jim arrived at did him credit this time. He made up his mind to file on the nearest claim he could get to Bessie's, and to assume the role of guardian angel, whether she liked it or not. When they arrived at the claim, Jim picketed his horses and fed them a liberal supply of oats, and proceeded to help himself enormously to the dainty picnic lunch that Bessie had prepared. She watched the cans of salmon, pork and beans, etc., disappear with something akin to awe.

In the afternoon Jim hastily put together the shack which would be Bessie's residence, and left, promising himself to be her nearest neighbor just as soon as he could get his foot in the land office.

That night Bessie slept with one eye open until early in the morning, when exhaustion overcame her fears, and she fell asleep, not to awaken until nearly noon. She immediately got up, and began to hustle around, putting her furniture in order. When she had finished, it occurred to her that she had not eaten anything since the night before and was nearly famished. So she prepared a light supper, and was terribly startled when she heard a heavy wagon drive up. She peeked out of her one window, and when she saw that Jim had returned she was very much elated, although surprised. He told her that he had filed on a claim half a mile down the creek, and intended to buid there that night. What Bessie's emotions were as she listened to this recital it is not necessary for us to know, but it is easy to imagine that they alternated between gratification and trepidation.

After supper he drove away with his load and began the erection of his shack. He slept in his wagon that night, keeping one hand at his belt, where he could reach his "Colt's" for instant use, as was his habit.

He was sleeping soundly, dreaming about that "neat little bunch of calico," when he thought that he was suffocating and that someone was trying to pull his feet away from him. He awoke from the nightmare to find that he had not altogether been dreaming, for an oozy smelling rag was laid over his mouth and nose, and someone had just succeeded in pulling taut a noose around his feet. He jerked the rag away from his mouth with his left hand and drew the revolver with his right, letting fly on the instant at the figure that had just straightened up after tying his feet. The thing leaped into the air and fell in a gruesome heap. After a few convulsive struggles it lay still.

Jim had no time to attend to this, though, for a second figure with re-

volver leveled came running up. Jim felt something hit him in the cheek and saw the wagon splintered where a bullet had crashed through the side. He rose on one elbow and shot twice, though he had no time to aim, for another bullet whistled through his sombrero. His second shot was followed by a groan and then came voluble curses. His bullet had evidently found a mark of some kind. He looked over the side of the wagon box to find the attacker hunting on the ground for his revolver which had been dropped when Jim's bullet went through his wrist. Jim covered him and told him to get up off the ground and throw up his hands. The badman rose and Jim told him to cut the rope that tied his feet.

When the two were close enough to recognize, both were dumfounded, for Jim recognized Tom Scranton, the crown leader of the gang of desperadoes that had a record of crime to answer for in nearly all counties of the reservation. Tom cut the rope with his left hand for his right dangled helplessly.

"What in the h—— are you made of, man?" said Scranton. "I put enough chloroform on that rag to put a regiment to sleep."

Jim realized that his troubles were far from finished, so he tied up Scranton and gagged him. Then he reloaded his revolver and jumped on one of his horses and made for Bessie's shack. He knew that Tom's gang worked in squads of four, so he expected to find two more engaged in robbing Bessie. His heart was pounding against his ribs as he leaned forward urging Pinto to his best speed. When a few rods from the house, he dismounted and crawled slowly to the shack. Standing up he could look in at the window. A dim light burned in the corner. As he had expected, Bessie lay on the cot with a cloth over her face. They had not bothered to tie her, depending on the chloroform to do its work. He realized that he must move carefully. Although his heart was almost turning summersets, his exterior manner was as cool as if his only thought was to drive his mustangs along the road as he did every day.

He drew both revolvers and crawled to the door which stood open a crack, the lock having been pried off. He opened the door quickly and strode in to find two men bent over Bessie's trunk in the corner.

"They say the gal had $500 on her," said Knutson, whom Jim recognized from his picture in the "Wanted" advertisement.

Jim covered them both with his revolvers. "Well, Ole," he said, "I guess this is one on you."

The men threw up their hands knowing that they had a better chance to beat the law than they had to escape Jim Derk's gun. Jim made Ole tie up his mate and then he tied Knutson himself. Having done this he was ready to give his attention to Bessie. He pulled the rag from her mouth and began such measures as he had heard of to resuscitate people who are drugged.

"If she is dead, you'll pay for this," he grated through his set teeth and the two men tied on the floor curled their lips in scorn, for they still had a chance and they were used to narrow escapes. It is not until real death approaches that these "bad men" lose their nerve.

While Jim worked a locket that Bessie wore by a small chain about her neck unsnapped and Jim saw the picture there. This was the greatest shock to Jim of all that eventful night, for the picture was the same as the one he had carried in all his wanderings, the picture of his mother. Then he recognized the resemblance between Bessie and the picture.

"My little sister," he breathed, "my little sister whom I never expected to see again, and now perhaps she is dead. O, you demons! I'll kill you both for this." He sat upon the cot and raised her head in his lap and stroked the soft brown hair. Great dry sobs shook Jim as he sat there. Even Olson was affected at this sight of the awful grief of a strong man.

Then Bessie opened her eyes, slowly as if arousing from a deep sleep. She was not entirely awake. She dreamed of the old days when her big brother had rocked her to sleep on his knee.

"Brother, brother Jim," she whispered.

"My own little sister," and Jim understood then why he had taken such an interest. The robbers on the floor were forgotten for the moment. At last Bessie did awake. No explanations were needed, for they both understood.—Farmer and Breeder.

CRUMBS OF COMFORT.

Conscience is harder than our enemies.

No swords cut so fiercely as an evil tongue.

Women are always better or worse than men.

Pleasure, however innocent, is criminal in excess.

He who has most of heart knows most of sorrow.

Religion is the best armor in the world, but the worst cloak.

Let us believe that love goes with us to the shore unknown.

The best sort of revenge is not to be like him who did the injury.

Nothing can wake the soul's strong instinct of another world like music.

Beauty is worse than wine; it intoxicates both the holder and the beholder.

In this topsy-turvy world it seems that all the heaviest wrongs get uppermost.

Man must be prepared for every event of life, for there is nothing that is durable.

There is in the heart of woman such a deep well of love that no age can freeze it.

There is a future left to all who have the virtue to repent and the energy to atone.

Our virtues and our children are the more to us the more we have had to suffer for them.

Society is like a large piece of frozen water, and skating well is the great art of social life.

To be deprived of the person we love is a happiness in comparison with living with one we hate.

In sickness we should not so much say we are getting better of our pain, as we are getting better for it.

We may prostrate ourselves in the dust for having committed a fault, but it is not best to remain there.

The slightest sorrow for sin is sufficient if it produces amendment, and the greatest is insufficient if it does not.

The tale-bearer and the tale-hearer should both be hanged up back to back, one by the tongue, the other by the ear.

To give pain is as much an offense against humanity as against good breeding, and surely it is as well to abstain from an action because it is sinful as because it is impolite.—Exchange.

HOMELY HINTS.

A few of the essentials, after the ironing table itself and the irons, are an iron stand, an iron holder with an asbestos lining, a bit of beeswax tied up in a piece of cheesecloth, a bowl of warm water with a sponge or a piece of soft linen, which may be used to dampen scallops and edgings which have become too dry to iron well, a piece of paper folded in several thicknesses, on which to test the heat of the iron and to wipe any black smirch from it. Take your clothes from the line as soon as possible after they are dry. They are likely to become too stiff if left out longer than necessary. Be especially careful to bring starched clothes in as soon as they are dry. When it is cold the freezing takes out the stiffness, and when the weather is damp the clothes become limp.

Carbonol is a coal tar product and if you add a dash of it to water used in cleaning, you will find that the water immediately becomes more effective in dissolving dirt and grease. As Carbonol will not hurt anything, it is a good idea to add it to the water anyway, whether you have a difficult cleaning job or not.

Milk will sour very quickly if put into dishes that have not been scalded.

It is advisable to have all bed linen and clothing from a sick room kept in boiling water for at least fifteen minutes before going to the laundry.

Stewed apples or pears or peaches covered with custard and meringue, put in oven to brown and served very cold, is a nice dessert.

Keep the range free from soot in all its parts, clearing all the flues of soot and dust that quickly accumulates, and regularly remove all slinkers that get fixed in the bars and inside the grate. A hot-air passage clogged up with soot will prevent the oven from baking well.—American Cultivator.

MUSTARD.

Two or three teaspoonfuls of ground mustard stirred into half a pint of water will act very promptly as an emetic, and it is easier to take than salt and water. Equal parts of ground mustard and flour or meal made into a paste with warm water and spread on a thin piece of muslin, with another piece of muslin laid over it, forms a good "mustard plaster." It is almost a specific for colic when applied for a few minutes over the "pit of the stomach." It acts as a counter irritant by drawing the blood to the surface; hence, in severe cases of croup, a small mustard plaster should be applied to the back of the child's neck. The same treatment will relieve many cases of headache. A mustard plasetr should be moved about over the spot to be acted upon, for if left in one place it is liable to blister. It acts as well when at a little distance from the affected part. A good substitute for mustard plasters is "mustard leaves." They may be obtained a dozen in a box. They are perfectly dry, and will keep for a long time. For use it is only necessary to dip one in a dish of water for a minute, and then apply it.—Ex.

ADDING INSULT TO INJURY.

First Hen: "Stopped laying?"

Second Hen: "Yes. They expect us to lift the mortgage on the auto that runs over us."—Harper's Bazar.

EXPLAINED.

"Katie," said Mike, "if ye're after listening tonight and hear an inaudible whisper, 'tis mesilf that's keepin' quiet."—Harper's Bazar.

ADHESIVE PLASTER.

Here is a discovery of mine which has been of great help to me, and it will doubtless interest housewives who have had the experience of paring large quantities of fruit for canning or drying, and as a result have had a very sore thumb from the tiny cuts made by the paring knife.

A few minutes before beginning to pare the fruit, take a small square of adhesive plaster, warm it and place on the center of the right thumb. This will not come off, even if it is necessary to wash the fruit, but when through paring moisten slightly with benzine or alcohol, and it can be easily removed.—A. L. M., in Ladies' World.

LEMON SYRUP.

For an excellent lemon syrup that may be kept on hand for emergency use pour three quarts of water over four pounds of granulated sugar, and let it stand, stirring occasionally, until the sugar is completely dissolved; then set over the fire and heat gradually until the boiling point is reached. Boil ten minutes; then add three pints of lemon juice, and strain. Turn the syrup into perfectly clean bottles; cork tightly, and keep in a cool place. For a plain lemonade dilute the syrup with ice or charged water to suit the taste.—Harper's Bazar.

SHOES.

I think new shoes the finest things in
all the whole wide world.
When Nurse has changed my frock
and made my hair look nice and
curled,
And buttoned up my shoes, I can't do
anything but look
Straight at my feet, and feel just like
the princess in the book.
And even if they pinch my toes, I
never seem to care;
I'd almost rather have them, for it
makes it true they're there.
If you could wave a wand and let me
have the things I'd choose,
I'd take a shiny, squeaky, pinchy pair
of brand-new shoes.
—October Woman's Home Companion.

HIS ECONOMY.

The children in the Blank family were taught habits of neatness at the table by being compelled to pay a fine of one cent for every spot they put on the tablecloth. One day Harold, a boy of seven years, was discovered rubbing the overhanging part of the cloth between his fingers, and, when taken to task for it, he said:

"Why, Mummy, I was just trying to rub two spots into one!"—October Woman's Home Companion.

It may not be generally known that we have, in a nickel five-cent piece of our coinage, a key to the tables of linear measures and of weights. The diameter of this coin is two centimeters, and its weight is five grammes. Five of them placed in a row will, of course, give the length of the decimeter, and two of them will weigh a decagramme. As the kiloliter is a cubic meter, the key to the measure of length is also the key to measures of capacity. Any person, therefore, who is fortunate enough to own a five-cent nickel, may carry in his pocket the entire metric system of weights and measures.

Johnnie—Pa, won't you please buy me a microbe to help me with my arithmetic?

Papa—What good will a microbe do you?

Johnnie—I just read in this paper that they multiply rapidly.—Philadelphia Bulletin.

Brightest, Strongest and Best

You need the most powerful and reliable light you can get when loading the wagon for market in the early morning.

Rayo lanterns are the most powerful and reliable lanterns on the market.

They do not flicker, but burn with a steady, brilliant light. They will not blow out. They are economical, because, besides being moderate in price, they give you the greatest light value for the oil they burn.

Rayo lanterns are made in numerous styles, sizes and finishes, to suit any use. Best material and workmanship. Simple in construction, yet reliable and strong.

All Rayo lanterns are equipped with selected Rayo globes—clear, red or green, as desired. Wicks inserted in burners, ready to light.

Hay.

We have received in San Francisco the past week 3,450 tons of hay, which is practically the same amount as came into the market during the preceding week. About one-half of this amount consisted of alfalfa from the river.

There is little hay moving now for export account, and it is expected that this trade will continue to take the usual supply necessary to fill these current orders.

Alfalfa has continued to arrive in large quantities. The season has been most favorable, and much more has been shipped in here than if weather conditions had been different. The market is quiet, although everything that has ben coming in has been taken care of satisfactorily.

The dominant feature of the week has been the statement of the Hay Association showing the stock on hand in the country warehouses tributary to this city as being only 161,750 tons. This is a remarkable showing when compared with the stock on hand on November 1, 1910, of 280,170 tons, making 118,420 tons less than a year ago. Everyone knew that this year's crop was short, but the immense shortage shown by these figures was hardly anticipated.

Now, realizing the above shortage it is generally thought will cause a much firmer tone to pervade the hay situation. The weather is bound to be an important factor.

We quote the wholesale prices in round lots on today's market as follows:

Fancy Wheat Hay	19.00@20.00
No. 1 Wheat or Wh & Oat	16.00@17.50
No. 2 Wheat or Wh & Oat	13.00@14.00

Deciduous Fruit Market

F. B. McKevitt, general manager of the California Fruit Distributors, reports:

Sacramento, November 11, 1911.

The following gives the number of cars of deciduous fruit shipped from all points in California for the week (seven days) ending Friday morning, November 10, 1911.

Pears—4½ cars. Occasional cars of the later varieties are still going forward, and as it is now reported that there are perhaps half a dozen left in the state, this shipment may be expected to continue in a small way for perhaps a week longer.

Grapes—566½ cars. The shipment of Tokays would have been almost entirely completed this week under normal conditions. Quite a heavy shower which prevailed in most sections of the state where this variety is grown on the 9th instant will probably prevent any further offerings of this variety, and the movement may be said to be closed. There are plenty of Cornichons and Emperors still on the vines. These varieties will be uninjured by the rain, and, barring further adverse conditions, shipment will probably continue through the greater part of the month.

Weather at this time is pleasant, but quite cool. Light frosts have formed several mornings. A hard one in the producing sections would put an end to shipments for the season.

Comparative statement of shipments November 4:

	1910.	1911.
Cherries	250½	216¼
Apricots	289¾	214½
Peaches	2,517¾	2,027
Plums	1,552½	1,366
Pears	2,561	2,308¼
Grapes	4,662½	5,739
Sundry	16	16½
Total	11,650	11,887¼

Citrus Fruit Market

LOS ANGELES, Nov. 15, 1911.

New Navels are being received well, but the quantity is very limited because of holding back all green stuff and only shipping the ripe. The prices are satisfactory, running $2.25 to $2.50 f. o. b. California. The few Valencias in hand will soon be cleaned up. Southern California is shipping no Navels, all the early stock being supplied from Tulare and Butte Counties.

Lemons are still declining somewhat, but prices received are about $4.00 to $4.50, with some exceptionally fine stock commanding $5.00. The extreme cold weather has tended to increase the consumption somewhat, and the decline is not so general as anticipated at this period of the year.

Shipments.

Shipments of oranges since Nov. 1, 66 cars; lemons, 170; total, 236. To same date last season: Oranges, 50 cars; lemons, 156; total, 206.

* * *

RIPENING THE DATE.

(Continued from Page 481.)

enormously here upon them; the untimely storms which cause the fruit to rot and sour; and the peculiarlities of American taste which must be known and satisfied in marketing the product. The active enemies of the palm have been brought under control for the most part; but the excessive waste of fruit due to insects, birds and untimely wet weather has remained a most serious drawback, as high as ninety per cent of the crop having been lost during unfavorable seasons. It is therefore fortunate, at this time, that we are ready to submit methods whereby this loss may be almost wholly saved."

"The methods of artificial date ripening developed here fall into two classes—those depending upon stimulation by chemicals at ordinary temperatures; and the incubation process, with variations, employing only heat and moisture. The chemical methods, in particular, and the scientific foundations of the subject in general have been worked out by Dr. Vinson. One of the most promising of the many substances employed by him in ripening experiments is nitrous ether, by the use of which Deglet Noor dates may be ripened inexpensively, and without extensive inversion of cane sugar."

"The incubation method first employed by Dr. Vinson, but laid aside by him for chemical processes, was, later, independently developed, amplified, and economically tested by Mr. Freeman, who studied the scientific rationale of the process and who ripened and marketed the first successful crop of Deglet Noor dates from the Tempe Cooperative Orchard by its means."

A GREAT SHOW COMING.

The poultry fanciers of Los Angeles are planning for "The Best Ever" at Fiesta Park, January 4-10, 1912. The committee has secured 25,000 feet floor space, and the cooping facilities are known to be of the very best. As a special drawing card, seven specialty judges will place the awards. They are: William F. Brace, Victor, New York; William Purdy, Ferry, Washington; Ben F. Woodhull, Stockton; H. W. Gunston, Havilah; George W. Masterson, Duarte; E. E. Emerson, Los Angeles; R. V. Moore, Oakland. Of course there will be the usual cash premiums, silver cups, regular and special club ribbons on poultry and pigeons, water fowl, turkeys, etc. The secretary is Joseph E. Davis, R. D. 11, Box 48, Los Angeles.

We have word from Mr. Davis, Secretary of the Fanciers Club of San Diego, that preparations are already under way for the next annual, which will be held January 12-18. In connection with this may be held the exhibition of the San Diego Pigeon and Pet Stock Club, which was to have been held November 28-December 2, which dates have been cancelled.

The San Diego boys have the reputation for pulling off a fine little show, and some magnificent birds will be on exhibition at that time.

"Where IS that lantern?" "Who on earth has got that lantern?"

How many times have you heard exclamations of this sort, while some one was groping angrily around in the dark—possibly you were that some one yourself. Have you ever thought how much time and energy and temper is lost through just such vexatious little delays as can be caused by a missing lantern?

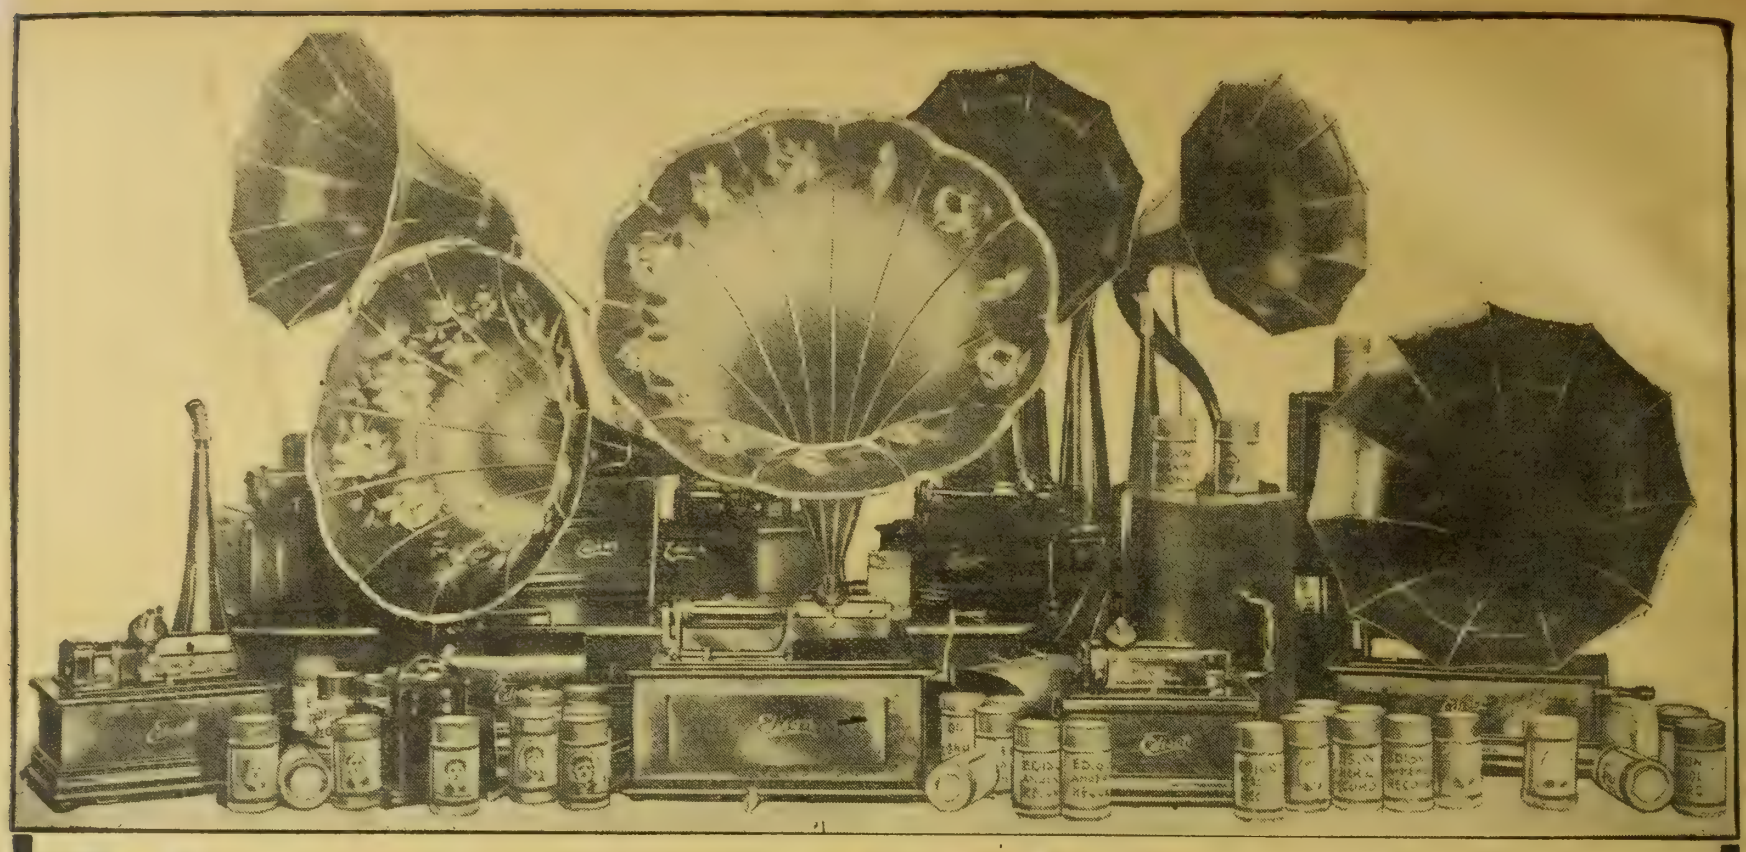
A lantern is one of those apparently insignificant and unimportant things you never think of at all—until the minute comes when you need it. It is wonderful how its importance grows then. A man is seldom more helpless than in the dark. Without light he is pretty nearly useless to himself and to everyone else.

Here is one economy that every householder or farmer should put into effect right away, supposing it does not already prevail. There should always be enough lanterns to go around—enough lanterns to meet all the different requirements of the place—a lantern for every purpose—one for every man on the place, if need be.

Think of the convenience of having a lantern always ready to your hand wherever you are likely to need it—for the front gate or the yard, in the kitchen or the barn, in the cellar or the stable. It is a mistake to suppose it really involves extra expense. The lanterns do not come in for half so much knocking and rough wear when each has its proper place and use. They last far longer. You are not always finding it necessary to buy a new lantern.

Among the very best lanterns made are the famous Rayo lanterns. These are manufactured especially for the Standard Oil Company. The best experts obtainable have been working for it for years elaborating and perfecting oil-consuming devices.

Rayo lanterns are specially suitable for farm use. They are made in numerous styles, sizes and finishes, to suit every use to which a lantern is put. Full particulars, with illustrated circulars, etc., are sent post-paid on application to any agency of the Standard Oil Company.



Your Choice
OF ANY OF THESE EDISONS

FREE

Yes, FREE Shipped positively and absolutely free. You do not have to pay us a single penny either now or later. We don't ask you to keep the phonograph—we just ask you to accept it as a free loan. We do not even ask you for any deposit or any guarantee, not even any C. O. D. payment to us. All we ask is that you tell us **which** of the magnificent Edison outfits you prefer so that we can send that one to you on this free loan offer.

Just Take Your Choice

You Don't Have to Buy Anything

Get any of the outfits shown above—your choice of records, too. **Simply get the phonograph and the records and use them free just as though they were your own.** Entertain yourself, your family and your friends, too, if you wish, with everything, from the catchiest, newest popular songs, side-splitting minstrels and vaudeville monologues to the famous grand operas, **Amberola** and other records sung by the world's greatest artists. Hear all this to perfection on the Edison Phonograph. After you have had all this entertainment absolutely free, then you may simply send the outfit right back **at our expense.** Now if one of your friends wishes to get such an outfit tell him that he can get the rock-bottom price, on easy payments, too; even as low as **$2.00 a month without interest.** But that's not what we ask of you. We just want to send you your choice of the latest style Edison Phonograph **free**—your choice of records, too, **all free**—then we'll convince you of the magnificent superiority of the new style Edison. It will cost us a little in express charges to get the phonograph back from you—that is true—but we'll feel amply repaid for that, knowing that we have made you a friend and a walking advertisement of the new style Edison Phonograph.

FREE COUPON

Send Coupon for New Edison Books FREE Today

Get our handsome Free Edison Catalog and list of over 1500 records so you can select just the machine and the songs, recitations, etc., you want to hear on this ultra generous offer. Remember, there is absolutely **no obligation** on your part at all. All you need to do is to return the outfit at our expense when you are through with it. If you enjoy good music, and the finest and most varied entertainment that it is possible to imagine, or if you want to give your family and friends a treat, such as they could not possibly get through any other means, then you should certainly send the Free Coupon to-day. Don't wait—your name and address on a postal will do, but the coupon is handier. No letter necessary. Be certain to write while the offer lasts. Better write to-day.

Arnott Buggies

Splendid styles, well finished and made of the best material. Made specially to our order BY THE LARGEST VEHICLE FACTORY IN THE WORLD.

Superior to Any

The fact that ARNOTT & COMPANY sell more vehicles than any house in the Southwest makes it easy to select the best values at prices that permit us to sell you a better vehicle for less money than you can get elsewhere. Our orders are keenly sought after by the best builders.

Fully Warranted

Every job we sell, regardless of price, is fully warranted for one year from the date it leaves our warehouse. This warranty is fully lived up to.

Good Values--Lower Prices

We assert positively that we give better values, styles and finish than can be bought elsewhere for more money. We have the exclusive sale of the celebrated ROUND CORNER ONE PIECE BODY. Write for large fully illustrated catalogue, sent free on request. A copy of this catalogue (80 pages) will save you money, regardless of where you buy.

Merced Colony

NO. 2

CALIFORNIA FARMERS are buying alfalfa land in Merced Colony No. 2. A large number have already bought and are now improving their places. Long experience with California soils has made these men keen judges of land. They know good land when they see it. That is why they are buying in MERCED COLONY NO. 2.

This land is in Merced County, in the San Joaquin Valley. It is all irrigated. Sold on very easy terms. Call or write today.

Alamo Gas Engine

You did not buy an ***Alamo*** last year because you thought the price too high. You can buy it now, for the price has been reduced.

THERE IS NO BETTER ENGINE MADE

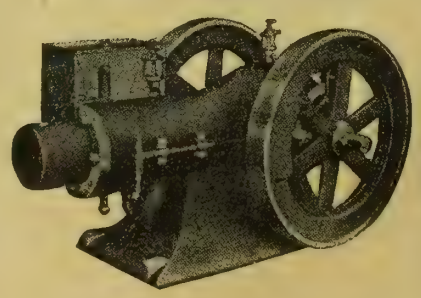
——ADDRESS——

Bailie & Brandt Co.

943-945 North Main Street
LOS ANGELES CALIFORNIA

Simplicity—Economy—Efficiency

NO ELECTRICITY—NO CARBURETOR



Not in competition with other engines. In a field to itself.

WHY?

What's a goose-quill got to argue about with a fountain pen, only that it one day "wuz all there wuz." Now, it's different. Look closely at the cut and note the absence of cams, yokes, gears, batteries, carburetors and mixing devices, and other complicated parts to get out of order. Unbelievable? Will an engine run on kerosene or distillate, for less than any other engine on the market, forward or backward, and at less expense, and without batteries, carburetor, and so simple that a boy can operate it?

We don't ask you to buy an engine from this advertisement or from any correspondence or representations that we may make; we ask investigation.

We want you to see our engine in operation, let the engine show for itself and when anyone "just chirps" engine in your hearing, we want to have you tell them about the engine YOU SAW, and we leave it to you as to the engine you buy. Demonstrations daily. Free circulars. Write today.

What Australia is Doing for Its Settlers

From a Letter by Elwood Mead of the British Columbia River and Water Supply Commission. The Letter Was Written to Edward Berwick and by Him Supplied to Cultivator Readers

The following letter, received by Edward Berwick, of Pacific Grove, from Elwood Mead, of the British Columbia River and Water Supply Commission, is very interesting, as it contains a great deal of valuable information:

"Through the courtesy of the Lands and Agricultural Departments I am sending you considerable information in reply to your inquiry as to how Victoria helps farmers to get land and make the best use of it.

"With the disappearance of public land in America something will have to be done to make private lands available for men of small means. If America is to continue to be the land of opportunity it must provide before long for the state resumption of private land, and it is along these lines that more can be learned here than from the lands resumption acts of Great Britain, although the greater part of Australia is as yet public land. You will learn, however, from the reports and pamphlets of the Closer Settlement Board that a large settlement on resumed land is taking place in the vicinity of cities and towns. This land, formerly used for pastoral purposes and grain growing, is being cut up into smaller holdings and used to grow higher priced crops. Nearly all the men who are taking advantage of this have very little capital. As a rule about enough to buy their furniture, their teams and tools, and they could not hope to obtain a home of their own were it not for the aid the state extends. But when the state gives 31½ years to pay for the land, and is considering giving 45 years, and only charges 4 per cent interest on deferred payments, any man who hungers for a farm can secure it, especially when the state builds a house on the land, and in some cases fences it and plants part of the crops, and many men whose only capital is industry and thrift are getting homes in this way. In our irrigated closer settlement areas we placed 600 families last season, many of them coming 12,000 miles. To help these men secure early returns the state plowed and planted about 3,000 acres, has an expert cattle buyer attending sales in three states to get milk cows cheap, and is now arranging to give these settlers the use of blooded stock for breeding purposes at nominal fees.

"The state has built a sugar factory, which was operated this year with satisfactory results by a Californian, Mr. Dyer; and it has bought one estate of 8,000 acres and another about half as large, and is cutting these up into 40-acre blocks to sell to sugar beet growers. The state is now considering the erection of a canning factory in one of the Closer Settlement Irrigation areas in order to provide a reliable market for the surplus products.

"No doubt to many Californians this seems a dangerous encroachment on private enterprise. Experience shows it is simply substituting a wise use of public agencies for the common good for the predatory American land enterprises which too often exploit the settlers from other states. How far this can go without destroying enterprise and initiative it is difficult to say, but so far it has not had that effect here; on the contrary, while it may prevent the establishment of a few privately owned factories, it has not interfered with the work of land boomers subdividing real estate for their individual profit; these men deal with the men who can pay cash. The state Closer Settlement agencies deal chiefly with men without capital, and are thus stimulating thrift, industry and enterprise on the part of scores of poor men who under private and speculative development would have to continue as wage earners, because private enterprise could not or would not give them the long time for payment and the financial and other assistance at the outset which they must have to succeed.

"The state has been driven into many industrial undertakings to protect the small producer from the clutch of private monopoly, which would without state interference have been more absolute and exacting than in America. And this will compel a continuous expansion of state industrial undertakings, as the state is engaged in a personal warfare with monopolistic combinations in restraint of trade. The manufacture of cane sugar is in the hands of private capital, which is a monopoly and which buys cane at a low price and sells sugar at a high price, just as it does in America. The railways are all state owned. Travel on land here is free from discrimination or favoritism, except where caused by state jealousies, but the vessels which carry products on the seas are privately owned, and nearly all are in a combine which fixes and maintains rates and favors some shippers at the expense of others. The minister of agriculture recently ascertained that practically all the refrigerated space of the fast mail steamers to Europe allotted to the transport of fresh fruits has been contracted for two years in advance by a trust. In America the Sherman act would be invoked, in four or five years you would possibly get a decree abolishing the trust, which would shed one skin and grow another, and go on with its business exactly as before, but here the shipping combine will either contract that space to the state, which had agreed to buy it on behalf of the growers, or there will be a state owned line of steamers. The existence of a butter ring a few years ago caused the state to fix for steamship lines the prices at which butter is carried to Europe, and the result is that it is carried to London, a distance of 12,000 miles, for one cent a pound. The establishment of a beef trust controlling the foreign refrigerated trade in meat led to the building of a government cold storage warehouse, which has not driven out private enterprise, but it has compelled it to behave. Only two years ago Victoria was dependent on privately owned mines for the coal which operates its state railways, then there was a strike and a combination which boosted prices, and now this state owns and operates a coal mine. Every privately owned mine still does business, but it does not raise prices.

"It is, of course, an unsettled question how far this movement can be extended with safety, but I do not know of any movement in the direction of public ownership which this state has made that has not been justified by results. I came here a believer in state regulation of privately owned railways, I am wholly converted to state ownership of railways, and I am convinced that your attempted private regulation in America is a delusion which will be abandoned in time. You will either become a nation ruled industrially by a few men of immense wealth, with the great body of the people wage earners, or transport will pass wholly under public control. It is the only way that the small independent industry can have any hope of a stable and prosperous existence.

"These are some matters outside of your industry which in its narrow interpretation is answered by the documents sent by the Lands and Agricultural Departments. But it is these measures rather than the one you are familiar with which have made the farmer of this country so universally prosperous and which give good prices and stable markets notwithstanding the distance which separates this continent from the great buying centers of the world."

Citrus and Tropical Fruits

ORANGE AND LEMON CROPS OF CALIFORNIA AND FLORIDA.

A preliminary statement giving statistics of the orange and lemon crops in California and Florida, the two principal states of production, as reported for the Thirteenth United States Census, was issued today by Director Durand of the Bureau of the Census of the Department of Commerce and Labor. It includes a summary giving the number of trees, of both kinds, of bearing and non-bearing age, on farms on April 15, 1910, together with the number of boxes produced and the value thereof in 1909. It was prepared under the direction of Dr. LeGrand Powers, chief statistician for agriculture, Bureau of the Census. The figures are subject to such revision as may be necessary after a further examination of the original reports.

The Census Bureau calls attention to the fact that the number of trees reported in 1910 is not altogether comparable with the figures reported in 1900. In the latter year the trees reported as of bearing age undoubtedly included a considerable number not of bearing age. In the census of 1910 the difficulty was eliminated, as both the number of bearing age and those not of bearing age were called for by the schedule. Moreover, the orange and lemon growers of Florida had not in 1900 recovered from the damage by frost inflicted a few years earlier, resulting in a crop less than half as great as in 1890.

Statement showing number of oranges and lemon trees of bearing and of non-bearing age, on farms, April 15, 1910, and number of boxes of oranges and lemons produced in 1909, together with the value thereof—1910.

	California	Florida
Oranges.		
Number of trees of bearing age, Nov. 15, 1910	6,615,929	2,751,118
Number of trees of non-bearing age, Nov. 15, 1910	2,093,101	1,097,896
Number of boxes produced, 1909	14,436,424	4,852,967
Value, 1909	$12,952,291	$4,304,987
Lemons.		
Number of trees of bearing age, Nov. 15, 1910	927,130	11,740
Number of trees of non-bearing age, Nov. 15, 1910	376,859	7,329
Number of boxes produced, 1909	2,715,974	12,367
Value, 1909	$ 2,925,759	$ 13,753

California Orange Crop, 1909 and 1899.

The orange crop of California made a gain of 145.4 per cent during the decade between 1899 and 1909, increasing from 5,882,000 boxes in 1899 to 14,436,000 boxes in 1909. During the same period of time the number of trees of bearing age increased from 5,649,000 to 6,616,000, or 17.1 per cent. There were also in 1910, 2,093,000 trees of non-bearing age. In 1909 the average product per tree was 2.2 boxes. With respect to quantity of fruit San Bernardino County rose from third rank in 1899 to first in 1909. In 1899 Los Angeles County ranked first, and Riverside County, second.

The value of the oranges produced in 1909 was $12,952,000, an average of $0.90 per box.

California Lemon Crop, 1909 and 1899.

The lemon crop increased from 874,000 boxes in 1899 to 2,716,000 boxes in 1909, a gain of 1,842,000 boxes, or 210.7 per cent, although for the same period the reported number of trees of bearing age decreased from 1,493,000 to 927,000, or 38 per cent. The number of trees of non-bearing age in 1910 was 377,000. The number of boxes per tree in 1909 was 2.9; in 1899 it was just under three-fifths of one box. The value in 1909 was $2,926,000, or $1.08 per box.

Florida Orange Crop, 1909 and 1899.

The production of oranges in Florida increased from 273,000 boxes in 1899 to 4,853,000 boxes in 1909, a sixteen-fold gain. The number of trees of bearing age was 2,553,000 in 1900, and 2,751,000 in 1910, an increase of 7.8 per cent. The number of trees of non-bearing age in 1910 was 1,098,000. The value in 1909 was $4,305,000 or $1.11 per box.

Florida Lemon Crop, 1909 and 1899.

The lemon crop increased from 2359 boxes in 1899 to 12,367 boxes in 1909, a gain of 10,008 boxes, a fourfold gain. The number of trees of bearing age reported decreased from 22,691 in 1900 to 11,740 in 1910, or almost one-half. The number of trees of non-bearing age in 1910 was 7329. The value of the lemon crop in 1909 was $13,753.

GIRDLING TO INCREASE SIZE OF OLIVES.

Mr. Alxander Craig, of Fair Oaks, Sacramento County, sends the following novel method of increasing the size of his olives. A few of the fruits are sent, and they are surely monsters for Missions. They will almost pass for Sevillanos as to size. But as to the method, Mr. Craig writes:

"I grow three kinds of olives here—the Manzanillo, used mostly for pickles and worth from $80 to $100 a ton; the Nevadillo, used entirely for oil making and bringing in only $40 a ton, and the Mission, which are meant for pickles and said to make the very best pickles, but which in my orchard seldom grow large enough, and so have to be used mostly for oil.

"To remedy this defect in the Mission trees I have tried an experiment this season which promises a fair measure of success. I let the trees go unpruned, and then, after the fruit was well set, about midsummer, I girdled such of the branhces as I thought might be profitably pruned off next season. That is, I removed a strip of bark all around the branch about a quarter to half an inch wide. The result is that the olives on these branches grow very large and ought to make the finest pick[illegible]—in fact, they should be in a class all by themselves. I send you a few samples under separate cover, which fairly represent the crop on the girdled branches.

"In this way one can make sure that part of the rcop ev[illegible]estigatic will be abundantly large for pickles, and if the rest should be too small they can always be used for oil."

The American Dredging Company of New York has the contract for dredging the canal from the Laguna Dam across the Colorado above Yuma to the syphon which will carry the waters to the Arizona side.

GREAT PHOSPHATE DEPOSITS.

When the great coal deposits of Pennsylvania, West Virginia, and other states of the Appalachian region were being formed, many millions of years ago, in what the geologists term the Carboniferous age, there was also being accumulated in the Rocky Mountain region enormous mineral deposits which are of a widely different character but which may nevertheless play an economic part in the industrial development of the United States comparable even to that of coal. These are the phosphate deposits of Wyoming, Utah, Idaho and Montana, which are now known to contain hundreds of millions of tons of phosphate rock, constituting a most important artificial fertilizer. Until recently it had been generally assumed that the phosphate deposits of South Carolina, Florida and Tennessee afforded an "inexhaustible" supply, but recent estimates by the United States Geological Survey show that at the present rate of increase in phosphate mining these eastern deposits are likely to be exhausted within a generation.

Greatest Known.

The discovery of the western phosphate beds therefore constituted a most important find, and though the first reconnaissance of these deposits by the Geological Survey showed their considerable extent, the more detailed study and exploration, with additional discoveries made by the survey during the last three years, have shown that the field is probably the greatest in the world. Recent geologic study of the phosphate-bearing strata indicate the probably still greater extension of the phosphate area. The northernmost portion of the beds first discovered was in Wyoming, but an outcrop of the same character and in the same geologic formation was found last year in Montana, some 160 miles farther north, so that Survey geologists believe that workable phosphate beds may be found in many other places.

The Geological Survey has just published a bulletin embracing three reports on western phosphate fields, one covering a portion of the Idaho phosphate reserve, by R. W. Richards and G R. Mansfield, another on rock phosphate near Melrose, Mont., by Hoyt S. Gale, and a third being a reconnaissance report on the phosphate deposits in western Montana, by Eliot Blackwelder. The report by Messrs. Richards and Mansfield includes a detailed description of the Idaho field, the investigations having been made by townships, the outcrops examined, and the tonnage of high-grade phosphate rock estimated. The result is highly gratifying. Tonnage estimates were made of the phosphate rock in nine townships, and in no township was there found to be less than approximately 60,000,000 tons of high-grade phosphate rock, containing for the most part from 50 to 82 per cent phosphoric acid. Phosphate rock containing 60 to 65 per cent phosphoric acid is generally considered high grade.

Nearly Three Hundred Million Tons.

One of the townships examined contains an estimated 293,000,000 tons of phosphate rock, the net results of the Survey's work showing an approximate tonnage of 2,500,000,000 long tons with 70 per cent phosphoric acid. Nor does this include the tonnage of the Montana phosphate withdrawals, which aggregate nearly 34,000 acres.

Mr. Gale's report is a brief description of his discovery last year of the Montana deposits near Melrose, withdrawals of which were immediately made by the president. The Survey's tests of a number of samples collected by Mr. Gale show the rock to be high grade, approximately equivalent to 75 per cent of phosphoric acid. The thickest beds are 6 or 8 feet in thickness. A 6-foot bed would contain approximately 21,000 long tons to the acre.

"One of the most important considerations in connection with the discovery of phosphate rock in western Montana," says Mr. Gale, "is its significance as to the probable extent of the western phosphate fields, for it now appears probable that similar deposits may extend over a large part of western Montana. Their nearness

(Continued on Page 541.)

CITRUS SHIPMENTS.

It is interesting to note the rapid growth of California's greatest fruit industry during the past few years. It is a wonderful proof of the growing popularity of the orange and lemon.

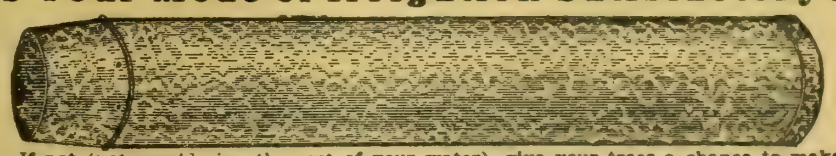
Is Your Mode of Irrigation Satisfactory?



If not (not considering the cost of your water), give your trees a chance to make good by giving your orchard the proper amount of water all over same, and not three-quarters of your water supply within forty feet of your head flume.

The surface irrigating pipe we manufacture will remove this obstacle—will cut your water bill—is more convenient to use and will last a life time.

Write us, stating your requirements and we will cheerfully furnish you with prices and information desired.

We also manufacture Ells, Tees and Gates for this special pipe and are in a position to manufacture any special fittings you may require.

THE AMES IRVIN COMPANY **Corner Eighth and Irwin Streets, San Francisco, California**

KIRKMAN NURSERIES

TREES THAT GROW AND BEAR TRUE TO NAME

Wholesale Growers of First-Class Nursery Stock

A fine lot of Peach, Plum, Pear, Apple, Apricot, Fig, and other deciduous fruit and shade trees.

Also a million rooted grape vines; a few thousand nice Orange and Lemon trees, and a lot of No. 1 Eucalyptus.

Shipments made from Main Nursery at Fresno, or from branch at Sacramento (Corner 15th and K Sts.)

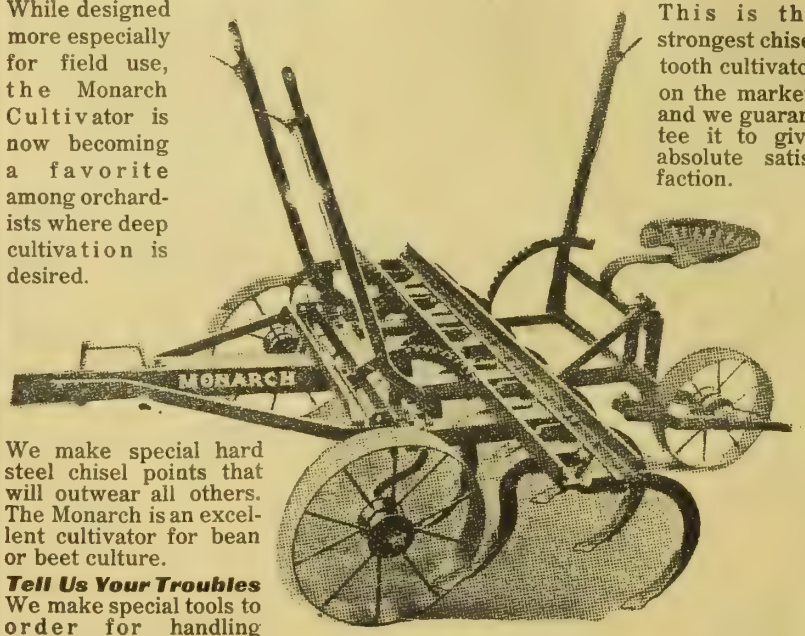
Monarch Cultivator

While designed more especially for field use, the Monarch Cultivator is now becoming a favorite among orchardists where deep cultivation is desired.



This is the strongest chisel tooth cultivator on the market, and we guarantee it to give absolute satisfaction.

We make special hard steel chisel points that will outwear all others. The Monarch is an excellent cultivator for bean or beet culture.

Deciduous Fruit Culture

THINNING APPLES.

We must spray thoroughly to prevent damage from insects and fungous diseases, and make the applications at the proper times, using the right kind of medicine for the right insect or disease, using to prevent injury, not to cure a disease or wound, although it may be a curative to a slight extent. But, remember that the bird with a broken wing never soared so high again, nor will the apple with a sting or fungus ever be so shapely or attractive again.

The chances are that there will be plenty on the tree anyway without it and if it does not fall of its own accord, or be crowded off by the fittest, it would be better to trim it off to give the other good ones an opportunity to appropriate the nutriment the deformed or cull would get, and it would make good by picking time and the crop would be handled in much less time, time saved in picking, in sorting and grading; in fact, time saved wherever any of it is handled between the picking and the consumption of it. The quality is better also, the fruit firmer in many cases, and keeps better, and the trees remain in a more healthy condition and are apt to bear more regularly and last longer, and the cost of thinning need not be great.

Thinning can be done for only a few cents per barrel, usually about five cents, but with very full trees it may need ten cents' worth of labor. Still at that the culls will be out of the race and the net returns far greater. Let us do more thinning, like some of the western growers have done, or go them one better and grow as good apples as they do on cheaper land near the best markets.

We thin the lower limbs first, taking off the imperfect ones, and then the small ones, and leave only one of a bunch. If the bunches are too close, six inches to a foot apart, depending on the variety, sometimes all of a bunch should be taken off. One should be careful not to break off the twigs when breaking off the stems of the apples, as in so doing he may destroy the fruit buds for the next crop. Both hands must be used to prevent taking off the fruits or twigs that should remain.

It is well to commence thinning about six weeks to two months after the bloom drops, and if they develop well it may be best to go over some or all of the trees twice to remove any that have been injured by codling moth, curculio, apple scab or otherwise, and also there are apt to be some that were overlooked the first thinning, or were not thinned as severely as should have been done.

We are too tender hearted or weak kneed in our thinning and have not the courage to take off enough for best results. It often looks like we have taken off plenty when thinning, it being sure to look that way early in the season, and when they grow a few weeks they are so full it looks like they had been thinned very little. Take warning and remove plenty, and still there will be enough left to spare a few for the insects and scab which may show later and be removed at a later thinning.

After the thinning, which should be done before the second brood of the codling moths appear, the trees should be given their spraying with arsenate of lead to prevent that late brood doing injury, and it is well also to use a fungicide to keep off the late apple scab or sooty fungus (clouded appearance), or bitter rot farther south, and also to protect the foliage and keep it healthy. Without healthy foliage the fruit can not develop properly and will not color as it should, taking on that rich beautiful finish which is so attractive.—American Cultivator.

HYDRATED LIME.

"Can you tell me anything about this hydrated lime?" "I can tell you it is correctly named," Percy replied.

"Hydrated" means watered, and as an investment is properly classed with other watered investments. If you prefer to use hydrated lime I would suggest that you buy fresh burned lump lime and do the hydrating yourself, which only requires that you add eighteen pounds of water to each fifty-six pounds of quicklime. In other words, that you slack the lime by adding water to it. Both quicklime and hydrated lime are known as caustic

lime. Webster says that the word caustic means capable of destroying the texture of anything or eating away its substance.

"This definition is correct for caustic lime as you can easily determine by keeping your hand in a bucket of slaked lime a few minutes. In an experiment conducted by the Pennsylvania Experiment Station, during a period of sixteen years, eight tons of hydrated lime destroyed organic matter equivalent to thirty-seven tons of farm manure, as compared with equivalent applications of ground limestone; and, as an average of the sixteen years, every ton of caustic lime liberated seven dollars worth of organic nitrogen as compared with ground limestone. That this much liberated nitrogen was essentially wasted and lost is evidenced by the fact that larger crops were produced where ground limestone was used than where burned lime was applied."

Just a word more. We have seen hundreds of farmers applying quick or caustic lime to their land. Would they have done it if they had read of the above experiments? Does not this show that as farmers we cannot afford to be ignorant of what science teaches in this and many other particulars?—From Dr. Hopkins, "Story of the Soil."

SPARE THE DOVES.

Mr. J. A. Osgood of Sierra Madre writes regarding a clipping for the Boston Transcript that it "brought a sigh of regret to my mind, as I thought of the many doves which I have shot in the past. I trust the clipping may cause many of my brother sportsmen to think twice before again taking part in the annual slaughter of this bird so useful to the farmer." The paper says:

"The turtle doves are great feeders on the seeds of weeds, and do much to protect growing crops from harm through the ravages of those weeds on the seeds of which they feed. The Government Biological Survey, in conducting its investigation to determine the economic value of these birds, found in the stomachs of three turtle doves 23,100 hawkweed seeds, with the seeds of several other kinds of weeds which have caused the farmer inconvenience and expense during a larger portion of the crop growing season. These birds are much more effective as a weed exterminating force than an army of men with hoes and weeders, because the best that man can do is to keep the weeds in check to a certain extent, while the seed devoured by the bird is destroyed and prevented from taking root. It is estimated that the natural increase of these birds, if they were allowed to multiply without interruption, would save the American farmer at least $500,000,000 a year."

HANDLING APPLES.

Few people realize the importance of handling apples with care while picking, packing, and marketing. Apples are bruised very easily, and especially those varieties having a tender flesh or skin. Bruises mean not only an unattractive appearance, but a real waste of fruit by having to cut out the bruised tissue. Probably the greatest damage from bruises, however, results from the fact that the bruises furnish an entrance for fungus or rot spores. These spores, or "fungus seeds," are as fine as dust and float in the air. If they happen to lodge on a bruised or broken spot on the apple, they take root and grow and spread through the apple, causing it to rot. Wrapping or covering the apple may not always protect it, as the spores may have lodged on the apple before it was picked. However, if the skin and flesh of the apple can be kept intact and not bruised or broken, there is not much danger of the fungus or rot finding its way into the apple.

To prevent bruising, apples should not be dropped or thrown into a bucket, box, or barrel, and in pouring from one vessel to another care should be taken that the apples are as close as possible to the bottom of the vessel in which you are placing them before the pouring begins. If a pail is used to pick in, it should be small enough to lower into the boxes and, even then, holding back the apples with the hands is a good idea, as it breaks the fall and lessens the bruising. No apple which falls from the tree should be allowed to go into the first grade apples.

The degree of care it will pay you to exercise in handling your apples will be determined largely by the grade of fruit you are putting on the market and the care with which you guard your reputation as a fancy fruit producer.—S. Van Smith, Colorado Agricultural College.

A large orchard poorly planted and poorly tended will not produce the results of fewer trees well cultivated.

Don't summer trim young trees too liberally. Too much foliage taken from the tree weakens its feeding power.

There is no secret about the success of a man who adopts the best methods and works on them.

THE REAL WAR WITH JAPAN.

"There is not the slightest doubt," declares George T. Marsh in Sunset Magazine for August, "that Japan is prepared and anxious to wage war with not alone the United States, but all alien powers, accounting her chances of winning such an event, now, as an almost foregone conclusion. In so far we are right in our belief; we err only in the application of the word "War." To the meanest observer it should be perfectly apparent that we represent Japan's best all-around market for the disposal of her products, and that it would be the height of folly on her part to wantonly antagonize that market. Still, there is not the slightest doubt that Japan has been preparing for and expecting war against the United States of America, primarily, and, in a lesser measure, against the other great powers as well. This is no innovation, for during the years of our blindness—years in which she cleared her vision and watched our growing neglect of our commercial maritime interests—she has been preparing steadily and secretly to cope with us in this war, triumphantly; not in arms, but trade. None but the blind and deaf could possibly be exonerated for any ignorance of what all her activities of the past thirty years have converged toward, and only the dumb should be excused for failure to mention it."

First-class fruit in first-class shape will probably develop an inquiry for more of the same kind.

Farmers who would be successful apple growers must learn what a good marketable apple is, and then grow it.

BEIERSON MACHINERY CO., MANFRS., PORTLAND, OREGON

Durham, Butte County, will set about 900 acres of almonds.

Small Fruits and Vegetables

NITRATE OF SODA FOR STRAWBERRIES.

Experiments at the New Jersey and other stations showed an increased fruit yield in strawberries of from eighteen to thirty-one per cent by the use of 200 pounds per acre of nitrate of soda applied broadcast in the spring after the foliage had gotten well started, but before the bloom appeared. Plants thus treated showed a deeper color, much stronger bloom, larger leaves and greater freedom from rust than plants not receiving the soda. Where nitrate of soda is thus used care should be taken that there be plenty of available phosphoric acid and potash in the soil or the vine growth will be excessive. Experiments in Florida, where berries are shipped a thousand miles to market, indicate that nitrate of soda may injure the shipping qualities of the fruit and should not be used on the plants for at least three months before shipping begins.—Green's Fruit Grower.

THE STRAWBERRY.

It was John Burroughs who thus wrote of the strawberry: "Let me not be afraid of overpraising it, but probe and probe for words to hint its surprising virtues. We may well celebrate it with festivals and music. It has that indescribable quality of all first things—that shy, uncloying, provoking barbed sweetness. It is eager and sanguine as youth. It is born of the copious dews, the fragrant nights, the tender skies, the plentiful rains of the early season. The singing of birds is in it, and the health and frolic of lusty nature. It is the product of liquid May, touched by the June sun. It has the tartness, the briskness, unruliness of spring, and the aroma and intensity of summer."

DOES BETTER SEED PAY?

By Martin Nelson, Professor of Agronomy Arkansas Col. of Ag.

Just as it is true that blood and breeding tell in man and animals, so it is equally true that blood and breeding tell in the plant kingdom. The laws of heredity apply as strongly to the cotton plant as to any other creation.

This being true, better seed means better cotton. Better cotton means several things: It means stronger cotton plants. It means, other things being equal, earlier maturing cotton. It means more cotton per acre. It means a better grade of cotton. It means stronger, longer and better fiber. It means more returns for money and labor expended. It means more respect for the grower; and, finally, it means a better farmer.

Is the stock of seed used by the majority of cotton growers a pure strain of high quality, bred up to the point of high yield? It is not. The majority of seed used comes from the public gin. It is a mixed strain. It cannot be otherwise. It is lacking in quality, for it comes from all sorts of soils, from crops that have received poor treatment in many cases. Such seed produces weak, uneven, slow growing, late maturing plants. That farmers everywhere are beginning to realize this fact is a most hopeful indication. They are making inquiries for better varieties and for sources of seed, realizing full well that there is much to be gained.

With a soil no longer virgin, with yields much reduced, with the cost of labor slowly but surely increasing, with the great enemy, the weevil, either coming or already here, every effort must be made to counteract the drawbacks and not only make cotton pay but make it pay better. Good seed of earlier maturing, better yielding varieties of improved quality is an important means of producing more and better cotton.

Every farmer, without delay, should get at least a start of pure seed of a well chosen variety. This will cost a little more than the ordinary seed, and it may be necessary to get it at a distance where cost of transportation will also be an item of additional expense, but with ordinary good management this relatively small expenditure will have to be made only once. Grow this on land sure to bring a good crop, have the cotton ginned separately after the breast of the gin has been completely cleared of seed, and he has a supply of pure seed for a large area next year. After this he has all the pure seed he will use on the average farm and seed to sell to his neighbors, which will immediately net him more than his first outlay for the improved seed. He is in a position from this time on to do a good business selling seed in addition to his increased production of lint cotton. Every community in the cotton growing area of the state needs a grower of cotton seed for planting purposes, and needs him badly.

FARMERS INSTITUTES.

The rapid development of farmers institutes is no more aptly illustrated than by the fact that when an appropriation was made by Congress some six years ago to enable the Department of Agriculture to appoint a special officer to investigate and report upon farmers institutes and similar organizations, there were only 2,772 institutes in the entire country, with an approximate attendance of 820,000. In 1909 all of the states and territories had institute organizations, and there were 4,926 regular institutes, with an attendance of 2,196,568. There have been also independent and round-up institutes, railroad specials and other forms of institute activity attended by 710,131 persons, making the total number present at all forms of institute meetings during the year about 3,000,000.

Among the more marked developments along institute lines are the railroad specials which are now conducted in most of the states. These specials are equipped with illustrative material and provided with a corps of lecturers who address audiences of farmers at the local stations on the lines of the road. One hundred and fifty-five thousand persons were reported in attendance upon these trains during 1909, and had opportunity to hear the lecturer and examine the exhibits illustrating the practical value of the instructions given. No doubt when the figures for last year become available it will be found that there has been no let up in the popularity of this method of agricultural instruction.—Wisconsin Agriculturist.

Keep a blank book and jot down the mistakes you make this year as things to be avoided next year. It is easy to remember what you made money on, but it takes a pretty smart man to see his own failures.

The Ornamental Garden

LOW GROWING SHRUBS.

Miss K. O. Session.

Cotoneaster microphylla promises to be one of the very few shrubs that remain small and low and can be trained for a low wall covering, or against the foundation for a finish. It has a very small dark green leaf, undersurface wooly, giving a decidedly greyish green appearance to the plant. The flower buds are minute and pinkish, the blossom white and small, followed by a rich red berry which lasts for some months. In some parts of England this plant covers walls of houses almost as an ivy and so trained and sheared, gives a most charming moss-like effect. It does not thrive where the climate is very rigorous.

There is great need of very slow and very low growing shrubs. A few now in cultivation here are the creeping Japanese juniper, the tripartita juniper, repheolepis orata, a low shrub with white flowers and dark blue berries, a very excellent finish for shrubbery planting or for a bed near the walk.

Eleaganus variegata is slow and good, but must be trimmed finally quite severely. Metrosideros robusta is reported to be a very beautiful scarlet flowering shrub, very dwarf in habit.

A few plants are now on trial here. Some of the heathers, the ericas, in variety, are desirable for their dainty blooms in winter and spring, but they require partial shade and leaf mold soil and no cultivation to destroy their fine hair-like roots.

There is a dwarf growing lantana that gives a mass of color and stands heavy trimming, but must be judiciously placed in the garden, as they are ever bloomers.

Crinum moorii, is at present in its glory. It has a tall stem of two or three feet, crowned with a cluster of large delicate pale pink blossoms that develop gradually. The stalk bears blossoms for a long time. The plant is large and decorative when not in bloom but becomes deciduous as the flower buds begin to develop. It grows well in the open sun but also flourishes and seems to last longer in partial shade. Its perfume is delicate and pleasing. It is easily cultivated and increases rapidly.—California Garden.

LAWN PLANTING.

We all know what a pleasing sight it is to see a dark green, velvety lawn, and we all agree that the lawn is the prettiest feature about the front garden. Yet we see so many neglect front lawns here, and a good many front gardens, where the people never made an attempt to grow a lawn at all, perhaps on account of the neighbors' "bad luck." We may admit that it takes a little more work and expense to grow a lawn here than it does in the East but at the same time, let us remember that when we have a good lawn here once, it is a continual pleasure the year around and year after in the, while in most of the eastern cau es the lawn only lasts during a to summer months. Therefore we in n well afford a little extra work so a few more dollars in acquiring a sa perfect lawn, if we make the attempt at all.

In starting the work of planting the lawn, first see that you have the correct grade. Avoid if possible a flat, impressionless grade. A lawn with a gentle slope, if ever so small, towards the walks, always looks better. Almost any kind of soil can be "doctored," so it will grow grass to perfection, as long as it is not hardpan. Where this is the case of course soil must be filled in. Forget about the old time necessity of loading up the lawn spaces with stable manure.

Where the soil is very heavy or adobe, pick up the ground and apply a coat of hydrated lime, 100 lbs. to 1200 sq. ft. Wet down and let it lay a few weeks, watering it once a day. The lime will cut through the soil and make it easy to work. A load of sand will also work wonders on soil of this kind. When through grading, see that the proposed lawnspaces are loosened up thoroughly to a depth of 6 or 8 inches. Then rake over to a smooth finish and apply the artificial or so-called commercial fertilizer at the rate of 100 lbs. to 800 sq. ft. If the soil is very light, use half and half of bonemeal and fertilizer. In heavier soil use fertilizer alone. Rake in your fertilizer and be sure it is thoroughly mixed with the soil. Now sow your seed carefully and evenly at the rate of 1 lb. to 125 sq. ft. Kentucky blue grass seed will grow the best looking lawn here. A mixture of clover and blue grass makes a hardier lawn; use 1 lb. clover to 10 lbs. grass seed. When through sowing rake in seed taking care not to displace it. Never attempt to sow on a windy day. After seed is raked in, cover with sawdust, 1 sack to 175 sq. ft. The sawdust protects the seed germs from the sun and keeps the surface from crusting after watering. Roll the lawn until it is firm and then water thoroughly with a gentle spray, taking care not to wash out the seed or displace the covering. From now on, keep the lawn wet all the time, watering as often as 4 to 5 times a day, until grass is up, which will take from 9 to 11 days. Then diminish watering to once or twice a day. Start in cutting the grass as soon as big enough for the lawnmower to nip the tender tops. It requires a sharp lawnmower to cut a new lawn. After lawn is cut once, a thorough watering three times a week is sufficient to produce a perfect looking lawn.

A lawn planted after these directions should be ready to cut in five weeks and will stay a perfect lawn for from ten to twenty years, if kept free from weeds and given commercial fertilizer twice a year, in the spring and the fall, at the rate of 100 lbs. to 1000 sq. ft.

It is needless to add that a coat of commercial fertilizer will also work wonders on an old and yellow lawn, if the proper amount of water is applied afterwards.—Eugene Johansen in California Garden.

Strips of cloth are far better for tying plants to stakes than cord, as the latter is apt to cut through the stalk.

Hosts of young men are reckless because they believe that by and by they can be what they will. Hosts of old men are hopeless because it seems impossible that they can ever be anything but what they are. Both are wrong.—Phillips Brooks.

PAYS FOR ITSELF EVERY THIRTY DAYS

Without a doubt Clark's Double Action "Cutaway" Harrow with Jointed Pole is a most wonderful farm tool. It cuts the soil twice, throwing it in opposite directions, filling in the hollows, thus leveling the land **All Single Action Harrows have to be Driven in Half Lap.** It is drawn by two medium horses. It can be set to move the earth but little, or at so great an angle as to move the earth eight or nine inches. Runs true in line of draft. A customer wrote recently that his "Cutaway" pays for itself every thirty days in labor saved.

The Jointed Pole takes all weight off the horses' necks, and keeps their heels away from the disks.

We make a "Cutaway" for every crop. Every need is fully supplied by the different styles of genuine "Cutaway" Tools. If your dealer won't supply you, we will.

Write us. "Intensive Cultivation," our new booklet, is free. Send a postal to-day.

Hatched from Well-Bred, Heavy Laying S. C. White Leghorn Hens. Well-Bred Stock pays the best. Write Us for Price List.

Western Hatchery

Petaluma, Cal.

Sacramento Valley Thanksgiving turkey will be the largest and finest ever.

General Agriculture

ORIGIN OF THE GRANGE.

The Order of the Patrons of Husbandry originated in the mind of O. H. Kelly, a man of New England birth, who went to Minnesota in his early manhood and became a farmer in that section of the country.

In 1864 he was appointed a clerk in the department of agriculture at Washington. Two years later, in January, 1866, Mr. Kelley was commissioned by Hon. Isaac Newton, commissioner of agriculture, to visit the Southern states, lately in hostility to the government, for the purpose of obtaining statistical and other information in regard to the condition of the South, and report the same to the department at Washington.

It was while traveling in the South in obedience to these instructions that the thought of a secret society of agriculturists, for the protection and advancement of their interests, and as an element to restore kindly feelings among the people, first occurred to Mr. Kelley.

The idea of giving women full membership in the proposed Order originated with Miss Carrie A. Hall of Boston, Mass., a niece of Mr. Kelley,to whom he had imparted his views of the new association after his return from the South. In the full formation of the Order, six other men were directly associated with Mr. Kelley, namely, William Saunders of the department of agriculture, who, next to Mr. Kelley, did most in originating the Order, and Rev. A. B. Grosh of the same department, William M. Ireland of the postoffice department, Rev. John Trimbel and J. R. Thompson of the treasury department, and F. M. McDowell, a pomologist of Wayne, N. Y., all of whom, with one exception, were born upon a farm.

These seven men were founders of the Order, and for nearly two years they labored with great energy, and with a faith and zeal amounting almost to inspiration, until, with the assistance of friends who became interested in the plan they completed a well-devised scheme of organization, based upon a ritual of four degrees for men and four for women, which is unsurpassed in the English language for originality of thought, purity of sentiment, and beauty of diction.

Having formed a constitution to govern the Order to which this ritual was adapted, these men met on the 4th day of December, 1967, and constituted themselves the National Grange of the Patrons of Husbandry, with William Saunders as master, J. R. Thompson, lecturer; William M. Ireland, treasurer, and O. H. Kelley, secretary. The remaining offices for obvious reasons were left vacant.

The little brown building in which the organization was effected was at that time the office of Mr. Saunders, and stood embowered with the trees in the gardens of the agricultural department on the corner of Four-and-a-half street and Missouri avenue. Later the late Colonel Aiken of South Carolina and other interested members of the Order made vigorous efforts to have the government preserve this historic building, but they were unsuccessful in their efforts.

The first Subordinate Grange was organized in Washington, D. C., the 8th day of January, 1868, as a school of instruction, with William M. Ireland as master.

The first dispensation for a Grange was granted at Harrisburg, Pa., the 4th day of April, 1868, but the first regular Suborbinate Grange to which a charter was issued was organized at Fredonia, N. Y., the 16th day of April, 1868.

The first State Grange, that of Minnesota, was organized the 22nd day of February, 1869. The new Order made slow progress up to 1872, and only 257 Granges having been organized in the entire country. During the year 1872, 1105 were organized, and the Order has an existence in twenty-two states.

The first meeting of the National grange, as a delegate body, was held at Georgetown, D. C., the 8th day of January, 1873, with six of the founders of the Order and seventeen delegates present, representing eleven states; six of the delegates were masters of State Granges, and the remainder were deputies in the Order. In addition to these, four women were present, viz.: Miss Carrie A. Hall, Mrs. O. H. Kelley, Mrs. D. W. Adams, and Mrs. J. C. Abbott. The total number of Granges organized previous to this meeting was 1362. Nearly 30,000 charters have been issued to the present time, and the organization is now increasing in membership and influence faster than at any previous time in its history.

ALFALFA SEED ADULTERATED.

Too much care cannot be exercised in the selection of grass, clover and alfalfa seed. The latter is especially subject to adulteration with cheaper seeds that closely resemble it, says the Alberta Homestead, and the great danger lies in the fact that with the adulterants some noxious weeds may be introduced which will cause endless trouble and work in the future. It is almost impossible for the average individual to tell the difference between alfalfa, yellow trefoil and sweet and red clover seeds. Alfalfa is frequently adulterated with these seeds by unscrupulous dealers, who, owing to the great demand for the seed, cannot resist the temptation. Good alfalfa seeds are of an obscure greenish or reddish yellow color, while the defective or immature seeds are usually brown and generally shriveled. The shape varies, but the majority of the seeds are kidney shaped.

Every farmer should know something about the history of the seed which he contemplates buying. It is an excellent idea to test the seed for vitality and purity; oftentimes seed is low in vitality and has as high as 15 to 25 per cent of weed seed. Such seed is usually offered at 10 to 15 per cent below market quotations and is likely to be more expensive than the higher priced, pure seed.

It is a simple matter to make a germination test. Count out 50 or 100 seeds of the kind to be tested and place them in a plate between two pieces of moistened flannel cloth. On a slip of paper record the variety, the number of seeds and the date. Place the slip on the edge of the plate. Cover the whole with another plate, which is inverted. Keep the plate at room temperature for several days. Examine the seeds daily, and if the cloths become dry, sprinkle a little water on them. At the end of a few days count the seeds that have sprouted and from that determine the percentage of good seed.

THE ORIGIN OF ROCKS.

The geologist divides rocks into three general classes—igneous rocks, originating from the molten magma forced upward from the bowels of the earth, such as granite and the various lavas; sedimentary rocks, consisting of disintegrated particles of the igneous rocks which have been reformed into rocks themselves, such as sandstone; and metamorphic rocks, consisting of igneous or sedimentary rocks whose composition has been greatly changed by intense heat, chemical action, or other causes, as, for instance, a limestone that has been changed to marble.

Sedimentary rocks, as stated in the geologic atlas of the United States Geological Survey, are usually made up of layers or beds which can be easily separated. These layers are called strata, and rocks deposited in such layers are called stratified. The surface of the earth is not immovable; over wide regions it very slowly rises or sinks with reference to the sea, and shore lines are thereby changed. As a result of upward movement marine sedimentary rocks may become part of the land, and most of our land areas are in fact occupied by rocks originally deposited as sediments in the sea.

Sandstone is perhaps the simplest example of a sedimentary rock. Obviously sandstone was once sand, and again each grain of rock was once a part of some older rock. This sand was first eroded and then deposited and either subjected to great pressure by overlying masses perhaps thousands of feet thick or cemented together by chemical solutions. Where the stone was formed by simple pressure it contains a large proportion of open spaces and thus becomes an ideal water bearer. Some sandstones will carry as much as six quarts of water to the cubic foot of stone. In other varieties the interstices may have been filled with cementing material, so that the rock may be for all practical purposes almost as dense as granite.

EXPORTS OF MANUFACTURES.

The value of manufactures passing out of the United States in the calendar year 1911 may exceed one billion dollars. This estimate is based upon figures of the Bureau of Statistics, Department of Commerce and Labor, covering the exports of manufactures in the nine months ending with September, 1911, which amount to 478½ million dollars for finished manufactures and 240½ million for manufacturing, making the total exports of manufactures in the period named 719 million dollars, against 612 million in the like period of 1910. The increase in the nine months of 1911 over the like period of 1910 is 17.48 per cent, and in case the increase during the remainder of the year continues at the same rate the total value of manufactures passing to foreign countries during 1911 will be about 970 million dollars. When to this is added the value of manufactures going to Alaska, Porto Rico and Hawaii, not included in the exports to foreign countries, the total outward movement of manufactures from continental United States in 1911 will pass the billion dollar line. This will bring the total value of manufactures exported in 1911 to more than twice that of ten years ago and more than five times that of twenty years ago, the exports of manufactures in 1901 having been 447½ million, and in 1891 about 185 million dollars.

One shipper of Sutter County sent out fifty-six cars of grapes this season.

John Deere Engine Gangs and
Flour City Gasoline Traction Engines

John Deere Engine Gangs

At the Winnepeg Motor Contest

In the plowing test ten of the winners out of a possible thirteen pulled John Deere Engine Gangs.

The awards were divided:

4 Gold Medals
3 Silver Medals
3 Bronze Medals

Only one man allowed on a plow. With one lever to two bottoms, one man handled a John Deere of any size and finished with square ends and straight headlands.

Flour City
took the
Gold Medal
in
1908—1910—1911

Made in three sizes
20 H. P. for $2000
30 H. P. for $2600
40 H. P. for $3500

The same price they sell for in the East.

Bees and Their Care

MARKETING THE CALIFORNIA HONEY CROP.

By Ralph Benton.

There is a great deal current today about the organization of farmers of all classes—stock men, grain men, raisin men, walnut men, and even bee men—organization for the seemingly laudable purpose of securing "better prices" for their products. There are strong reasons for this movement, for the honest hardworking farmer who is too busy making hay while the sun shines to bother much about marketing conditions, either buying or selling, has been exploited on every hand and in many instances unjustly deprived of a large part of his rightful returns as a producer. But when he talks about organizing to secure better prices there are few people interested in his talk and, in many cases for good and sufficient reasons, he gains but little response from his neighbor of the same class; and meanwhile the exploitation goes on.

When the beekeeper or any other producer says, "Let us organize and secure better prices for our products," I repeat, he only interests himself and perhaps a few of his less dubious and more socially inclined neighbors, and that is all. But on the other hand, let this same producer say, "Let us organize and secure better prices for our products and cheaper prices for the consumer," not only does he interest himself and a few of his more hopeful neighbors, but all of his fellow producers and the whole consuming public alike. His fellow-producers, heretofore unwitting competitors, prick up their ears because of the apparent anomaly of his cry, "Better prices for ourselves and cheaper prices for the consumer." They wonder how Neighbor Jones is going to do it. "Think of it! Better prices for ourselves and cheaper prices for the fellow down in the city or the fellow back East who has to eat what we grow! Let's hear how you are going to do it, Neighbor Jones; this interests us." And the fellow down in the city who is pegging away on a limited salary with a large and increasing family to clothe and feed, with all the other expenses of car fare, gas bills, electric bills, laundry bills, ice bills, fuel bills, telephone bills, water bills, taxes, street assessments, property payments and what not, picks up the evening paper to read out of sheer nervousness on the way home from the office and there meeting his eye in big headlines, reads, "Farmers to Organize—They say they can by so doing materially reduce the cost of living for the consumer."

Oh, what a relief! "Materially reduce the cost of living!" Is it possible? Can he really believe his eyes? Say, but that is the most interesting thing he has read in a long while and he reads every inch of both morning and evening papers every day. Why this even beats reading the "pinkey" and the latest baseball news. Think of it! Reduce the cost of living! And that evening at home at the dinner table after the baby has been put to bed he looks up smiling at his wife as she seats herself by him: "What do you think I saw in the paper tonight? Why there is a bunch of farmers up the country who have gotten together and say they can reduce the cost of living for us a whole lot by dealing more directly with the consumer. I'm going to put Grocer Hopkins next to those fellows. If he could deal directly with them and get things as cheap as they say they can furnish them, he'd double his business, he could sell things so much cheaper. I am going to tell the boys in the office about it and I'll bet every one of them will deal with Hopkins if he gets next to the farmer and can deliver the goods at the price we can afford to pay."

Beekeepers! when we talk about organizing to get "better prices" we are putting the emphasis on the wrong thing. What we want to do is "to organize to reduce the price of honey for the consumer," and that will enable him to eat and buy more honey, and that will cause the grocer to lay in a larger stock of honey to meet the demands of his customers, and thus on the basis of an increased business in this line, net for him a fair income on honey; and this demand of the grocer will enable your representative in the field to place at a minimum of expense all the orders for honey you can fill, which will enable you to move your honey rapidly and at a fair figure, encouraging you to become a heavier producer and the honey business will be looking up. And this, after all is said, is about all that the honey producer wants—a fair price for his product and a rapid and permanent market for all he can produce.

A second grave mistake which the honey producers have made in all of their attempts at organization is to "organize to hold their honey for better prices" or "to secure the prices they want." No policy could be devised more suicidal than that. Several years ago we visited the warehouse of one of our associations that had been attempting to "stand together" on the price of honey, and we found the warehouse stocked with honey from two years back, the manager in a troubled state of uncertainty, and the members of the association doubting and disgruntled with the enterprise.

Whatever is done, never organize a marketing association on the basis of holding honey for a better price, for such an organization resolves itself into a "holding organization" and is a failure so far as the purpose for which it is designed is concerned. When you organize, organize "to market honey on the co-operative plan" and see to it that you move your honey into the market at whatever price you can get for it. This is the secret of success, e. g., that you have a market in view, a channel through which to move your honey rapidly and regularly, and your business management under your control and on a salaried basis. It is important that there be one central honey exchange for the state which should have full control of all representatives in the field and should also have entire control of all shipments so that there can arise no business misunderstandings in the placing of orders. It is equally important that each locality have its "local co-operative marketing" association embracing only a limited area in order to insure frequent meetings and to establish business confidence that flows from personal touch. As a con-

necting link between these local associations organized wherever a dozen or twenty producers can be gotten together, and the central state exchange, an intermediate unit, the district exchange, might profitably be introduced, one to each of the large honey producing localities, e. g., a Southern California district exchange, a San Joaquin Valley district exchange, and a Sacramento Valley district exchange. These district exchanges should be assembling points for the honey of the local associations within their territory and should be rallying centers for co-operative marketing promotion work; but should not be distributing points except under orders from the central exchange.

Let me emphasize that whatever is attempted along the line of organization, be done now, within the next few winter months before February and the busy season opens up. Let the country clubs and associations take the matter up and appoint representative committees to get the bee men together for the formation of the local co-operative marketing associations. The directors of the local association should elect their own chairman and secretary, and these two officers from each local association, together with like officers from similar associations in a given district can meet and form the district exchanges to the number of three, as indicated above. Then we are ready for the organization of the central exchange with provisions for an adequate supply of funds and empowered to employ a salaried office force and field representatives in the eastern markets to place the honey close to the doors of the consumer. Part of the legitimate work of the central exchange should be to inaugurate a systematic advertising campaign for California honey; and in order to leave them free for this and the business of marketing they should be relieved of all promotive work of organization in the district exchanges whose chief business should be to organize local associations, get the honey together and to execute the orders of the central exchange.

Bear in mind that it is not necessary to "control" all or even a major part of the honey produced. We think of the citrus exchange as a model of a successful marketing association; yet it is safe to estimate that half the orange crop is marketed outside of the exchange. All that is necessary is that a few of the co-operatively inclined producers get together and do "business" in a business-like way and your efforts are bound to bear fruit, and when you begin moving honey successfully into the market, the more backward will fall in line and swell your numbers.

CEMENT PRODUCTION.

Ten years ago the production of Portland cement for the first time passed the 10,000,000-barrel mark, showing an increase of 2600 per cent over the production of 10 years previous, and the giant strides that had been made in the industry were widely remarked. Even this production was small compared with that of the present day. In 1910, according to the report on cement by Ernest F. Burchard, of the United States Geological Survey, the production of Portland cement reached the enormous total of 76,549,951 barrels, with a value of $68,205,800. This is equivalent to 12,986,152 long tons, valued at $5.25 a ton. It is an increase over the output for 1909 of 11,558,520 barrels, or nearly 18 per cent, and an increase in value of $15,347,446, or more than 29 per cent. This increase alone is greater than the total output of Portland cement in 1900. In addition to Portland cement there was also produced last year 1,139,239 barrels of natural cement and 95,951 barrels of puzzolan cement, a total of 77,785,141 barrels.

Steady Decrease in Price.

The price of Portland cement in 1910 was as low as 73 cents a barrel in some places, the average for the United States being 89.1 cents a barrel. In 1890 the average price was over $2 a barrel and as late as 1903 it was $1.25 a barrel.

Mr. Burchard remarks that measured by the capital invested the cement industry is one of the world's three great extractive industries. In capital employed it apparently far outranks the gold-mining industry of the United States, including Alaska, as well as the copper industry. Only coal and iron stand ahead of it.

The principal constituent of Portland cement is limestone, and Mr. Burchard's report summarizes the most important limestone formations in all the states. The greatest of these are found in the eastern half of the United States, where there are enormous limestone deposits. The report is accompanied by a map showing the distribution of these limestones. The areas they cover comprise many thousands of square miles. The map also shows the location of the operating cement plants in the United States.

THE GRANGE.

History will, I am sure, recognize the Grange movement as the most fundamental as well as the pioneer in the movement to make country life equal to city life and to develop the country folks along the same standards set for others. I am sure in our day and generation nothing else has occupied the same field in this important work. And everything indicates the Grange had a special mission, namely—to encourage the farmer to a higher plane of living and to cheer and comfort him while engaged in his daily work, as well as to demand for him proper recognition and a square deal from the civil community. I am not writing this simply to present Grange arguments, but to have us feel it is a cause in which we all should take pride and hence will give it the attention and time to which it is entitled. It will pay to attend the National Grange and you will get value received while you will be proving your loyalty to the cause we all love. —C. M. Freeman, Secy. National Grange.

CONTENTS THIS WEEK

WHAT AUSTRALIA IS DOING FOR ITS SETTLERS; 513.

CITRUS AND TROPICAL FRUITS.—Orange and Lemon Crops of California and Florida; Increasing Size of Olives; Phosphate Deposits; Citrus Shipments; 514, 515.

DECIDUOUS FRUIT CULTURE.—Thinning Apples; Hydrated Lime; Spare the Doves; Handling Apples; 516, 517.

SMALL FRUITS AND VEGETABLES.—Nitrate of Soda for Strawberries; The Strawberry; Better Seed Pays; Farmers' Institutes; 518.

ORNAMENTAL GARDEN.—Low Growing Shrubs; Lawn Planting; 519.

GENERAL AGRICULTURE.—Origin of the Grange; Alfalfa Seed Adulterated; Origin of Rocks; Export of Manufactures; 520, 521.

BEES AND THEIR CARE.—Marketing the California Crop; 522, 523.

EDITORIAL.—Farmers' Union; Modesto Poultry Show; Going Up; Early Frost; Free Seeds; State Convention; Seed Testing; Many Automobiles; Wholesale Market; Good Poultry Stuff; Studying Agriculture; 524.

AGRICULTURAL NEWS NOTES OF THE PACIFIC COAST.—Northern; Central; Southern; The Coast; 525.

LIVE STOCK AND DAIRY.—Hog Raising; Trespassing; The Man and the Cow; Capacity of Silo; 526, 527, 528.

PROFIT IN THE POULTRY YARD.—Thanksgiving Turkey; Plea for Pure Birds; Fresno Show; Show Calendar; Moulting; Buying a Bird; 529, 530, 531.

QUESTIONS AND ANSWERS.—Freezing Fruit; Galls on Willows; Sticktight Fleas; Black Scale; Jerusalem Artichokes; Pyrethrum; Balanced Ration; Pigs Per Acre; Temperature for Valencias; Curling Citrus Leaves; 534, 535.

VETERINARY.—Throat Swollen; Garget; Nymphomania; 535.

IRRIGATION AND FORESTRY.—Read Your Meter; Bulletins on Trees; 536.

HOUSEHOLD.—Thanksgiving; Thanksgiving That Ran Away; Thanksgiving Recipes; Thanksgiving Day; 538, 539.

PRODUCE MARKET.—Los Angeles Market; San Francisco Market; Deciduous Market; Citrus Market; 540, 541.

STATE FARMERS UNION.

The annual meeting of the State Farmers Union closed at Modesto last week with most interesting and helpful discussions at every session. Homer A. Craig of Santa Clara County was elected President and Guy H. Miller of Modesto, Vice President.

MODESTO POULTRY SHOW.

The first annual Stanislaus Poultry and Pet Stock Show came to an end last Saturday night. The Cultivator representative was on hand and sent in an account of it with a full list of the winnings, but owing to the slowness of the mails it did not reach the Cultivator until just as we were going to press. Next week it will appear, together with a list of the blue ribbon winners.

GOING UP.

Farmers who did not produce their own hay, truckmen, and in fact all hay consumers, are aghast at the price to which hay promises to mount within the next few months. Already the upward trend is pinching the buyer, and the forehanded man who considered the possibility of a shortage and laid in a big stock is congratulating himself. Unfortunately, much of the hay has passed from producers' hands, but those who have stored their new hay and waited for the present conditions are strictly in clover.

EARLY FROST.

Cotton growers of Northern Texas were severely injured by a first of the month freeze which destroyed much of the cotton in the entire cotton belt. Practically all of the "top" cotton, which crop had promised to be large, will be killed. With the Imperial Valley drawing down large premiums and gold medals at the New York Land Show for the finest short staple cotton produced in the United States, and in view of discouraging conditions over the South, it looks as if cotton culture on the West Coast should be materially advanced.

FREE SEEDS.

We doubt not the coming session of Congress will, with great wisdom, order the continuance of the free seed distribution, and that the representatives and senators will make a touching appeal to newspapers to insert free advertising of free seed distribution, and the farce will go on, with as little advantage to the producing class as in the past. Of all the needless wastes in the agricultural work taken up by the government, this is the limit. Perhaps some day congressmen who have the courage of their convictions will be elected and rise in their wrath and stop this petty graft.

STATE CONVENTION.

The Annual State Fruit Growers Convention, always held in December, is scheduled much later this year than usual. This was made necessary by the change in office of the commission. Heretofore the convention has been held about the first week in December; this year it is deferred to Dec. 19-21 at Santa Rosa, Sonoma County. Messrs. Galloway and Newcomb are pushing the arrangements at the Santa Rosa end, and promise is made for a royal welcome to all who attend. We hope that in next week's paper we will have an outline at least of the program, which Commissioner Cook assures us will be of exceptional interest.

SEED TESTING.

The Bureau of Plant Industry sends out information that, with other seed testing laboratories already established in the United States, one will soon be in working order at the California Experiment Station at Berkeley. These laboratories are established and maintained for the purpose of furnishing information as to quality of agricultural seeds. These seeds are identified, examined or tested according to request accompanying them. Four different tests are made according to request: identification of seeds of weeds or crop plants; examination for presence of dodder, etc.; mechanical purity (this last test influences the determination of percentage of weight of pure seed, foreign seed, sticks, stones, dirt and chaff. Not more than five of this latter test will be made for any one firm or individual in one calendar month); and the last a germination test.

MANY AUTOMOBILES.

Advance information from the Bureau of the Census shows that the number of establishments manufacturing automobiles in this country increased 317 per cent during the last decade. The increase of capital in this manufacture was still greater; it was 653 per cent. The gross value of products turned out showed an increase of 730 per cent. The total cost of materials increased 901 per cent. In dollars the aggregate manufactured product in 1909 was $249,202,000. The number of gasoline operated machines turned out in 1909 was 121,274; electric operated, 3,639; steam, 2,376. As to style of machine, by far the greatest number were touring cars. Of these there were 76,000; runabouts, 36,000; buggies, 4,000; closed vehicles, 3,000; public conveyances, 1,400.

WHOLESALE MARKET.

An Orange County blackeye bean producer recently called at this office to inquire where he could secure $4.50 per hundred for his beans. In his section jobbers are only offering $3.50. The wholesale market quotations in the Cultivator gave him the impression that he could secure $4.50 in the Los Angeles market. His attention is called to the two words immediately preceding the bean quotations. These are "Wholesale Quotations." If the bean growers could unite and establish a wholesale house for the disposal of beans to the retailer, and could supply the beans the year around, that quotation might be realized. From it, of course, would have to be deducted expenses of maintaining that establishment. Producers must bear in mind that market quotations in any paper are merely a guide as to general trend of the market. We know of no means by which producers can secure wholesale quotations for their products. The wholesaler cannot conduct his business, pay immense rents, clerk hire, cartage, freight, etc., and sell at producer's prices. In addition to his own expenses, there is often a percentage to the jobber who has bought in large quantities from the producer. It can readily be seen where this dollar difference between price to producer and to retailer comes in. To us it seems too large a difference. To us it also seems that by proper cooperation and placing the marketing of the farmers' products in the hands of good business agents of their own, better returns should be secured, but to get the producers together is the problem.

GOOD POULTRY STUFF.

One of the customs of newspaper offices is the denominating of copy sent in for publication as "stuff." Perhaps the general public is acquainted with the term "copy," but in ordinary office conversation "stuff" goes. We mention this because this custom has become a habit with many of us, and when a well wisher of the paper refers to his material which will be sent in, and the publisher or editorial staff refers to it as "stuff," it sometimes has given offense.

We refer now to stuff which is in hand for the pleasure and information of our poultry readers. We are planning to give more attention to the poultry department of the Cultivator, for plainly there is an increasing interest in this department of rural economy. Several practical poultry people have sent in communications, and others have agreed to do so within the next few weeks, beginning with the first issue in December. These articles will appear from time to time, probably not in every week's issue, though, with Mrs. Basley's material, there is little question but we will keep original matter before our readers every week.

Mr. Henry Langenschwadt of San Jose, Mr. Baldwin of the same place, Mr. Goodacre of Compton, Mr. Schofield of Gardena, Mrs. King of Gridley, Mr. Boyer and Mr. Bickerdike, both Easterners, and other Californians, will contribute to this department. It will be good stuff and worth the reading.

STUDYING AGRICULTURE.

On the principle that if more thorough agricultural knowledge is of value to the coming generation it must also have something worth seeking by the older heads who have to deal with today's problems, farmers in the neighborhod of Gardena are taking up the matter of getting more definite information as to scientific facts with which they have to deal. Mr. Stevenson recently commented upon the better opportunities of youngsters of today, and discussed with some of his neighbors the advisability of their demanding for themselves some of these advantages. The teachers in the Gardena High Shcool agricultural courses agreed to unite with parents of the children in this science study, and hopes are now expressed that regular meetings may be held, lectures given and studies taken up by this body of progressive agriculturists.

The first meeting is to be held this week, and Dr. Powers of the Los Angeles health office is to make an address, as will one of his inspectors of dairies. This will tend toward one beneficial result, that is, bringing dairymen and health officers together for a better understanding. Some dairymen have felt restive under requirements—and more often methods—of these inspectors. Sometimes this has been with cause; sometimes by lack of understanding on the part of the dairymen. If our health officers will be more considerate, more reasonable, we believe they will meet hearty response from the dairymen, but the political inspector who starts out with the purpose of making trouble has it in his power to do it to his satisfaction.

We hope to hear report from the meetings at Gardena that the older generation has taken hold of the study of rural science with as much zest as do the youngsters.

Agricultural News Notes of the Pacific Coast

Northern California

Chico, Butte County, is affected with a pest of flies.

Farmers near Willows are receiving several carloads of pure bred stock.

Colusa County prune growers are shipping their product to market by boat.

Biggs, Butte County, has been harvesting some strawberries 4½ inches in circumference.

The Sacramento Valley shipped over 12,000 cars of fresh deciduous fruits during the summer.

Preliminary work is being done on the reclamation of a tract of land near Elkhorn, Yolo County.

Congressmen over the state are using the local newspapers to advertise their annual seed distribution.

Improved railway facilities will greatly extend the beet planting area near the Hamilton Sugar Factory.

One Sutter County farmer reports 1700 sacks of beans from 65 acres and 700 sacks of buckwheat from 44 acres.

The home of General Bidwell at Chico will be reproduced at the coming Citrus and Olive Exposition at Oroville.

An agent of the Department of Agriculture was in Oroville recently, investigating as to the "sweating" of oranges.

A five mile drainage ditch is to be excavated westerly from Wheatland. Dynamite will be used largely in the excavation.

Siskiyou County contemplates an irrigation system which will cover nearly 120,000 acres and will cost about a million.

The reclamation district near Knights Landing has installed a forty inch pump with a capacity of 60,000 gallons a minute.

The seedless apple has bobbed up again, and this time Modoc County claims a tree with perfectly seedless and coreless apples.

Milk Inspector for Vallejo is now taking samples of milk which it is declared are altogether too short on butterfat and too long on water.

A gathering of dairymen and creamerymen of northern coast counties recently met at Ferndale and discussed methods of improving quality of dairy products.

Arrangements are made with the fruit express companies by which it is hoped that the citrus districts of Butte County will soon be supplied with refrigerator cars.

Santa Rosa is making extensive preparations for the coming State Fruit Growers Convention. Commissioner Galloway and Mr. W. I. Newcomb are heading the committee work.

Improved methods of packing grapes will cause extensive shipments to be held in cold storage in Eastern markets until the holiday time. It is thought these grapes will largely replace European grapes, which have been a favorite heretofore.

A meeting of the Corning Olive Growers Association recently held elected the following officers for the coming year: president, R. D. Forrest; vice president, J. B. Maynard; secretary, O. S. Davis; treasurer, Dr. E. E. Dotson; committee on constitution and by-laws, Dr. E. E. Dotson, S. Larrabee and G. V. Santee.

Central California

Several calves in herds near Tulare have died of blackleg.

A quantity of squirrel poison has been received at Clovis.

Porterville, Tulare County, is shipping oranges to the Orient.

Santa Clara County is to distribute 30,000 cartons of prunes at the Chicago Land Show.

Coalinga, Fresno County, is discussing the advisability of forming an irrigation district.

The annual convention of the Farmers' Union of California was held at Modesto last week.

Second crop Muscats are being delivered at Dinuba, the crop going principally to the wineries.

A bee keeper at Tulare estimates fully $23,000 worth of honey shipped from that section this season.

The first annual poultry show at Modesto, held recently, was declared to have been a complete success.

Twenty-two cars of Arizona stock were recently shipped to one Tulare County ranch for winter pasture.

Santa Clara Valley Pomona Grange No. 4 recently met in San Jose and elected officers for the coming year.

Terra Bella Development Company is developing a fine lot of water in wells from three to four hundred feet deep.

The Monterey Bay Counties League has been organized to look after the welfare of the section surrounding Monterey Bay.

At the last Tulare Grange meeting John Tuohy made an address on "Why Are There So Few Farmers in the Legislature?"

About half of the sweet potato crop of Merced County has been sold and shipped; the remainder is being stored for higher prices.

Rates on raisins from Fresno to San Francisco have been reduced, and are now the same to either San Francisco or Los Angeles.

It is urged that the table grape growers prepare for a campaign of advertising of table grapes before another shipping season.

A heavy frost visited sections of Fresno about the middle of the month, doing some damage to the more ten der garden truck and olives.

The raisin situation is looking rather better, and several hundred tons are said to have changed hands within a short time recently.

The Spreckels Sugar Factory closed its run about the middle of the month. Many improvements will be made in the factory before the next season.

Madera County is making some magnificent apple exhibits in the Ferry Building at Sacramento. They come from the orchard of Mr. Frank Femmons at Ahwahnee.

Members of the Grange in California are being assessed 25 cents per year to cover the expense of establishing and maintaining Grange Headquarters at the Panama Pacific Exposition.

Several San Joaquin boosters are discussing the advisability of forming a monster organization to look after the interests of the entire valley. A meeting will be held in San Francisco Nov. 25.

Southern California

A carload of cotton was shipped from Holtville to New Orleans last week.

Oak Glenn, San Bernardino County, is just finishing on its last red apple shipments.

Beet growers of Talbert, Orange County, are preparing seed bed for next season's crop.

San Diego and Imperial are pulling for a section of the state highway between those two points.

A tract of land near Palmdale, Los Angeles County, will be improved and irrigated, and later subdivided.

Imperial Valley barley fields are already sufficiently advanced so that they are being used for pasture.

The Riverside Fruit Packing Company will build a new packing house on the line of the Salt Lake Railway.

Some three year old trees in the new apple district at Beaumont produced some excellent fruit this season.

The Medical Milk Commission of Riverside has granted certification to one dairy which will supply pure milk to that city.

Herds of cattle are now being shipped into the Huntington Beach section to be fattened on sugar beet tops and pulp.

The Imperial County Fair was by long odds the best ever, and gave a remarkable exhibition of products of the Colorado "desert."

Olive planters have scoured all the nurseries of the southern part of the state, and declare that hardly an olive tree is left unsold.

A number of Imperial Valley cantaloupe growers recently met in Los Angeles and discussed matters pertaining to handling the next cantaloupe crop.

Work on the Yuma Reclamation lands below the Laguna Dam is progressing rapidly, and the former desert section is taking on a vastly different appearance.

A number of growers of Redlands recently combined to fight charges made by a fumigation contractor, but the board of supervisors made ruling that the charges were just.

Redlands, San Bernardino County, will require twenty-one packing houses for the handling of the coming big crop of oranges. The estimate is for 5,000 cars for that one section.

The Interstate Commerce Commission has granted request to reopen the lemon rate case, and has so notified the officials of the Southern Pacific, Santa Fe and Salt Lake Railways.

The Imperial Valley is greatly elated over the winning of a thousand dollar silver cup for the best bale of short staple cotton at the National Land Show in New York City last week.

The Beet Growers Association, which made request of the sugar factories for a $1 raise, has been granted 50 cents, with an additional 30 cents per ton for each one per cent above fifteen.

The Anaheim sugar factory closed its first season's run with a record of 12,000,000 pounds of sugar and 36,000 bags of dried pulp. Over 43,000 tons of beets were sliced. The campaign was 90 days long.

The Coast

The Pima County Fair was held at Tucson last week.

Yerrington, Nev., will ship 700 carloads of potatoes this fall.

A Texas stockman is planting extensively of prickly pear cactus.

A shortage of hogs is reported in the country about Genesee, Idaho.

Orange growers near Yuma are shipping some exceptionally fine fruit.

Yuma farmers are anxious for the establishment of a beet sugar factory.

The Oregon Wool Growers Association will meet at Baker City, Oregon, this week.

Experts of the Department of Agriculture are investigating soil in the Salt River Valley, Ariz.

The "All-American Roadway" plan between El Centro, California, and Yuma, Arizona, is making headway.

Lack of proper threshing machinery has caused great delay in grain marketing of Klamath County, Oregon.

A $5,000 stock barn and a large judging pavilion have just been erected by the University of Idaho at Moscow.

A new apple has been developed at Gold Hill, Ore., said to possess all the good points of the Newtown and Spitzenberg.

The Evening Star Grange of Oregon has recommended that all Grange dues of that state be fixed at 15 cents a month.

A convention of farmers was recently held at Colfax, Wash., to protest against the unjust taxation of farm lands.

Colorado, one of the biggest potato producing states, is now importing potatoes for home use for the first time in ten years.

One prune tree at St. Joe, Idaho, yielded 280 pounds of prunes and netted its owner $14. The tree was a five year old.

The State Veterinarian of Oregon has issued a dipping order for all cattle runnig on range, owing to prevalence of scab.

One apple grower at Cloverdale, Wash., harvested 10,000 boxes of apples, which brought him $15,000. The orchard is fifteen acres.

Seattle, Wash., experienced this year the coldest November weather ever, and that prior to the 15th of the month. It is claimed the temperature dropped to 20 degrees below zero.

Land which will be thrown open to entry in Klamath County, Oregon, is now being inspected by settlers with an idea of filing on Jan. 15. Much of this land contains valuable timber.

A process of sweating wheat prior to manufacturing the flour has been tried at the mills at Harrington, Wash., and declared to excel flour manufactured by the ordinary method.

It is estimated that fifteen carloads of nursery trees, largely apples, will be shipped from Toppenish, Ore., this fall., and that next spring's delivery from the same nursery will average nearly forty cars.

Irrigation, which has greatly increased the size of prunes at West Stayton, Ore., is declared to have far more than paid for itself in the increased price per pound. The prunes in one orchard averaged 30's.

MAN MUST EAT
There is money in
SUGAR and CATTLE

Share in the profits of an agricultural investment, comprising over 21 square miles of rich agricultural lands.

The land has an abundance of water in a district where irrigation, drought and frosts are unknown. Large tame grass pastures have just been prepared.

The land is free from incumbrances, which affords our investors the highest degree of security.

THE PRODUCTS OF THE RANCH ARE CATTLE AND CANE SUGAR, TWO OF THE WORLD'S BIGGEST DIVIDEND PAYERS, AND ON WHICH THE MARKET IS STEADILY ADVANCING.

In this district lean cattle fatten in four months in tame grass pastures and increase 50% to 100% in value.

Cane sugar is manufactured at one-third the cost of beet sugar.

Additional capital is required for improvements and to buy cattle to stock the ranch. A limited amount of investment certificates will be issued in units of $100 cash or on installments. Six per cent per annum interest is guaranteed, and we also share the profits with you. Option given to withdraw your money and profits or to become a part owner of this great property.

Applications for certificates will be filed in the order received. This enterprise is backed by some of the most substantial and well-known business men of Los Angeles. We invite the strictest investigation.

Send for free booklets and descriptive literature.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

HOG RAISING.

By Mrs. M. E. Sherman.

The man with a good stand of alfalfa and plenty of water to keep the alfalfa growing, has a cheap way of turning off pork. Now on an acre of alfalfa eight hogs can readily grow up. A sow with a litter of ten will do well all season on half an acre of alfalfa field. Usually double this number of stock is placed on a piece and when they have eaten it down they are put on another piece. This saves the land from excessive tramping. After the pigs are taken off one piece, if it is irrigated and disked, enough to loosen the soil, the alfalfa will stand heavy close grazing for many years. The pigs should have rings in their snouts to stop their rooting. Alfalfa roots are very sweet to them and they will destroy it rapidly if allowed to have their own way. It makes man feel his superiority when he sees the pigs destroy the plants that would feed them all year. The horses and cattle too will eat the trees that later they would enjoy as shelter against the sun. Forethought, like speech, is the divine in the human race and lifts some of us far above the animal world.

Breeds.

Now I wish to say that this matter is my own opinion and I hope no one will feel hurt over it. I once hurt somebody's feelings deeply because I did not like the breed he raised as well as some other—ignorance, no doubt, on my part. Well, in California at the present time we find black hogs mostly in use. White pigs sunburn and grow mangy in the warmer parts of the state. One does sometimes see white ones in butchers' bunches, but they are rather inclined to be scrubby. The Poland China and Berkshire breeds are a safe investment for any one as they are here in numbers sufficient to make it easy to secure new males whenever needed. The crosses of either of these breeds on the common sow give even-colored and shaped offspring. There are a few good Tamworths and Duroc Jerseys (red animals) shown at the fairs. One lot of mule-footed and of Hampshires are also in the state. The Hampshire is a black hog with a distinct white belt around his middle, while the mule-footed has a solid hoof instead of a cleft one. Neither of these distinctions make them any more valuable for pork making, but are fancied by breeders. As pork makers the half-bloods of these two last named have not been offered in number enough to make any records better than the Polands or Berks.

Fattening.

In many parts of California hogs are not carried to heavy weight but are turned off fat at a hundred and fifty to two hundred pounds. The actual feeding on grain has not been profitable except to a limited extent. The alfalfa pastured hog readily reaches this weight in nine months to a year. There are some favored places where there are by-products or special amounts of slops that make the fattening a simple and cheap matter. Egyptian corn is the usual fattening food the rancher uses with alfalfa. Eight or ten weeks on corn will finish the pork off nicely. If there is any skim-milk or buttermilk to be had, it helps in feeding whole Egyptian corn in the head. Water will do, however, if a little kitchen slops are added for flavoring and into every gallon a pound of middlings is stirred and poured over the corn. The loose leaves and broken-up pieces of alfalfa from the bottom of the barn should all be saved for the hogs. At night stir into ten gallons of water ten pounds of middlings or rolled barley, ten pounds of waste kitchen refuse or of the alfalfa from the bottom of the mows, turn this over fifty pounds of the Egyptian corn in the night time. Feed it in the morning and one pound of pork will come from every four pounds of solids in this feed. These weights are made by moderately well-bred pigs, those that have some good blood in them. The tule hog is, like the old razor back of the South, impossible to fatten. This little matter of blood makes it at first impossible for a man to tell exactly from how much feed he can make a given amoun of pork. After a bunch of hogs has been bred up for a term of years the amount of food will be much less than in a common lot.

Sows.

The raising of the young pigs depends on the amount of milk the mother furnishes them. This can be increased by careful feeding. The same slop is used, leaving out the Egyptian corn entirely. Corn does not make a good milk food for the sow, as it produces constipation. Citrons, melons and roots of any kind, keep the digestion of the sow active. Constipation destroys many young pigs every year; sometimes roots and melons alone will keep this regulated, but it is often necessary to feed the sow a half pound of oil cake meal a day. Whenever the three day old pigs look dumpy and act dizzy, the bowels should be looked to as the cause. In every pig yard a certain amount of bone-making material should be supplied, a box containing ashes, charcoal, sulphur and granulated bone with a little salt added. The proportions are not very particular. We take a forty-pound box and fill it full of clean ashes, then put into this several shovelsful of charcoal or charred bits of wood, a two quart can of sulphur, the same of granulated bone from the chicken yard feed box and a pint of coarse salt. Shovel it over to mix it up and put the box where the pigs can eat of it freely. Sometimes a box of soft coal is put in for them to eat.

These sound like queer dishes to serve the pigs, but they esteem them highly. The fact is a pig as a rooting animal in its natural state swallowed its peck of dirt monthly instead of annually.

Alfalfa.

In hog feeding, then, the one best and cheapest food is alfalfa. Alfalfa pound for pound when dried is as full of nutriment as bran. Alfalfa green or alfalfa hay may make all of a pig's food until time to fatten him for butchering. Then add sorghum or Egyptian corn instead of the Eastern Indian corn. The differences in these three as fattening foods are not great

Sound as a Dollar

That's the way to keep your horses. It's easy to do it with Kendall's Spavin Cure. Thousands of other horsemen have done it in past 40 years.

Cured Spavin

"Two years ago, I bought a pair of fine black mares. In about six months one had a Spavin. I simply **used your Spavin Cure, and cured her entirely**, which mystified all the horsemen.
Yours truly,
M. S. Culver, Union City, Conn."
Letters like the above are received by us daily from grateful horsemen.

Kendall's Spavin Cure

is the only safe, cure cure for Spavin, Curb, Splint, Ringbone, Bony Growths and all Lameness. Save your horses with the old reliable cure. Leaves no white hairs or scars. It is the world's best liniment for man and beast. **At druggists, $1 a Bottle; 6 for $5.** Ask your druggist for book, "Treatise on the Horse," or write to

enough to be of moment to the feeder. Feed with the grain enough roots, citrons, pumpkins or green alfalfa cut up to keep the digestion active. Fattening hogs should have at least three meals a day, all they will eat clean each time, feeding at regular times so that when their stomachs are full they will go and lie down quietly until the next meal time. When hogs are fed irregularly they rush to the troughs whenever a man appears around the yards. This is not good for fattening an animal; they should have as nearly a rest cure as possible. Certainly all idea that they have to squeal for dinner must be banished from their minds. Perfect peace and quiet will make them fatten up cheaply.—M. E. Sherman.

TRESPASSING STOCK.

In answer to query as to redress of owner of land as against owner of trespassing stock, Mr. Payne has given the following extended and complete information:

Trespassing Stock.

Senate Bill 630 introduced by Senator Gates for the purpose of amending Section 1 of the Act of 1907, so that the property owner might recover damages, although his property might not be fenced, never got beyond committee, and the law of 1907 is still in force, the practical result of which is to preclude a property owner from recovering damages caused by trespassing stock, unless the property is, at the time of the trespass, entirely enclosed by a substantial fence or other enclosure.

The property owner might proceed under the act of 1901 and amendments, which provides that any person upon whose lands an estray is found, may take up such animal, confine the same in a secure place, and within a week thereafter publish in some newspaper of general circulation, printed in the county, and also file with the county recorder, a notice containing a description of the animal with the marks and brands, and the probable value of the animal, and a statement of the place where the taker-up found, and where he has confined the same. The county recorder shall receive for filing the notice fifty cents; notice shall be published for two weeks. If, however, the animal has the owner's brand or mark upon it, which has been recorded according to law, or if the finder knows the owner, or the person having charge thereof, then, within five days after taking up, he shall notify the owner or the person having charge, with a notice in the same form as above specified; this notice shall be in lieu of publishing and recording. The taker-up is entitled to fifty cents for giving the notice. If, within thirty days, the owner claims the animal he shall pay the cost of recording and publishing notice; thirty cents per day for the keeping and care of each horse, mule, cow, etc.; ten cents per day for each sheep, goat or hog, providing that the person who has taken the same has properly fed and watered the animals while under his care.

There is also a provision for a pound district for any township where twenty-five residents petition for the same, the poundkeeper's duties being to take possession of estrays, and to have a lien on the same for expenses, and for the same amounts above specified.

If no one claims the animals within thirty days after filing the notice, or, if he claims the same but fails to pay, or fails to commence suit as in

The New 20th Century Harrow

Patented

This Shows a 3-Section (90 Teeth) Six-Horse Harrow

This unexcelled, improved, automatic, self-cleaning harrow, which can be operated by a twelve-year-old boy, is a great labor saving device.

The above illustration shows with what ease harrowing can be done by this method, as a riding cart is attached to our harrows, and the operator simply presses a foot lever when he desires to clean the harrow from rubbish, and then the harrow cleans itself automatically.

The old method of cleaning harrows, requires a great deal of strength and labor, as every farmer knows, and by nightfall the operator is exhausted, while with this new invention there is no strength or hard labor required.

Our standard seasoned oak frame harrow is five feet long, five bars to the section (30 teeth to the section), and as many sections as are desired can be used. The illustration also shows a rear action which may be desired by some farmers. This action is extra. It drops to the ground while the main harrow is in the air cleaning itself.

You can use the teeth from your old harrow, as we can supply the harrow complete without teeth. Holes for the teeth bored to order.

The self-cleaning attachment can be purchased separately and you can attach it to your old harrow. The riding cart can also be purchased separately.

This self-cleaning attachment can also be supplied for traction purposes. It is equally good for light and heavy work.

Any size harrow made to order. Write for prices.

Get 2 to 6 Lbs. More Milk per Cow a Day

From the Alfalfa You Feed

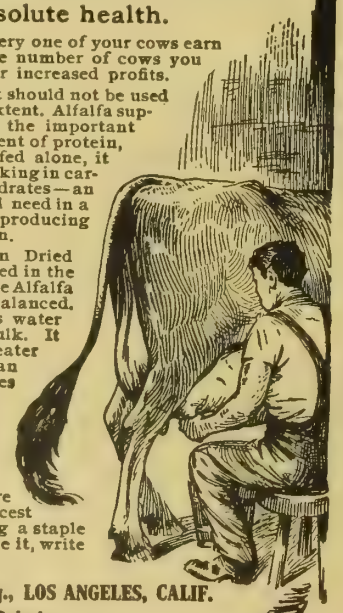
Alfalfa is a good milk producer—but you can feed it so as to get 2 to 6 pounds more milk per cow a day.

Your cows like it—but it can be made still more palatable. It is a healthful feed—but it can be fed so as to insure your cows being and keeping in absolute health.

Alfalfa fed with Steam Dried Beet Pulp will make every one of your cows earn $10 to $20 more a year. Multiply these figures by the number of cows you own and you can safely count the result as your increased profits.

Alfalfa is an unrivalled feed for the dairy cow—but it should not be used alone. Cows need variety. They are human to that extent. Alfalfa supplies the important element of protein, but, fed alone, it is lacking in carbohydrates—an equal need in a milk producing ration.

STEAM-DRIED BEET PULP
Just Like Roots
Makes More Milk



Steam Dried Beet Pulp is the ideal combination with Alfalfa. Used in the proportion of 8 lbs. to 15 or 20 lbs. of Alfalfa Hay—all the Alfalfa a cow will eat—gives a ration almost perfectly balanced. It is light, bulky, succulent, easily digested, absorbs water quickly and swells to about six times its original bulk. It is cheaper than bran or rolled barley, and it is a greater milk producer. Steam Dried Beet Pulp is the clean beets dried by steam as soon as the sugar factories have extracted the sugar. Be sure you get Steam Dried. It is uniform in quality and color, never burned or blackened by smoke, always clean and pure. Keeps indefinitely. For convenience in handling, it is packed in 100 lb. sacks.

Steam Dried Beet Pulp is also a splendid food for horses, pigs and poultry, and raisers are placing more and more dependence upon it as a feed for their choicest stock. Steam Dried Beet Pulp is rapidly becoming a staple product among feed dealers. If yours does not handle it, write us direct. We will see that you are supplied.

the act provided, then the taker-up shall notify a constable or any officer of the township or county in which said animal or animals is held; the notice shall specify that he has complied with the provisions of the act, that a claimant has failed to appear, or has appeared but failed to pay the expenses and has failed to prosecute an action for the recovery of the animals, and that such animal or animals are held for sale; the constable shall proceed to sell at public sale such animal or animals, in conformity with the law for executions, and shall be entitled to the same fees as under sales for execution. Out of the money realized from the sale, after paying fees, the constable shall pay the taker-up his expenses and costs as in the act provided, and the surplus he shall pay to the county treasurer for the owner. —Edw. L. Payne.

THE MAN AND THE COW.

Every instant that milk stands in the stable it gathers contamination.

An ill-tempered man is a misfit in the dairy business.

The gospel of clean milk is not a strainer gospel, but a gospel of prevention.

Men who will not obey the "please be clean" advice, should be subjected to sterner advice.

The man who produces pure, clean milk for the babies in the city has a clear conscience, clean hands and a pure heart.

The silo is the best solution of the problem of short pastures.

The silo helps solve the problem of making a profit from $100-an-acre land.

Well cured ensilage corresponds with the nature of the cow.

The ration should be balanced to meet the needs of the cow at all stages of lactation.

The economy of a ration depends not upon the actual cost of feed per day, but upon the cost of producing a pound of butter or milk.

Life is too short and too strenuous to make new breeds or to dairy with cows not of the dairy form and temperament.

Cows that do not possess the dairy form are unable to endow their progeny with the dairy temperament.

Early cut clover or alfalfa cured under caps and grown as thick on the ground as possible makes the best hay for dairy cattle.

The breeding-bull should not only be the son of a cow with a large milk record, but the son of the cow possessing the true dairy form.

A scientific education combined with common sense and a natural love for the cow is the foundation of success in dairying and getting together a choice herd of cattle.

There is no better system of feeding for milk than to give each cow a ration according to the work she is doing and to properly nourish her body. —Farm World.

FIGURING CAPACITY OF SILO.

A reader inquires how to figure the capacity of a round silo. Here is the formula: Square the diameter and multiply it by .7854. The product is then multiplied by the altitude, which gives the contents in cubic feet. The weight of a cubic foot of ensilage is figured at 40 pounds. A silo 14 feet in diameter and 24 feet deep is figured as follows: 14x14 equals 196; 196 x .7854 equals 153.9; 153.9 x 24 equals 3693.6, the cubic feet of the silo. Forty times 3693.6 equals 147,744, the pounds, or 73.8 tons, the contents of the silo.—Kansas Farmer.

Profit in the Poultry Yard

Practical poultry people who may have ideas from their experience as to methods of feeding and housing and general care of poultry will confer a favor upon the Cultivator and its circle of readers by sending in concise accounts. Mrs. Basley is always willing to answer queries, which with the experience of others should make this a most valuable feature in poultry life on the Coast. Opinions or matters of a personal nature should be omitted, but a concise statement of facts is always valuable.

THANKSGIVING TURKEY.

Mrs. A. Basley.

Thanksgiving Day has almost come around again, another year is nearly ended, the harvest time is past. It has been a good year, the harvests have been good, the prices above the average, and the whole country rejoices in continued prosperity, with a bright outlook for the future.

Thanksgiving Day is an American institution. No other nation holds a similar beautiful festival and no other nation has so many blessings, the gifts of peace, prosperity and liberty for which to render thanks to the Giver of all good gifts.

The turkey is the king bird of Thanksgiving Day and it is right for him to be the leading dish, for as Thanksgiving is an American institution, so the turkey is preeminently an American bird, the largest of American game birds, indigenous to this country and now the largest and most profitable of domestic fowls.

Every year we hear of a shortage in the turkey market on or about Thanksgiving time and the prices rise year by year until now they are almost prohibitory. At the prices which have ruled for turkeys in recent years they are much more profitable than hogs, sheep or cattle. With proper care turkeys are not difficult to raise. They require close attention for only a few weeks after they are hatched, and that attention is merely to keep them from getting damp from dew or rain, and not overfeeding them or giving them corn when quite young. After that time they are perfectly able and more than willing to forage for themselves and will find the larger part of their living in the fields, gleaning every scattered grain that would otherwise be lost, and making dollars for their owners by feeding off pernicious insects and waste grain or weed seeds. A farmer's wife who has a big crop of turkeys to sell about this time of the year will reap a golden harvest and have spending money for Christmas. Of all our domestic fowls the turkey is the leader as far as profits are concerned and I wonder that many more are not raised on the Pacific Coast.

Preparing Turkeys for Market.

Turkeys which have been on the range during the summer months should as the fall comes on and the insects and grains disappear be fed some grain to bring them home at night, and to send them to bed with a full crop. Turkeys do not bear confinement with any degree of patience, and if shut up soon begin to lose flesh and may in a short time be almost skeletons. They need liberty, or at any rate partial liberty to do well. They do not stand the stuffing process for more than ten days.

In the first place the turkeys should have had plenty of sharp grit and oyster shell to furnish the material from which to make large bone and also should have been kept free from lice. All summer long and into the fall they have devoured the insects and grasshoppers but with the chilly fall weather these are becoming scarce, the weed seeds are ripening while nuts and acorns are falling, for nature is providing with a liberal hand for the necessary winter fattening.

There is a flavor belonging to the meat of a range-fed or wild turkey that cannot be found in one raised in confinement or even in a barnyard, for necessarily the food cannot be so varied and wild berries and nuts, the seeds of the pine cones, the beechnuts, hazelnuts, acorns, berries and spicy seeds impart a flavor not to be excelled and the turkeys fed on these are toothsome enough for the most epicurean appetite. All that a free range turkey may need is a feed of hard dry corn at night.

For turkeys on limited range or on range that may be bare of insects, nuts and berries, we may have to assist nature and substitute for her fare the best we can find and undoubtedly that is good hard corn a year old, so as to be thoroughly ripe and dry, for there is something in new corn which is apt to disagree with turkeys. When turkeys can be kept in an olive yard, or a sweet apple orchard, a little corn at night is usually sufficient for fattening them.

Turkeys that have not the advantages of freedom can be successfully fattened in a yard. The way I feed is to take two parts of corn and one part of barley, soak over night and in the morning put on the stove to boil, let it cook slowly until it begins to soften, then set aside, covered till supper time, when it will be cool enough to feed, give this three times a day as much as the turkeys will eat up in about fifteen minutes, then remove till next meal time. I add a chopped onion at supper time as that is a stimulant to the liver and the digestion. Fresh water must be kept before them at all times.

Boiling the corn removes whatever it is in the new corn that disagrees with the turkeys. One year I had excellent success in fattening turkeys by feeding them the same food as for fattening chickens, that is, equal parts of heavy bran, corn meal and oatmeal (rolled breakfast oats) mixed with sour milk or buttermilk, three times a day.

In fattening turkeys begin by feeding only once a day and gradually increase. Do not fatten the turkeys that you intend to use as breeders for the fat weakens the organs of reproduction in both sexes and the offspring will be weak and small or the eggs will be infertile. This I have found almost invariably the case where people have had me investigate the cause of eggs not hatching or the poults being weakly, the parents had accidentally been fattened at Thanksgiving time and the next spring the eggs were weak.

When turkeys get sick from being fed for market, it usually shows a lack in the constitution and is often the result of a slight attack of liver trouble which they had seemed to get over in their early life. The best thing would be to turn them out on the range again or to doctor them by giving them a dose of epsom salts and then following it with ten drops of tincture of nux vomica in a pint of water, allowing no other drinking water. Then give freely of chopped onion mixed with bran and eat them as soon as possible. Do not breed from those turkeys, for though they may be perfectly well they will not breed a vigorous constitution into their offspring.

Turkeys should be kept twenty-four hours without food before killing. They may have water but no food, this is to empty the crop, gizzard and bowels and prevent the food which would remain in them from souring and giving the whole carcass a bad flavor.

Roast Turkey.

Remove all the feathers carefully, singe over a burning newspaper on top of the stove; then draw it nicely by first cutting the skin down and across the back of the neck so you can draw the crop out and cut off the head, and tie the neck close to the body by drawing the skin over it. Now rinse the inside of the turkey out with several waters and in the next to the last mix a teaspoonful of baking soda; often the inside of the fowl is very sour, especially if it is not freshly killed. After washing wipe the turkey dry inside and out with a clean cloth, rub the inside with some salt, then stuff the breast and body with some "Dressing for Fowls." Sew up the turkey with a strong thread, tie the legs and wings to the body, rub it over with a little butter, sprinkle over some salt and pepper, dredge with a little flour; place it in a dripping pan, pour in a cup of boiling water, and set in the oven. Baste the turkey often, turning it around occasionally so that every part will be uniformly baked. A fifteen-pound turkey requires between three and four hours to bake.

Dressing for Fowls.

Take a pound loaf of bread. Put

COULSON'S CHICK FOOD

COULSON'S EGG FOOD

Pillars of Strength

—IN—

Poultry Raising

Coulson's Chick Food is carefully prepared with due regard to the delicate mechanism of the little chick. It is rightly proportioned, properly ground and composed of properties upon which the little fellows can live and prosper. It will save your chicks and put them on the road to a commercial return for their owner. INSIST ON GETTING COULSON'S CHICK FOOD IF YOU WANT THE BEST.

Coulson's Egg Food is a most wonderful foundation for liberal egg production. It is **not** a stimulant. It is the egg itself. The hen transforms it into the egg of commerce. By feeding Coulson's Egg Food you simply give the elements from which she builds her eggs. Analysis will show this. SUCCESSFUL POULTRYMEN USE AND RECOMMEND COULSON'S EGG FOOD.

When writing **advertisers,** mention Cultivator.

it into a suitable dish, cut in slices and pour cold water over it (not warm for that makes it heavy). Now take up a handful at a time and squeeze it hard and dry with both hands, placing it as you go along in another dish; this process makes it very light. When all is pressed dry, toss it all up lightly through your fingers. Add pepper, salt,— about a teaspoonful,— also a teaspoonful each of powdered summer savory, sage and parsley; add half a cup of melted butter and a beaten egg. Work thoroughly altogether, and it is ready for dressing. A little chopped sausage in turkey dressing is considered by some an improvement. Oyster dressing is made with the same ingredients as the above, with the exception of half a can of oysters slightly chopped and added to the rest.

Cranberry Sauce.

One quart of cranberries, two cupfuls of sugar and a pint of water. Wash the cranberries, then put them on the fire with the water, but in a covered saucepan. Let them simmer until each cranberry bursts open; then remove the cover of the sauce pan, add the sugar and let them boil twenty minutes without the cover. The cranberries must never be stirred from the time they are placed on the fire. This is an unfailing recipe for a most delicious preparation of cranberries.

A PLEA FOR PURE BREDS.

How many visitors at the recent fairs contracted a more or less severe attack of "chicken fever;" how many have since purchased a few birds and are now deep in poultry culture? Of those who were keeping poultry before there are sure to be a large number who gained enthusiasm for their work and went back home with better "heart" for the duties in the poultry yard.

Breeders of mongrel fowls are very apt to feel a dissatisfaction with their multicolored flock when looking over the pure breds in the coops, and feel a desire for something of better quality than they have at home. This is the best time of the year to get good stock at a reasonable price. Breeders are glad to sell stock now for much less than in the spring in order to make room and save feed.

It is rather strange, when one thinks of it, that the opportunity to get pure bred stock at a reasonable price is not more often taken advantage of. When a breeder has spent years, and not inconsiderable money, in bringing a flock up to a high grade of perfection, he has something that, strictly speaking, money does not pay for, and yet some people insist that "a chicken is a chicken." In making a plea for pure bred fowls, we cannot say they will take care of themselves, be free from vermin or stand abuse any better than mongrels. They will eat just as much if given the opportunity. But any flock of pure breds is far more attractive in appearance than a mixed flock, make a more uniform lot on the market. Having the same characteristics, they make much more uniform growth and, as the variety may be large or small, respond to care and feeding in the same general manner.

We have yet to see a flock of mongrels that will average in weight with any of the heavy or even general purpose breeds. Of course, if there has recently been a cross with a large variety, the result will be birds of much larger size. This, however, would not be strictly adhering to the principles of mongrel breeding, if principle it might be called.

Occasionally one hears of very creditable feats performed by a flock of mongrels. Perhaps they have outclassed a flock of the neighbor's pure breds. The owner at once condemns pure breds and extols his own mixed lot. Was this due to the fact that they were mongrels? Never. Give that man a flock of pure bred birds of the same age, and let him give them the same care, and then we'll see which flock responds most kindly to proper care and surroundings.

Is there no satisfaction in having pure bred stock of any kind on the premises, no matter whether it be sheep, horses, cattle or poultry? Shall we take no pride in anything? And, what is of still greater significance, will we not give more attention to any object in which we take great pride? Profits may be reached in proportion to the intelligent care given the fowls. Then if a pride in our possessions leads us to give them better care by all means let us possess something of which we can be proud.

Look over any flock of pure bred birds, black, white or parti-colored, and if their uniformity of size and color is not pleasing to the eye, there is something wrong with the organs of sight. Better visit an oculist.—Poultry Tribune.

CALIFORNIA POULTRY SHOWS.

Petaluma.—Dec. 6-9, 1911. Petaluma Poultry Association. H. R. Campbell, secretary.

Napa.—Jan. 4-6, 1912. Napa County Poultry Association. Wallace-Rutherford, secretary.

Santa Ana, Dec. 27-30. Orange County Poultry, Pigeon and Pet Stock Association. S. J. Jackman, President.

San Diego. — January 12-18, 1912. The Fanciers Club of San Diego. V. Davis, Secretary.

Los Angeles.—January 4-10, 1912. Joseph E. Davis, Secretary, R. D. 1, Box 48, Los Angeles.

FRESNO SHOW.

John F. Forney of Kingsburg is pushing, with Secretary Andrews of the Fresno Poultry, Pigeon and Pet Stock Association for a big show in Fresno, December 12-16. The Fresno show has drawn some of the best birds in California for several years, and we doubt not the Central California poultrymen will gather in numbers and exhibit more and better birds than ever before. Those desiring information may write to Mr. George R. Andrews, Secretary, at Fresno.

When hens fly and cackle and you cannot see anything to disturb them, set a trap in some protected corner and you will be likely to catch a rat.

Cabbage is one of the very best vegetables to feed to poultry, as it keeps green a long time and the hens enjoy picking at it. Hang it where they can get at it readily without scattering it about or soiling it.

MOLTING.

A great deal is being written in the poultry and farm papers, especially at this season, regarding the molt. Some advise forcing the molt, while others do not believe in it. But it is generally accepted that it is best to assist nature and feed a food that will be suitable for the formation of feathers and the general building up of the systems.

If we wish our flock to come through the molt early and uniformly we can accomplish it very easily. The method is to withhold part of the feed for about three weeks, feeding principally of vegetables and green food, lawn cuttings, etc., and leaving out the grain and meat ration.

After you have had your birds on this ration for about three weeks you will find that they have lost much flesh and are very thin. Then you should feed a rich, nitrogenous ration, either a good molting food or one consisting of beef scraps, corn, wheat and before they are ready for market. The best money makers are the birds that feather quickly and are quickly ready for market. A medium sized male with large hens will give an earlier maturing, better shaped bird than an overgrown male with small hens. To keep hens up to the standard weights it is necessary to breed from females rather over the standard weight.—Wallace's Farmer.

If the chickens seem sluggish, disinclined to eat, drink or move, examine the droppings for worms. Thirty drops of turpentine, or half a teaspoonful, to a pint of water, kept before the birds for a week in place of the regular drinking water, will cure ordinary cases. A tonic in the shape of onions, or any good poultry tonic, will tone up the birds. Clean and burn the droppings or plow them under.

Do not allow the young chickens to

THANKSGIVING.

Thanksgiving! Thanksgiving! November is here,
The beautiful crown of the wonderful year!
Like doves to the windows from East and from West,
The children come back to the cozy old nest.

Thanksgiving! Thanksgiving! the old folks at home
Are so glad by the fireside to see them all come
Though the forties and fifties are silvering their hair,
They are boys yet and girls to the good people there.

Thanksgiving! Thanksgiving! sit down by the fire,
Talk over old times with the happy old sire;
Tell the mother, whose hair is like new-fallen snow,
That you love her no less than in days long ago.

Oh, the home—the old home! The new may be sweet,
But not like the old to the world weary feet;
Be it long ere the hearth-light shall fade from its walls,
And the cheerful old love-light go out in its halls.

Imperial Valley Turkeys.

eats, with a little linseed meal, alwaysbe crowded. Remember that they have giving plenty of fresh water and good harp grit.

Birds treated this way and kept free rom lice will come through and molt etter and will begin to lay earlier and e in better condition than those that re left to drag through the molt.

BUYING A BIRD.

The purcahse of a male for a flock f mixed chickens is not a matter of nportance to the farmer; if he can et what he wants by "swapping," so nuch the better, but when the owner f a flock of pure bred fancy chickens ishes to buy a male he begins by ooking up his breeding. What he is kely to breed, what his faults are, is e the only one of quality in the breedr's yards, the chance result of a nance mating, or is the strain from hich he comes prepotent in the line e buyer needs to strengthen, are imortant questions. Take time in buyg a breeding bird by mail, ask all e questions you wish, tell wherein our birds are lacking. The farmer is eginning to pay good prices for birds, nd he should get good quality for his oney.—Wallace's Farmer.

Don't keep leggy, over sized cockels for breeders next year. Such rds are slow in maturing, slow in athering, and cost too much for food grown considerably since you gave them their first hovering and roosting places. Spread them out a little and give them plenty of room to grow.

Often the seeds for sickness are sown by allowing the young stock to be overcrowded and overheated at night. If they are too warm during the night they will take cold some cool morning when they come out early.

Ducks, geese and guineas are as good as a watch dog to give an alarm of approaching strangers. They are more profitable, too, because the food they consume is converted into salable products.

TABLES TURNED.

Alfred had so often been asked by admiring strangers "Whose little boy are you?" that it was perhaps no wonder that he finally turned the tables on his elders. This he did one evening by inquiring, very sweetly, of a young gentleman who was calling upon Alfred's sister, "Whose papa are you?"—Harper's Weekly.

BAD CASE.

"Why do you borrow trouble?"

"Don't you know?"

"Looks foolish to me."

"It is because I can't borrow money."

AFTER THANKSGIVING.

"What did you do on Thanksgiving?"

"Oh! I had a glorious time! I was helped three times to turkey."

"So was I."

"And twice to ice cream, and I had a quarter of a mince pie, and a lot of custard."

"I had pumpkin pie, and custard pie, and mince and apple turnovers. Then I had nuts and raisins—"

"So did I."

"And candy."

"So did I."

"And next day I had the doctor."

"So did I!"

IT'S COME TO THIS.

Mrs. Corntossel (reading letter)—"I declare, Jabez, I call this downright cruel."

Farmer Corntossel—"What's the matter?"

Mrs. Corntossel—"Why, here's a letter from Amelia tellin' me she gets help in raisin' her children from a Mother's Club. I do believe in a slipper sometimes, an' a good birchin' don't do a child no harm, but I never used no club on my children."

Lee's Egg Maker

Are your hens laying *now?* If not, are you doing your part in furnishing proper feed. Protein—*digestible* protein—is the feeding secret. It's a simple matter to get food rich in protein, but the percentage of it that is *digestible* is the thing to consider. Lee's Egg Maker is almost a pure meat product, clean, sweet, and wholesome, and contains more protein in *digestible* form than any other meat product. Successfully replaces all other kinds of meat food at *less* feeding cost and better results. That's our *guarantee.*

Prices 25c to $7.00, according to size.

GERMOZONE

is the best health-insurance you can furnish your fowls. Indispensable as a remedy for *Roup, Colds, Chicken-Pox,* and other poultry ailments. Disease in your flock now will probably mean diseased birds all winter and poor breeders in the spring. Germozone twice-a-week tones and builds up the system, destroys disease germs, insures better and healthier stock *now* and strong, vigorous birds for the breeding season. Best guarantee *against* disease; surest remedy if disease has already taken hold. *Either tablet or liquid. Price 50c.*

Lee's goods are on sale in almost *every* town, but if yours is an exception send your order direct to us and ask for our *free* offer.

GEO. H. LEE CO.,
225 W. 2d St., Los Angeles, Cal.

Send for your *free* copy of Lee's New Poultry Book. Interesting; instructive. The "best yet."

TRAPPERS GET BUSY
BIG MONEY IN FURS

Over ten million dollars will be paid to trappers of fur bearing animals during the coming winter. Any man or boy living in the country can add a goodly sum to his earnings by trapping during spare moments. We furnish ABSOLUTELY FREE a complete Trapper's Guide which tells you the size of trap and kind of bait to use for the different animals, how to remove the skins and prepare them for market. We also furnish the best traps and baits at lowest prices. We receive more furs direct from trapping grounds than any other house in the world, therefore can pay the highest prices for them. Our price lists, shipping tags, etc., are also FREE for the asking. If you are a trapper or want to become one, write to us today. We will help you.

FARM LANDS FOR SALE.

For Sale—

A FINE COUNTRY HOME.

75 acres—20 acres alfalfa land, some alfalfa planted, all under cultivation. Good six-room house, big barn, 24x50, with stable full length on each side; windmill and tank. Water piped to house and barn and chicken corrals. Lots of shade and flowers; 8 acres vineyard; picked 24 tons grapes this season. Large well and gas engine for irrigation, 5 H.P. This alone is worth the price asked, but the owner will for a short time throw in 4 work horses and harness, 2 cows, 1 heifer, 250 chickens, 1 heavy wagon, 1 light wagon, 1 covered buggy, plows, harrows, and, in fact, all farming tools. Hay enough to carry stock through till harvest; 25 bushels corn and 25 bushels wheat, and other things too numerous to mention. Family orchard on the place. Only $8000; ½ cash, balance to suit. This is an income from the start. F. J. Conrad, The Hustler, Escondido.

For Sale—LINDSAY ORANGE LANDS.

Eleven days before Christmas the fourteen packing houses of Lindsay sent out pay checks for the 1910 navel orange crop. Lindsay orange district had the holiday orange market all to themselves, and of course they sold at good profit.

Why not invest in some of this Lindsay orange land and get the benefit of rapidly advancing prices?

Ten-acre tracts in Lindsay, $150 per acre, on easy terms.

Choice Tulare alfalfa lands, water in abundance; any size tracts, $50 per acre up.

KIOUS-WHANN REALTY CO.,
235 Mason Bldg., Los Angeles. A4164.

For Sale—700 acres land, 42 miles of Los Angeles. Plenty of good well water for domestic use; some running water on the land, and I believe plenty of water can be obtained to irrigate all of the tillable land, about 500 acres; about 200 acres fenced. I will take $35 per acre, one-third cash. I have 29 cows and heifers and 48 other young cattle, including calves. I will sell a pick of 20 out of the 29 cows for $50 per head, or I will sell the 77 for an even $2000. I have other personal property, viz.: Bees, mules, pigs, chickens, and farm implements. J. E. Youngblood, Lang, Cal.

$17.00 Per Acre—880 Acres. 880 acres A-1 citrus, grain or stock ranch, 8 miles south of Escondido, in line of new electric road now building; ½ mile from boulevard. Five-room house, barn, sheds, etc.; good well. Creek runs through place; 700 acres can be cultivated. This ranch is just across the road from land selling at $75 to $150 per acre. This is a bargain. Charles Soults, Escondido, San Diego County, California.

170 Acres—¼ mile from R.R. station and school, $30 per acre. 100 acres in crop; more can be planted to trees or vines. Partly warm citrus soil or for winter gardening; some alfalfa land; well 50 feet deep, 10 feet across, water 8 feet from surface; all under fence; no other improvements. Terms $3000 cash, balance at 7 per cent; will not trade. Address C. T. Haney, Escondido, Cal.

For Sale—3-acre chicken ranch in city limits of Paso Robles, banking and railroad town; good 5-room cottage, barn, incubator, brooder and all kinds of chicken fixtures, well, mill and tank; fenced. Land level, good soil; 15 minutes' walk to business center; price $3000; easy terms if desired. W. L. Carter, owner, 432 Byrne Bldg., Los Angeles.

Choice Orange Land, Exeter District—63 acres, 3 miles south of the town of Exeter, California, three-quarters of a mile from Southern Pacific railroad station, right in the foothills, leveled, water developed on it. Write for particulars. The Phalanx Company, 513 Chamber of Commerce, Los Angeles, Cal.

A LETTER FROM GREECE.

Mr. Fred Hammer, Southern California ent of the Frost Prevention Company, an interesting proof of the worth of tivator advertising. It is a postcard m M. Triantaphllidis, Athens, Greece, ing for catalogue and information as possibilities of frost prevention by the of his oil pots. The Cultivator's long is often successful in reaching far- y people for its advertisers, and here- re we have been shown proof of its ching power in Southern Africa, in an, in England and Australia. he Frost Prevention people report an ellent season; many who formerly did believe in oil pot protection, after ng tests, have placed orders for thou- ds of pots.

A PERTINENT INQUIRY BY ABRAHAM LINCOLN.

In 1858 we heard Abraham Lincoln deliver an address at the Wisconsin State Fair in Milwaukee. The address made a deep impression upon us at that time, but we now see that we failed to comprehend its deep and true import.

Lincoln was not a farmer, but his far-seeing mind reached out and grasped then the living issue of today, the issue that is crowding itself upon farmers everywhere. Read the following extract from that address and note how Lincoln's mind grasped the true essence of economic farming:

"Unquestionably it will take more labor to produce fifty bushels of wheat from an acre than to produce ten bushels from that same acre; but will it take more labor to produce fifty bushels of wheat from one acre than five? Unquestionably thorough cultivation will require more labor to the acre, but will it require more to the bushel?"

That was a center shot; it went straight to the very core of the whole farming question. Right there lies the dividing line between the old, wasteful methods of land destruction, going on yet, and the reform in ideas and practice that modern farming would bring about. Right in that brief inquiry by Abraham Lincoln, fifty-two years ago, lies the very essence of what the modern agricultural college, the modern farm paper and modern science are trying to get the farmers of this country to see.

Go back and read that great inquiry over. Let it saturate the thought and understanding. "Will it cost more to raise fifty bushels of wheat on one acre than on five?"

Will it cost more to produce 18,000 lbs. of milk from three cows than from six?

Because the past generation of farmers of this country have been blind to this great economic truth, have they destroyed the fertility of their soil, and gone to their graves "unhonored and unsung." The demon of waste, that would rather grow fifty bushels of wheat on five acres than on one, because it could be done with less outlay of brain, wouldn't take so much thinking. This malign spirit has been the presiding genius of American farming until within the last twenty years. We may say Lincoln saw this huge spectre of folly more than half a century ago. And yet there are thousands of farmers who can not see it today. They are still worshipping at the shrine of this moloch of waste and destruction.—Hoard's Dairyman.

U. S. ARMY TESTS MOTORCYCLE.

From Madison Barracks, New York, comes the information that Uncle Sam is to make a coast-to-coast test of motor cycles under the direction of the war deparment. Other countries are making use of the motorcycle in their armies, and in this country the militia in several states has already used these machines successfully for scouts and dispatch bearers—where swift and sure communication is necessary.

The army test will take a motorcycle squad from New York to San Francisco, via St. Louis, Oklahoma City and El Paso.

Young trees will grow later in the fall than the older ones, and the sap run should be checked early.

Exeter, Tulare County, shipped four cars of oranges to Australia last week.

Lettuce, to be at its best, should be grown as rapidly as possible; hence

AUCTION

THE BIG SALE OF THE YEAR.

400 Fine Dairy Cows and Horses.

The property of the Bonnie Brae Dairy, near corner of South Park and Manchester Avenues, Los Angeles.

Tuesday and Wednesday,
Nov. 28th and 29th, 9 A. M. Sharp.

200 Fine Dairy Cows—Mostly large, fine Holsteins, many fine Durhams and Jerseys, many now fresh and giving large quantities of milk; others coming in soon; nearly all young and in fine condition—in fact, one of the best dairy herds in Southern California. Many cows in this herd will milk from 50 to 65 lbs. of weighted milk when fresh.

150 Fine Heifers—Mostly Holsteins, a few choice Durhams and Jerseys, from 6 months to 2 years old. 5 fine young Holstein bulls, 1 young thoroughbred Jersey bull.

40 Head All-Purpose Horses and Mares—Weight from 1000 to 1200 lbs. each, 4 to 7 years old, good drivers, delivery and all-purpose stock.

10 Head Mules—Weight 900 to 1000 lbs. each, all young, all-purpose stock; 1 fine Shetland pony, harness and buggy; 1 fine 4-year-old trotting-bred stallion, weight about 1000 lbs.; very fine individual.

$3000 Milk Route and Implements. All stanchions, 3 bunk houses, milk house, Milk wagon, separators, aerator, cans, tools, etc. 500 ton ensilage in silos.

Everything must be sold, regardless of price.

The cows and all the young stock that can be sold will be offered the first day. Horses, implements and any remaining cows and heifers will be sold second day. If you are a dairyman, don't miss the sale of the year. We do not know of any other such herd in California. You are requested to visit the ranch prior to sale and see this stock milked daily at 2 p. m. Remember, sale starts at 9 a. m. each day. Arrange to be there on both days.

Mr. Litland will soon leave for Europe, is quitting the dairy business, and has instructed us to dispose of this magnificent dairy herd on above dates, without reserve.

Take Redondo-Moneta cars to Manchester Ave., walk 2 blocks east, or take 61st St. city cars to South Park Ave., walk south to dairy, or take Watts Local cars to Graham Station, walk west to dairy.

You are invited to attend this sale and partake of the old-fashioned free Spanish barbecue.

TERMS: On cows, $100 and under, cash; over $100, eight months' time, with note and approved security and 8% interest. Liberal discount for cash. Horses sell for cash.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper, and sign full name and address. Unsigned communications receive no attention.

Freezing Fruit.

What is the usual minimum temperature in the vicinity of Riverside, and what is the minimum citrus fruits will stand without damage?—Subscriber, Orland.

We cannot give the minimum temperature at Riverside and if we could it would give but slight idea as to its desirability as location for citrus fruits. It must be borne in mind that minimum temperature is no sure criterion of adaptability to citrus growing. There are sections of Riverside in which one would not be justified in planting a citrus tree and there are others which offer practically perfect conditions. We have seen the temperature fall to as low as 22 degrees in a bearing orange grove. This was near midnight. A breeze started and the temperature rose and before morning the freezing point, or 32 degrees, was reached. There was no perceptible harm done to the fruit, but had the temperature remained at 22 degrees from midnight to morning and then the sun had come out bright, doubtless every orange the sun struck would have been ruined. Amount of moisture in the atmosphere, condition of the tree, as well as conditions above mentioned, must be considered in determining possible frost injury.

Galls on Willows.

A subscriber living in the Arroyo Seco of Los Angeles sends leaves from willow trees with little red galls, some of them as large as the half of a pea. These galls seem to be a natural part of the leaf, but when opened are found to contain larvae. They were sent to Prof. H. J. Quayle and he answers:

"The willow leaves which were sent in are infested with galls produced by saw flies. These saw-flies belong to the same large group of insects as the bees, ants and wasps. One genus which produces this characteristic sort of gall goes by the name of Pontania, and such galls as this are called Pontania galls. When you ask what causes the particular growth, you are propounding a difficult question which at the present time cannot be answered specifically. It is due to an abnormal or hypertrophied growth of the tissue, induced by the egg puncture or growth of the larva. Some think that this growth is due to a secretion and others to a physical irritation caused by the movement of the larva. There are numerous other kinds of galls produced by many different sorts of insects as well as mites and fungi. The adult of the particular insect in question, deposits its egg in the tender leaves of the willow in the early spring. The larva grows and matures within the gall and by this time has eaten out most of the interior, leaving it hollow and filled with grass. Growth is completed by fall, usually in September, the larva then going usually into decaying wood, sometimes in the ground, and occasionally remaining in the gall itself to transform to the pupa and finally to the adult. It remains, however, as a fullgrown larva throughout the winter, transforming to the pupa and then into the adult in March. If you desire the species name of this Pontania, I shall be glad to determine it for you if possible, upon the receipt of better material."

Stick-Tight Fleas.

Please inform me how to get rid of stick-tight fleas on chickens. They seem to be only around the head where there are no feathers. They stick around in bunches. I have to pull them to get them loose. The hens are laying, but probably will not long, with fleas on them.—Subscriber.

To get the fleas off the bodies of the hens the best thing I know is to get some corrosive sublimate dissolved in pure alcohol and carefully paint the spots where the fleas are, but this is a difficult thing to do carefully, as the corrosive sublimate is very poisonous and if it runs into the eyes will make the hen blind, so I would advise trying either salt and alcohol, or salt and vinegar and an old toothbrush, and brushing the fleas or putting a very little coal tar on the spots. The only way to get entirely rid of the fleas is to spray the houses and yards with salt and water, especially in the corners, to kill the young broods of fleas, or you can pour boiling hot soapsuds or limewash or hot salt and water in the corners and dusty places. The fleas will kill young fowls and will prevent the hens from laying.—Mrs. A. B.

Black Scale.

What is the proper time for fumigating black scale on orange trees? Am told that if it is done after the scale is "housed up" for the winter that it will not kill. Fumigators are busy in orchards now. Is it too late for the work or not?—Subscriber, Covina.

It depends much upon the season, but fumigators generally regard the season as from October through December. After January 1st the eggs under the old shell are very hard to reach.

Jerusalem Artichokes.

When is the proper time to plant Jerusalem artichokes, and how long does it take for them to mature?—J. L., Grub Gulch.

Prepare the ground and plant much the same as potatoes, having rows four feet apart with two or three feet between plants. If tubers are small, plant entire; if large, cut to two eyes. Put about four inches deep. Cannot give the exact length of time for ripening the crop, but spring planting has the product ready for early fall harvest.

Pyrethrum.

I notice in the issue of the Cultivator of September 21, Page 274, "Insecticide Ruling," you speak of a "certain species of chrysanthemum." It will be of interest if you will print the botanical name of that species with description so one could recognize the plant.—Subscriber, National City.

From Bailey's Cyclopedia of Horticulture we quote: "The insect powder known as 'pyrethrum' is produced from the dried flowers of C. cinerariaefolium and C. coccineum. The former species grows wild in Dalmatia, a long, narrow, mountainous tract of the Austrian empire. 'Dalmatian insect powder' is one of the commonest insecticides, especially for household pets. C. cinerariaefolium is largely cultivated in France. C. coccineum is cultivated in California, and the product is known as buhach." In addition, the follow-

M. Bassett *Hanford, Cal.*

ing botanical description of C. coccineum is given: "Glabrous, ½ foot high, stem usually unbranched, rarely branched at the top; leaves thin, dark green, or in dried specimens dark brown; involucral scales with brown margin; rays white or red in such shades as pink, carmine, rose, lilac and crimson, and sometimes tipped with yellow, but never wholly yellow."

Balanced Ration.

Please give information as to balanced ration for brood sows, young sows and pigs two months old.—Subscriber, Earlimart.

We refer the inquirer to Mrs. Sherman's article in this issue.

Pigs per Acre.

Would like information regarding hog raising in Chino district. Have plenty of water, perfect stand of alfalfa. What are the conditions and how many brood sows per acre will this land carry? What breed is best for this locality and how long is it necessary to feed for market?—Subscriber, Chino.

The above and a number of other questions asked by the inquirer are answered in Mrs. Sherman's article in this week's issue.

Temperature for Valencias.

The theory that the Valencia will stand more frost than the Navel with less damage to fruit or tree has been advanced. Is there any record on this point?—E. W. M., El Cajon.

Dr. J. Eliot Coit answers: "At one time it was my opinion, based on observation, that the Valencia was more resistant to cold than the Navel, but of late I have come to believe that the difference, if any exists, is very slight and is hardly worth while to take into account in practical orchard plantings. It would be interesting for the Cultivator to call for testimony on this point."

Curling Citrus Leaves.

Leaves on Washington Navel trees planted this spring dry, then curl. Is it caused by hot winds or is there a disease of the citrus family which causes this?—Subscriber, Orland.

Dr. J. E. Coit answers: "There are two common causes for the curl of citrus leaves. One is aphids which attack the young growth early in the spring, affected leaves remaining cupped or curled up throughout their existence. The other cause is extreme heat coinciding with the lack of water. If a hot wind occurs just before irrigation many of the outside leaves will curl to such an extent that they will not entirely recover after the application of water. I know of no specific fungus disease which causes a curling of citrus leaves."

Remember that where there is no filth there will be no flies. Clean up your own premises. If you still have flies it is because your neighbors are harboring filth. If they won't clean up ask the board of health to force them to do so. That you are not safe from disease carried by flies unless your grocer, your butcher, your baker —everyone from whom you buy foodstuffs—is as careful as you are. See that your town has a food-screening ordinance, and that it is enforced.

WHY HE OBJECTS.

"We all have our share of trouble."

"You bet. But there is this about that I don't like."

"What is it?"

"Some of my friends think I ought to have theirs too."

NECESSARY.

"He has a lot of conceit."

"He needs it, don't you think?"

"Why?"

"To counterbalance what the rest of us think of him."

Veterinary

Answers in this column by Fred G. Matthews, M. S., D. V. M., 1232 Central Ave., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Throat Swollen.

What manifestations may be expected when beards of foxtail or barley settle in the flesh of the throat of a cow? What are the symptoms following the bite of a poisonous snake or insect and how soon after cow is bitten may the milk be used. —Subscriber, Kerman.

The condition will vary with the extent and depth of the injury from beards. Slight injury to the lining membrane of the throat or mouth will be accompanied by a flow of saliva, sometimes containing pus and having a foul odor and soreness of the throat. Beards penetrating the muscular tissue result in a swelling which tends to abscess formation, erupting in the course of four or five days, the pus which escapes having an offensive odor. So long as beards remain in the tract pus will continue to flow but the swelling will subside.

Swelling is profuse and rapid after venomous bites, starting from the point of injury, the swelling rapidly spreads to involve an entire limb or the head and a portion of the neck within a few hours. Pain is intense and weakness progresses almost to complete prostration and death. A dark bloody fluid oozes from the small wound inflicted by the fangs of the snake, and the poisoned flesh may decay and slough away after a few days. Abscess formation is not to be expected. When all swelling has disappeared and wounds, if any, have healed, the milk will be fit for use.—F. G. M.

Garget.

A cow five years old which calved last December commenced to give bad milk October 24; delivered a calf prematurely October 28; passed the afterbirth and is now all right excepting a caked bag. I milked her three times a day and rubbed the bag with camphorated oil at each milking. I can get milk from three teats, but the other gives but a little hard curd and this teat seems to have a hard core in it. Can I save the udder?—Subscriber, Vorden.

It is questionable if the worst teat may be saved, though not impossible. Apply iodine petrogen freely twice daily and rub thoroughly. A pad of cloth heated and suspended in a manner to cover the udder, after treatment, would greatly facilitate the absorption of the drug. Iodine in this form does not blister.—F. G. M.

Nymphomania.

A heifer which has been milking for the past six months has been in heat continually for about one month, and a swelling has appeared over the kidneys. Can anything be done for her. —Subscriber, El Centro.

Disease of the ovaries is undoubtedly the cause of the trouble. Dissolve two ounces of potassium iodide in a pint of water and give the cow two tablespoonfuls (one fluid ounce) twice daily in water or in the feed. Skip a week and repeat.—F. G. M.

EXPLAINED.

Visitor: "Great Scott! Why are you throwing bottles at that poor man? Are you trying to kill him?"

Baseball Fan: "No; not the slightest intention of it. The league is launching a new umpire and we are just christening him!"

READ YOUR METER.

A great many differences between patrons and electric light companies may be avoided if patrons will learn to read the meter, thus knowing just how much electricity they are using. If this is done the oft repeated statement, "I know I have not used as much light as I am charged for," will be heard less often.

Before an electric meter is placed upon the market by a manufacturing company, it is thoroughly adjusted, tested, and sealed against being opened by any one. In that condition it reaches a patron and may be depended upon as being correct.

A light company sells its power by the kilowatt hour, meaning 1000 watts per hour, hence the meter is made to record these amounts. (Occasionally a meter is graduated to read in watts; if so, the final reading divided by 1000 gives the kilowatt hours).

Being unable to use a cut of the meter it is necessary to give the following description. We will consider a four-dial meter reading to 10,000 kilowatt hours.

The dials over which the hands move are about the size of a 25-cent piece, each being divided into 10 equal spaces, the "0" at the top of the circle. Each dial is graduated in, and each hand moves in reverse direction to the one preceding; also, each hand moves 1-10 as fast as the one before. Call the dials 1, 2, 3 and 4, respectively, numbering from right to left. Suppose all the hands set at "0." When the hand of dial "1" has moved from "0" to "1," one kilowatt hour is recorded; when this hand has made one complete revolution the hand of dial "2" has moved from "0" to "1," recording 10 kilowatt hours; when the hand of dial "1" has made 10 revolutions that of dial "2" has made one revolution, and the hand of dial "3" has moved from "0" to "1," recording 100 kilowatt hours; when the hand of dial "1" has made 100 revolutions, that of dial "2" has made 10 revolutions, that of dial "3" has made one revolution and the hand of dial "4" has moved from "0" to "1," recording 1000 kilowatt hours; hence the dials read 1, 10, 100, 1000 kilowatt hours, respectively.

In taking the reading from the meter, read the number back of each hand, and always consider the reading of each of two consecutive hands for a final result. The necessity of taking two hands, as indicated, is that they may not be accurately placed upon the dial, hence an error may arise if the individual hands only are relied upon. If the hands are accurately placed the reading indicated by each can be used as final.

Suppose the hands upon the dials stand as follows: dial "1" at 3; dial "2" a little past 7; dial "3" a little past 5; dial "4" slightly over halfway between 2 and 3, then

Dial 4 reads	2	1000s or	2000 k. h
Dial 3 reads	5	100s or	500 k. h.
Dial 2 reads	7	10s or	70 k. h.
Dial 1 reads	3	1s or	3 k. h.
Meter reading			2573 k. h.

Record this result and, at the end of a week or month, read the meter again. Find the difference between any two readings and knowing the rate charged per kilowatt hour, you know the cost of your electric light any time you wish.—Fred G. Person, Colorado Agricultural College.

BULLETINS ON TREES.

The state agricultural experiment station has recently issued Bulletin No. 90, entitled "Forest, Shade and Ornamental Trees in Washington." This bulletin is a report of experiments which have been in progress for fifteen years, on the grounds of the State College at Pullman, to determine what varieties of trees, shrubs, etc., can be successfully grown on the treeless area of Eastern Washington. The results reported in the bulletin show that a much larger number of varieties of trees will make very satisfactory growth in these regions, if properly cared for, than was formerly thought possible. The methods of propagation, planting, and cultivation which have been found to give the best results are described in detail in the bulletin. A complete description of each variety of tree, or shrub, which has been tested, with comments on its hardiness, drought-resistance, and rapidity of growth, is also given. A brief summary of the most important recommendations concerning growing trees in this state, with recommended lists of varieties for planting in different parts of the state is presented in Popular Bulletin No. 23, "Trees in Washington." Copies of either of these bulletins may be had by writing to the Director of the Experiment Station, Pullman, Wash.

FORGETFUL.

"Dear Clara," wrote the young man, "pardon me, but I'm getting so forgetful. I proposed to you last night, but really I forget whether you said yes or no."

"Dear Will," she replied by note, "so glad to hear from you. I know I said 'no' to someone last night, but I had forgotten just who it was."

THANKSGIVING.

In the gloaming of November
With its foliage of gold,
Comes again the glad Thanksgiving
With its customs dear and old;
And beneath the starry banner
As it floats from sea to sea,
We a happy Nation gather,
Fears at rest, for all are free.

Not a hand in all this Nation,
In the East or in the West,
Bars the mansion or the cottage
To the kind Thanksgiving guest;
From the balmy groves of Southland
To the nodding pines of Maine,
Nature, filled with joy and triumph,
Spreads the yearly feast again.

We are thankful for the blessings
That have crowned our cherished land—
Fruitful orchards, golden harvests,
Peace and love from strand to strand;
'Neath November's robes of beauty
Hidden lies the warrior's sword,
And the olive branch is hanging
O'er Columbia's festal board.

Aye, from mountain unto mountain,
'Neath the Union's azure dome,
To the feast we spread each autumn,
Bid the absent welcome home.
Round the board where all are merry
Let the rarest sunlight play,
With the love-key of Thanksgiving
Open every heart today.

Heaping full are all our garners,
And our rivers as they run
Sing a matchless song of plenty
To the distant seas of sun;
As a people God has blessed us.
Who are happier today?
Let the land from mount to ocean
Sing a sweet Thanksgiving lay.

Hail the hallowed Thanksgiving
That the Pilgrim Fathers gave!
Tis their legacy forever
On the land and on the wave;
Then, as Freedom's chosen people;
We our destiny fulfill,
Let the future's glad Thanksgivings
Find us grander, greater still.

—Anonymous.

THE THANKSGIVING THAT RAN AWAY.

By Mildred Norman.

The big turkey gobbler had made a splendid fan of his tail-feathers, and was strutting up and down the poultry-yard, the proudest bird alive.

Carrie and Paul were looking through the wire fence and admiring him.

"It seems a pity to cook him, doesn't it?" said Carrie.

"He is handsome," replied Paul, "but how could we have any Thanksgiving without him?"

It was the day before Thanksgiving, and at night Mr. Murphy was coming to the barn to get Mr. Gobbler ready for the roasting-pan next morning.

"Be careful to fasten the gate securely," said Mrs. Denning to Paul, as she went out to feed the poultry.

"All right, mother," said Paul carelessly. He had fastened the gate so many times, what was the use of reminding him? "This latch needs a screw," said Paul, "but the hens do not know it nor the gobbler. I'll fix it after Thanksgiving."

Carrie and Paul ran almost all the way home from school that night so eager were they to get another sniff of the delightful odors that stole from the kitchen, suggesting all kinds of good things.

How the wind blew, and chased them and pelted them with the crisp, brown leaves! How cosily the blue smoke came curling up from the chimneys of the houses they passed! And the crows cawed so lustily it seemed as though they knew what a good time was coming. Carrie and Paul stopped a moment to watch the smoke.

"Yes," said Paul, "it is going up as straight as can be. We shall be sure to have a pleasant day tomorrow."

"And Aunt Caroline and Bessie and Frank and Edgar will be sure to come then," said Carrie. "Oh, goody! I can't wait for tomorrow."

They burst into the kitchen like a young cyclone, and ran to the stove and the table and the pantry and the cellar. And lastly they ran to the dining room where they knew there would be a big pile of nuts ready to be cracked, and two nut-crackers waiting to be used.

"We must eat one of each kind to see if they are good," said Paul.

"And if any look uncertain, we must eat them to make sure the company do not get bad nuts in their mouths," said Carrie.

Paul was the first one to put a suspicious nut in his mouth, and he was making a wry face over it when a big, thumping knock came at the back door.

"Mr. Murphy!" cried the children in a breath. "Gobbler is ready. He doesn't look so handsome now, but how good he will taste!" said Carrie.

They ran into the kitchen to have a look. There stood Mr. Murphy in the doorway, and Mrs. Denning looking at him inquiringly.

"I can't foind no torkey, ma'am," said Mr. Murphy. "I've looked all over the yard and the houses and coops beyant and all over the place, and not a bit of a torkey can I foind."

No one spoke for a moment. Then the children made a dash for the poultry-yard. They, too, ran all over the place without finding anything of the turkey except a few feathers. Mrs. Denning went out and looked, and then she dismissed Mr. Murphy.

"Oh, mamma, can't he stay and fix us a chicken?" cried the children.

But Mrs. Denning said there were none that could be spared, and as soon as the door closed on Mr. Murphy, Carrie and Paul sat down and cried. You would have thought their hearts were broken,—and Paul considered himself quite a young man, too, for he was almost ten, and Carrie was half past seven.

"Somebody stole our turkey," said Paul, when he could speak.

"A dreadful bad man," said Carrie. "I hope it will make him sick."

"Maybe he was a very poor man, who never stole anything before, and had a lot of hungry children who had not a thing to eat," said Mrs. Denning.

This made Paul and Carrie thoughtful.

"He needn't have stolen, then. He might have come to the door, and asked for something," said Paul.

"Maybe he did not steal the turkey, but found one running wild, and shot it," said Mrs. Denning.

This gave the children an idea, and recalled to Paul's mind the latch that needed mending.

"Let's go and look," said Carrie in a whisper to Paul. "Maybe the turkey did get out somehow, and is out in the woods now."

But it was fast growing dark, and Mrs. Denning told them they would have to wait until morning.

CULTIVATOR PUBLISHING CO.,
115 No. Broadway,
Los Angeles, Cal

It was hard to wait when the man with the gun might be that very moment takig aim at their Thanksgiving turkey, and Mrs. Denning told them that they might inquire in the neighborhood if any one had seen a stray turkey.

They ran as fast as they could from house to house, but no one had seen anything of gobbler. Then they went home, and were so tired and troubled they could not eat any supper, not even a cranberry tart, but went to bed and sobbed themselves to sleep.

Bright and early they were out next morning, looking all about the woods back of the house, and calling "Gobble, gobble, gobble," but no answering gobble came back to them.

Paul climbed a tree to get a "good look around," and in his haste tore a large rent in his knickerbockers, and Carrie fell into the brook, and lost her hair ribbon. Altogether they were in a sorry plight when they got home.

"It's all my fault," said Carrie. "I forgot to feed him yesterday. I thought I would play a while first, and then I forgot it. That made him want to get out. But I can't see how he did it. Isn't it dreadful to have your Thanksgiving run away?"

"It is all my fault," said Paul, trying to comfort his sister a little, and looking ruefully at the gate and the latch that he had not mended. "I'll never leave a screw loose again."

They went sadly into the house; gay voices greeted them. There were the cousins and Aunt Caroline, all smiling and chatting just as though the Thanksgiving had not run away.

Paul and Carrie tried to get in without being seen, that they might change their clothes and make themselves look well, but Bessie's bright eyes spied them out, and the three cousins flew upon them and began to exclaim and to ask questions and to laugh, as though there was nothing in the world to cry about.

"What smells so good out in the kitchen?" cried the cousins in a chorus. "Come out and see." And out they tripped, full of glee and holding fast to Paul and Carrie.

"M'm, turkey!" said Bessie, standing on tiptoe and taking a delicious sniff.

"No," said Paul. "Hasn't mamma told you?"

"But I'm sure I smell turkey,' insisted Bessie. "Course it's turkey," cried the two boys; 'just as if we don't know turkey." And Bessie ran to the over-door, peeped in, and then threw it wide open. "There!" she said.

Sure enough, a big gobbler was sizzling in the roasting-pan and browning beautifully. Paul and Carrie could not speak for amazement. Was it after all a bad dream? Or was this a dream?

The cousins laughed more and more, and at last Frank shouted, "He got out and ran over to our house. We knew him by the ring about his neck."

"And mamma had him fixed all ready to put in the oven, and we came over as early as we could," said Bessie.

"Where did you go? We have been out looking everywhere for you," said Edgar.

Then Paul and Carrie began to smile once more, and Carrie got away from the merry cousins and ran upstairs to change her wet shoes and frock and tie a fresh ribbon on her braid; but Paul went out to the poultry yard and put a new screw in the latch, and did several other things that he had been putting off for another time. And the cousins could not coax him away until he had finished.—Sunday School Times.

THANKSGIVING RECIPES.

Oyster Soup.

One quart oysters; 1 pint milk; 2 tablespoons butter; 1 teacup hot water; pepper, salt; strain liquor from oysters, add water and place over a hot fire in granite kettle. When near the boil, add salt, then oysters. Cook about five minutes from the time they begin to simmer, until they ruffle. Stir in the butter, let come to a boil and pour into the tureen. Stir in the boiling milk, and send to table. All water in place of milk may be used if preferred.

Roast Goose.

Stuff the goose with a dressing made as follows: Potatoes boiled, peeled and mashed fine and light; 1 tablespoon salt; 1 teaspoon pepper; 1 teaspoon sage; 2 tablespoons of onion juice; 2 of butter. Truss and dredge well with salt, pepper and flour. Roast before the fire (if weighing eight pounds), one and one-half hours; in the oven, one and one-quarter hours. Make gravy. No butter is required for goose, it is so fat. Serve with apple sauce.

Roast Duck.

Ducks to be good must be cooked rare; for this reason it is best not to stuff. If you do stuff them, use the goose dressing, and have it very hot. The better way is to cut an onion in two and put in the body of the bird, then truss, and dredge with salt, pepper and flour, and roast it before the fire, forty minutes; if in the oven, thirty minutes. The fire must be very hot, and the oven a very quick one. Serve with currant jelly and a sauce.

Roast Pig.

Select a pig from four to six weeks old. Clean it thoroughly, using a teaspoon of soda in the water you wash the inside with. Wipe dry and stuff with a dressing made of bread crumbs highly seasoned with butter, sage, salt and pepper. Sew it up. Skewer the fore legs forward, and the hind legs backward. Rub it over with butter, and sprinkle with salt, pepper and flour. Put it in a dripping pan with a little water and bake about three hours, basting often. It is not necessary to have the oven very hot at first; be careful not to let it burn. When done, place it on a platform; garnish with parsley and put an apple or small ear of corn in its mouth.

Plain Dressing for Roast.

One large or two small stale loaves of bread, three-quarters pound butter, one teaspoon salt, two teaspoons sage, one teaspoon pepper. Use only the soft part of the bread, finely crumbed, and work in the butter without melting.

Cranberry Sauce.

One quart cranberries, two cups sugar, one pint water; simmer until they burst open, do not stir, put sugar in after they have burst open, boil for twenty minutes.

Baked Sweet Potatoes.

Wash perfectly clean, wipe dry, bake in quick oven according to their size, half hour for small size, three-quarter hour for larger, and full hour for largest. Let the oven have a good heat and do not open unless it is necessary to turn them until they are done.

Cabbage Salad.

Two quarts of cabbage, chopped. Mix with the following dressing:

Mayonnaise Dressing.

Put in a stew pan a lump of butter the size of an egg. When melted put in tablespoon of flour, add teacup of

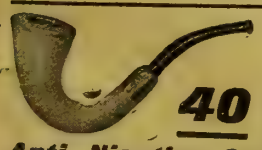
The Little Friend of the Deaf

Actual Size

This ad is to deaf people who have about given up—who are failing in hope and in courage—people who think their cases unlike other cases which have been cured. We don't want any money. Just send for a book that tells about "Wireless Telephones for the Ears"—little devices that 390,000 deaf people are using today because they HEAR with them. Think of it, men and women; these tiny wonders are so small that they fit in the ear *out of sight* and so *soft* that you never feel them, even when lying down! *Yet you hear whispers!* Is your case beyond such simplicity? Not a bit of it. One of the officers of this company is a deaf man. He became desperate, and in desperation developed this marvelous ear drum. It is one of the inventions of Mother Necessity—an *inspiration*. Talk to him today. You'd never even suspect his affliction. He's been improving this tiny "'phone" for 20 years. There is nothing else to compare with it—anywhere. Don't you want the book he has written about it—a book by a man who understands deaf people because he is one of them? You do, if you want to get back your hearing. Just say, "Send the book," on a post card, and mail it to WILSON EAR DRUM CO., 312 Todd Bldg., Louisville, Ky. (17)



Only 40 Cents

Anti-Nicotine Calabash Pipe

THIS splendid Calabash is modeled on the lines of the original African Calabash Gourd. I have placed in it my famous Anti-Nicotine Bowl, made of a clay-like material which absorbs the nicotine and uses it to color the pipe like the finest Meerschaum.

Three for One Dollar . You do not have to "break in" this pipe. There are no vile fumes. It is always sweet, clean, dry. With German Silver mountings, 40 cents each, three for a dollar. Sent prepaid anywhere with a copy of our fine catalog of smokers' articles. Send today. Money back if not satisfied. H. Menges, The Smoker's Friend, 981 Menges Bldg., St. Louis, Mo.

water and let boil. Have ready three beaten eggs mixed with a tablespoon of sugar, one teaspon dry mustard, one teacup vinegar, stir in with the rest of the ingredients, let come to a boil, and set away to cool. Pour onto chopped cabbage, stir well. Half a cup of sour cream is an improvement stirred in just before served.

Pumpkin Pie.

Peel, slice and stew pumpkin until tender and almost dry, mash fine, add one quart rich milk with a little sweet cream, three cups pumpkin, two cups sugar, little piece butter, four eggs, yolks beaten thoroughly and stirred in and whites beaten to a froth and added just before putting pie in oven, scant tablespoon of ginger and cinnamon. Have a rich crust and bake in a quick oven.

Mince Pie

One pound chopped apples, one pound stoned raisins, one pound suet chopped fine, half pound citron, half ounce of mixed spice, one pound sugar, one teaspoon salt, mix thoroughly, add enough water to moisten and cook for one hour, half pint cider. When making the pies add a little more sugar if necessary.

Baked Hubbard Squash.

Cut in pieces, scrape out the seeds and soft part, bake from one to one and one-half hours, according to the thickness of the squash.

THANKSGIVING DAY.

Every Thanksgiving I thank God that I am an American. I know the faults of my countrymen, their brag, their bluster, their self-assertion, but I have traveled a great deal and come in contact with many races of men, and I have never found anywhere kinder-hearted, more unselfish, more God-fearing, more intelligent, broader-minded men and women than those whom I am proud to call my fellow-citizens.

This year every harvest field groaned under its magnificent tribute. Did that come from you? You indeed sowed the seed, you ploughed, you reaped, you invented the machines which lessened so greatly the toil, but the sunlight, the mysterious chemistry of the air and the earth, the fertilizing of the rain, that unseen, untraceable force which out of the shining grain developed the nodding cornstalk with its tassels stirring in the evening breeze, was not all that direct from God? Ought He not to be devoutly thanked for it, not only by words, but by the grateful tribute of an unselfish life?

The Old Testament is full of the thanksgiving of ancient Israel over His mercies to them, but just compare what he did for them with what He does for us. He dried up the Red Sea for their marching armies, it is true, but He has enabled us almost to annihilate distance and in a few hours to transport our armies thousands of miles. The walls of Jericho fell down at the shout of Judah, but our skill has fashioned engines which would crumble walls ten times as stout to powder. He gave them the little land of Palestine. He has given us a glorious empire which stretches from ocean to ocean, with every climate, and rich with every production. Now do you think we can enjoy all this wonderful blessing of God without conditions? that we can do just what we please, and that still our march will be onward? Do you think we can throw away the recognition of God, throw away thanksgiving, throw away virtue, become a nation of atheists, become a swinish, besotted race, and still be able to possess and enjoy this matchless heritage? You are poor readers of history, to say nothing of the Bible, if you think so.—Rev. Clinton Locke, D. D.

THE THANKSGIVING SPIRIT.

Thanksgiving Day is not a day for scolding, fault-finding or reminding people of their failures. The pessimists should disappear from sight and sound that day. In the home, in the church, upon the street, let there be joyful, praiseful lives. Let the world hear only words of cheer and messages of hope and gratitude. Whatever another year may bring, let this Thanksgiving Day be one of receiving and giving forth joy.

Thirsty Land-or Big Crops?

You can't grow big crops on thirsty land. And you can't afford to depend on rainfall for your water supply. Be independent of all outside conditions. Have your own irrigating system and insure your profits.

I H C Gasoline Engines

are in use on thousands of farms, pumping water from streams, lakes, rivers, and wells. They work steadily, easily, and economically. They are strong, simple, durable, and dependable. They quickly pay for themselves and continue to pay big profits month after month and year after year.

I H C Engines also do all other kinds of farm work, such as operating your feed grinder, clover huller, fodder cutter, thresher, saw and other similar machines better and cheaper than any other engine. The I H C line includes a style and size for every need.

Vertical type—2, 3, 25, and 35-H. P.; horizontal—1 to 50-H. P.; semi-portable—1 to 8-H. P.; portable—1 to 25-H. P.; traction—12 to 45-H. P.; sawing, pumping, spraying, grinding outfits, etc. Built to operate on gas, gasoline, kerosene, distillate, or alcohol—air-cooled or water-cooled. See the I H C local dealer, or, write nearest branch house today for our new catalogue.

WESTERN BRANCH HOUSES: Denver, Col.; Helena, Mont.; Portland, Ore.; Spokane, Wash.; Salt Lake City, Utah; San Francisco, Cal.

INTERNATIONAL HARVESTER COMPANY of AMERICA
Chicago (Incorporated) U S A

I H C Service Bureau

The Bureau is a center where the best ways of doing things on the farm, and data relating to its development are collected and distributed free to everyone interested in agriculture. Every available source of information will be used in answering questions on all farm subjects. If the questions are sent to the I H C Service Bureau, Chicago, they will receive prompt attention.

The Van Brunt Disc Drill

Hay.

Scott, Magner & Miller say:

Arrivals of hay have been 3,350 tons during the past six days. This amount is just about the average that we have been receiving for several weeks past.

We are pleased to note a little inquiry from a number of the country districts who are now in the market for hay. This trade is particularly advantageous to this market, as it will keep considerable hay tributary to our markets from coming to San Francisco, and to that extent will better the situation generally.

There has been somewhat of hay sent forward on export account during this past week, and there are orders now in process of being filled which will move off quite a little hay.

Alfalfa has continued to come in large quantities steadily from the river districts, but this hay is now pretty well cleaned up, and the market on this article should take on a little better tone.

We quote the wholesale prices in round lots on today's market as follows, viz.:

Fancy Wheat Hay	18.50@20.00
No. 1 Wheat or Wh & Oat	16.00@17.50
No. 2 Wheat or Wh & Oat	13.00@14.00
Choice Tame	16.00@17.00
Other Tame Oat	11.00@14.00
Wild Oats	10.00@13.00
Stock Hay	5.50@6.00
Alfalfa	9.00@11.00
Straw, bale	60@70

Grain.

Wheat	1.47½@1.52½
Barley, fancy	1.92½
Barley, good to choice	1.90
Barley, poor to fair	1.80@1.85

Mixed Feed, ton	25.00@27.00
Shorts	29.00@30.00

Deciduous Fruit Market

F. B. McKevitt, general manager of the California Fruit Distributors, reports:

Sacramento, Cal., Nov. 18, 1911.

The following gives number of cars of deciduous fruit shipped from all points in Califorina for the week (seven days) ending Friday morning, Nov. 17, 1911:

Pears, 2 cars: These pears consist mostly of Easter Beurres, with a few small lots of other varieties, which represent the finish of the crop. While it is possible there may be a car or two yet to go forward, it is not probable, and it is expected that this shipment will be the last of this variety for the season.

Grapes, 209 cars: The varieties now going forward are mostly Emperors, with a few Cornichons. Heavy frosts in most localities have destroyed what grapes were on the vines. In a few sheltered places, however, no damage was done, and limited shipments will go forward for a few days yet. It is not likely that the entire shipments from the state from this time on will aggregate more than possibly 100 cars, and it may not be as large as this. It is expected that the shipments will be entirely completed during the next seven days.

Weather is now pleasant, but rather cool, with light frosts every morning.

Comparative statement of shipments up to November 11:

	1910.	1911.
Cherries	250½	216¼
Apricots	289¾	214½
Peaches	2,517¾	2,027
Plums	1,552½	1,366
Pears	2,361	2,312¾
Grapes	4,829½	6,068½
Sundry	16	16¼
Total	11,817	12,221¼

Citrus Fruit Market

LOS ANGELES, Nov. 22, 1911.

Navels now going forward from Northern and Central California are being well received and commanding not far from $2.50 f. o. b. for first class stock. Generally the fruit is well colored. Florida and island fruit is satisfying the demand of the Eastern coast trade, and Valencias are still being offered in the auction. No Navels have yet reached the auction markets.

Lemons are still holding up a fair price and being well received. Shipments are considerably in excess of last year at this date.

Shipments.

Shipments of oranges to date this season since Nov. 1, 79 cars; lemons, 277; total, 356. To same date last season: Oranges, 73 cars; lemons, 260; total, 333.

NEW YORK, Nov. 21.—Four cars Valencias, three cars lemons sold. Market steady on oranges, easier on lemons. Weather fair.

PHOSPHATE DEPOSITS.

(Continued from Page 515.)

to the large copper smelters is important, for these smelters produce great quantities of sulphuric acid and sulphurous acid fumes which are usually allowed to go to waste through the smokestack of the plant. Reduction of phosphate rock by means of sulphuric acid appears to offer what is perhaps the largest commercial use for these waste products of the smelters." Mr. Gale quotes a report showing the daily loss at the Anaconda smelter alone of about 3800 tons of sulphuric acid.

Suggests Concentration.

Mr. Gale suggests a further innovation in the treatment of phosphate rock which would greatly reduce the transportation charges that at present stand in the way of development. By this process a ton of concentrated phosphate would equal three tons of ordinary superphosphate. The fertilizer distributor would therefore pay freight on one ton where he now pays it on three.

The report calls attention to the fact that under the present mining law there appears to be no adequate provision for the disposal of phosphate lands, and that it is presumed that Congress will in the near future pass some well-considered measure to cover this need.

Mr. Blackwelder's contribution on phosphate in western Wyoming is a preliminary report and shows large and widely distributed deposits. He also mentions the presence of very great quantities of low-grade rock, which in course of time will doubtless be mined. For instance, in the Snake River canyon in western Wyoming he noted a total thickness of phosphatic beds exceeding 40 feet, of which about 29 feet contain more than 30 per cent phosphoric acid and some beds contain 70 per cent or more. As showing the general lack of knowledge regarding phosphate deposits Mr. Blackwelder mentions an excavation in the phosphate beds near Tieton Pass. This tunnel, dug more than 15 years ago, was made on the supposition that the black material was coal. Its real nature was not recognized, and throughout the district the very existence of phosphate deposits seemed to be unknown to the inhabitants.

WITHOUT A RIVAL.

Seldom has an invention of so much practical value been presented to the farmers of California as that found in the Chilson Automatic Harrow, an illustration of which will be found in this issue.

We take pleasure in presenting this harrow to our readers and suggesting that they become acquainted with it, as its worth will be apparent the first time it is used and will remain in evidence throughout a number of years in labor-saving value.

Those who have personally inspected this harrow unhesitatingly state that it is without a rival. The ease with which it is operated places it in the front rank as a money maker and time saver. Complete information may be had free by writing the manufacturers.

50 Per Cent Saved

BY BUYING YOUR OIL STOVE NOW

We guarantee that you cannot buy this stove for less than twice our price.

The New Perfection Wick Blue Flame Oil Stove, we believe the best all-around cook stove that has ever appeared, from the standpoint of efficiency, simplicity and durability. We believe it is as near perfection as human skill and modern machinery can make it.

The stoves are artistic in design and pleasing to the eye. The chimneys are enameled in blue, which makes them rust-proof and easily cleaned. With these stoves there is no time lost in lighting, but a good working flame is obtained as soon as the stove is lighted, and after use it may be instantly extinguished, thereby saving fuel.

The flame may be instantly controlled by the operator, the same as that of a kerosene oil lamp.

The New Pomona Power Heads

—FOR—

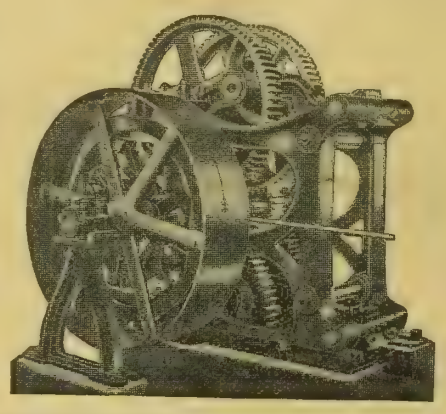
Deep Well Pumping

The New Pomona Pump is of the double plunger type; one plunger goes up while the other goes down. Its design includes the quick return motion and lap in the plungers. It is built on strictly mechanical lines, round wheels being used, and a direct center pull on the pump rods obtained. In the beam motion employed the upward motion of the pistons is much more uniform than a crank motion, producing a smoother, evener flow of water, and the downward motion is a smooth, quick, gliding movement, while the gears pass the dead points and take up the load without any JERK or JAR.

There is a long lap, so that one plunger passes the dead point and takes the load before the other reaches the top of its stroke, keeping the water in continuous motion, thereby saving power and wear and tear on machinery resulting from starting the column of water at the commencement of each stroke.

This plan produces an IDEAL MOTION of the pump rods. There is no possibility of breaking the rods as other pumps do, and the BUGBEAR that is so much dreaded in deep well pumping is avoided. It also produces a continuous pull on the belt and an even application of the power applied. The flop, flop of the belt seen in other pumps and the extreme high points and the fluctuation of the electric current when using a motor are reduced to a minimum, or, to quote the words of the City Engineer of Pomona, "The plant does its work with remarkable steadiness and has more than met the requirements of the specifications and agreements," or, in the language of the testing department of the Edison Electric Company, "The power taken is very uniform at different parts of the stroke for a pump of the plunger type."

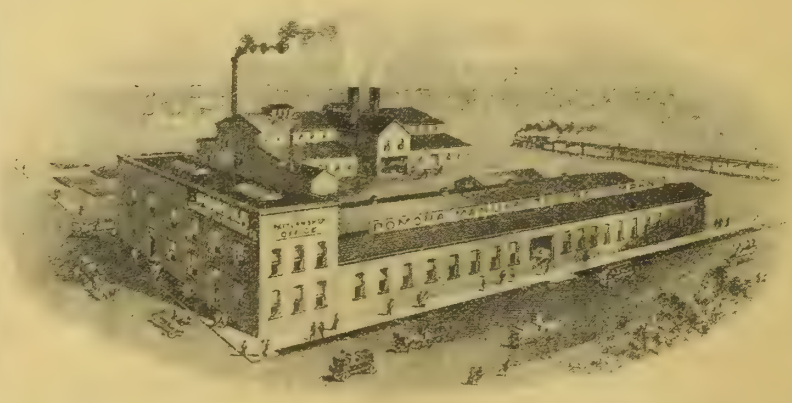
The POMONA DEEP WELL PUMPS are the standard for reliability and efficiency, and can be depended upon to do their work with less trouble than others. They are manufactured by a company who have the equipment and ability to build their machinery in a first-class manner and to install them satisfactorily to their customers.



This cut is a side-view of the New Pomona Pump showing friction pulley and cut board bearing.

OUR GUARANTEE

The Pomona Power Heads and Cylinders are guaranteed to be made of good material and built in a workmanlike manner, and we agree to furnish free of charge at our factory in Pomona, within one year from date of erection, duplicates of any broken parts on return of such broken parts, natural wear excepted. We do not hold ourselves responsible for repair bills or damages for delays.



The above cut represents our plant—located in the center of the largest deep well irrigation district in the world.

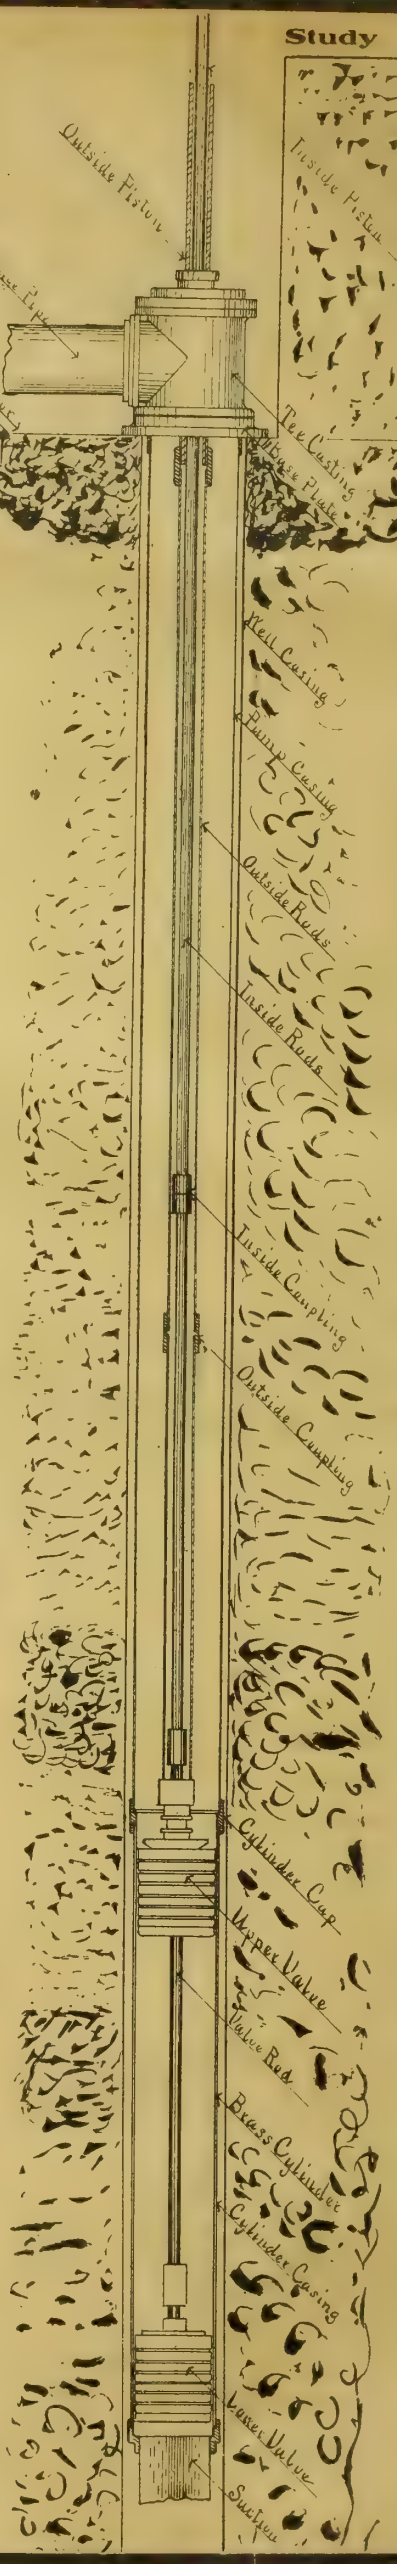
POMONA MANUFACTURING CO.

POMONA, CALIFORNIA

Or C. H. WEED, Porterville, California
Agent for the San Joaquin Valley.



One of —the most important factors in the success of the Pomona Pumps is the cylinder and valves.

Our cylinders are made of the best seamless brass tubing made to order in the East. The valves are made of the best phosphor bronze and are cast and finished complete in our shop.

These valves are of the most improved pattern, have cone-shaped clappers with ground metal seats. There is only one moving part in each valve. The plungers are furnished with three or six cup leathers each, as desired, made from the best oil tanned leather.

With the New Pomona pump-head, using a quick return motion and lap in the plungers, these valves have sufficient time to seat before taking up the load of the water column, consequently there is no hammer or jar. The Pomona Pumps are taking the lead for irrigation purposes, and are rapidly displacing pumps of inferior design and workmanship.

We also make a full line of circular valves for orchard and alfalfa irrigation. The POMONA CIRCULAR VALVE can be adjusted to allow the flow of any quantity of water up to and including the capacity of the pipe line or stand pipe—by merely turning a thumb screw. It is non-corrosive, cheap, simple, requires no special tools or wrenches to operate, and is very substantial.

WE INVITE INQUIRIES.

We also manufacture our patent

PRESSURE GATE,

which has no rubber or wooden facing to rot or wear out—is absolutely water tight when closed—is cheap in price and as durable as solid iron.

Pomona Patent Pressure Gate

Middle West Farming Today and 35 Years Ago

Observations and Reminiscences by J. H. Reed of Riverside

I have been taking a leisurely tour of observation in the Middle West and the South. Possibly some account of two or three special matters looked into may interest some of the Cultivator's readers.

This Side the Missouri.

Much is written about the remarkable development of the agricultural country between the Missouri River and the Rocky Mountains. But for the most part it is written in a general way, for the purpose of making interesting reading, rather than to give definite, reliable information. My study was especially in Nebraska and Kansas. It is easy to write of the wonderful growth of these states. Of the phenomenal advance in farm values in a brief time; how their products are helping feed the world; how they are already sending strong men by the thousands to help develop newer sections of our own country, and across the border to the north, just as the states the other side of the Mississippi river were sending pioneers to these trans-Missouri virgin soils only half a life-time ago. Or of what is more remarkable, how they are already sending hundreds of heads of families from the farming districts, with self-earned ample fortunes, to spend their later years in near-by cities, or to quiet suburban life, in more friendly climates.

But how all this came about in so short a time is more easily understood if one is on the ground in actual touch with what is going on. Especially if one had some first knowledge of the earlier conditions and activities.

Increase in Value.

Thirty-five years ago the writer bought a section of Nebraska land, one hundred miles west of Omaha, for ten dollars an acre. Today that land could not be bought for less than $200 per acre, and would quickly be sold at $175, if put on the market. I found from $150 to $200 is the ordinary price at which good farming lands in that section change hands when sold, and farms for sale often go into the hands of near-by farmers who know their productive values.

Intelligent Farming of Good Soil.

The factors that have brought about this remarkable advance are not far to seek. The basis, of course, is the high grade of soil. But of equal importance was the kind of men who handled it. The pioneers were largely intelligent, sturdy men from the farming districts east of the Missouri river, experienced farmers.

It was about the time these states were being rapidly settled, that many of the most important improvements in farm implements were being made. The twine binder that revolutionized the mode of harvesting small grains was being introduced. The sulky plow, the grain drill, the thresher, the corn planter and cultivator were all being greatly improved. In many sections of the country these new and improved implements came into use very slowly. These intelligent, enterprising Nebraska and Kansas farmers quickly recognized their value and promptly put them into use.

Better Seed.

Then came the era of introducing better varieties of grains and improving the best varieties. In those earlier years the farm revenues were almost exclusively from sales of grain. Spring sown wheat with frequent failures, at first was the rule. Winter wheat was being introduced and is now mostly used. Varieties better adapted to climatic and soil conditions were sought for and these enterprising farmers enlisted the Federal Department of Agriculture in their quest, and they were found.

Corn was easily raised, but the markets were distant and net income from it small. It had so little cash value as often to be used for fuel in place of coal. The writer has eaten many a meal cooked by a corn fire, and often sat by a stove heated by the same fragrant fuel during a Nebraska blizzard. But it was not pleasant to see this splendid grain put to so ignoble a service. Cattle were soon brought in from southern and western ranges, in the fall, and in the spring our corn was marketed on the hoof in Chicago.

Breeding Up.

The average yield of corn was low in quantity and quality. About this time students of the Illinois College of Agriculture had their attention turned to breeding better seed corn. By the way, one of the young men was our Mr. Shammel whom the Washington Department of Agriculture has sent here to investigate the possibilities of improving citrus fruits by bud selection, and from what he has accomplished in this direction for other plant industries, we may have assurance that he will succeed in this the most important investigation ever undertaken in the interests of the citrus industry. He not only demonstrated the practicability of materially increasing the corn yield by use of the improved varieties in the corn states proper, but bred a variety especially adapted to the conditions of the far South and another for the thin soil and short growing season of New England.

The adoption of the improved varieties of corn by these western farmers has already increased the average yield from 10 to 25 bushels per acre. Multiply this by the millions of bushels of their annual crop and one gets some idea of the value of the progressive methods of these intelligent farmers.

Another advanced step has been made in raising their own cattle to fatten on their corn, in place of depending on the fast decreasing supply of feeders from the grazing grounds farther west.

Alfalfa.

Again, since my time they have added what is proving to be one of their most important crops. While a Nebraska farmer, I tried to keep informed as to new things and improved methods in other agricultural sections. I read with interest about the new forage crop then becoming famous in Southern California, alfalfa, or Lucerne, as we called it, and sent for some seed. I followed instructions in trying to produce a crop, but it was quite a failure, and we decided that however good alfalfa might be in California, Nebraska was no place for it. It was several years before it was tried in that section again. Now it is a leading and one of the most important crops in many parts of Nebraska and Kansas. Without irrigation, which is little used yet, they get three fairly good crops. Much of their alfalfa is ground, mixed with grain feed for local use, but largely shipped. Alfalfa mills are common, and alfalfa meal is a staple commercial product.

But the most important part this new forage crop—new in that section—plays in their modern agriculture, is its place in their scheme of rotation of crops.

Rotation.

And here we have another important factor in the explanation of the unusual progress and prosperity of this agricultural section. For many years we have heard much about the value of rotation of crops. And its value is generally accepted in theory. But on going about, I find in actual practice even among fairly good farmers, its methodical use is quite the exception. The best Nebraska farmers are using it generally. The following order is much practiced. Corn followed by wheat or other small grains followed by alfalfa or clover, two years. Little commercial fertilizer is used, but in preparing for the corn crop, the land is heavily covered with manure from the stables or feeding yards. This once in four years with the alfalfa, is maintaining their fertility in fine shape, while producing heavy crops.

Education Has Done It.

Another item. Both Nebraska and Kansas have strong state colleges of agriculture which are well patronized by farmers' sons. While I was there Secy. Wilson of Washington gave an address to the university students at Lincoln in which he strongly depicted so many of the bright young men of the country preparing themselves for the overcrowded professions. He insisted that where there was one place waiting for a young man trained for a profession, there were a score desirable and remunerative, in agriculture, seeking young men of brains and special training.

But the feature that especially interested me was the popularity of the special sessions for practical farmers held during the winters. I found it was a common thing for well-to-do, middle-aged successful farmers to attend these practical schools.

In these briefly stated items it seems to me we have the explanation of the marvelous development in a brief time of that noted agricultural section of the great Middle West. Good lands and intelligent, practical farmers to commence with, prompt adoption of improved appliances, and progressive, scientific methods, scientific agricultural education of young men, and the spirit of keeping in touch with scientific investigation by the practical farmers.

Why to Canada?

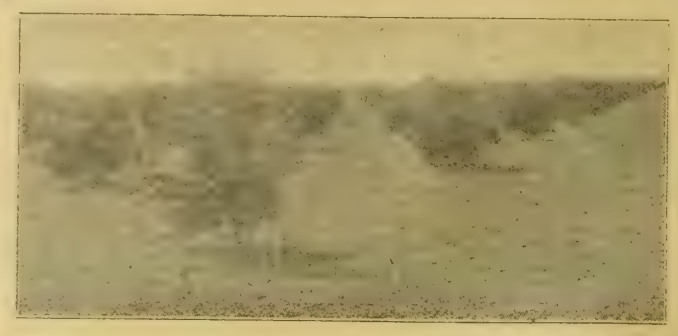
Now as to the early emigration from these prosperous states to Canada, of which we hear so much. I confess it had been difficult for me to understand. On the ground, it is not a hard problem. These large farmers require a good deal of help. This is largely of an intelligent, sturdy class of men, mostly from eastern farms, but including many of the better class of foreigners. With fair wages and low expense this farm help saves money, and they soon want land of their own. Prices there are now quite beyond their means, and naturally they seek lower priced lands.

Again, there are a large number of tenants on farms owned by large landlords. As they add farm to farm they secure the best available practical farmers to manage each. Many of these farm for a portion of the crops. Many of them are good farmers and accumulate, but not fast enough to buy the high-priced lands they are on. It is largely from these two classes that the successful farmers on the rich, cheap grain lands of western Canada are being recruited from our prosperous western states. They do not leave the United States because of any dissatisfaction, but because their limited money will provide them farms at once in the neighboring country.

Come to California.

That these intelligent farmers who have so quickly accumulated a competence should desire to find homes where they can enjoy their well-earned money under more favorable conditions than is possible on their isolated farms, is easily appreciated, and quite explains the migration of so many to near-by towns and cities.

Why many of them are finding their way to California and establishing delightful homes for their later years, can be appreciated best by those who have had some experience in the blizzards and zero weather of the long winters of that region, and then in this inviting climate.



Citrus Trees Exclusively

We have to offer for planting season of 1912 an excellent stock of strictly first-class Citrus trees in all varieties.

REMEMBER, MR. PLANTER, we have had twenty-one years of experience in the successful propagating of Citrus trees, and while our prices might be a little higher than our competitors, we absolutely guarantee our trees true to name. We are in the business to stay; hence, can back up what we say.

THINK WHAT THIS MEANS TO YOU. The average nursery is in business today and out tomorrow, so you have no recourse should anything go wrong. In addition to guaranteeing our trees true to name, we select our buds only from best individual fruiting trees, which would eliminate the possibility of having non-fruiting trees, or poor bearers in your grove. We follow the same plan of bud selection as the government experimental work.

Our trees are all budded from 3 to 7 inches above the surface of the ground, which will eliminate any possibility of planting the bud union below the surface of the ground.

Our booklet, entitled "Citrus Fruits," mailed to any address on receipt of 25 cents; credit given for this amount on first order.

Write us today for prices and information. All correspondence most cheerfully answered.

NITROGEN FERTILIZER FOR THE CITRUS ORCHARD.

By W. F. Sutherst, Ph. D., F. I. C.

Nitrogen is an essential ingredient of protoplasm, the substance contained in the living cells in the animal and vegetable kingdoms; a supply of this ingredient for the continued growth of cells is therefore necessary in the medium from which they absorb it. The cells composing the plant organs have different functions, and do not take up the same quantity of materials out of the sap. Some, such as the leaves, are capable of taking up a larger quantity of nitrogenous substance than the flower. When a large amount of nitrogen fertilizer is present in the soil we get a correspondingly large growth of leaf, and as other plant food ingredients are taken up as well, the rest of the plant, which needs them, suffers in consequence. Although a certain amount of leaf is necessary to manufacture vegetable matter for the plants' growth, still, in the case of fruit trees, where fruit is the object in view, an excess of leaf means loss to the grower. The orange contains just half as much nitrogen as the leaves or wood, so that a large application of nitrogenous fertilizer is unnecessary. In my opinion, the proportion of leaf to fruit in the orange tree is much greater than in other fruit trees, and in the case of evergreens it should be the reverse. A large leaf area means greater evaporation, and more frequent irrigation. Seeds store up considerable quantities of nitrogenous matter, and an orchard growing seedless oranges requires less nitrogen in consequence.

Nitrate of soda appears to be frequently used for citrus orchards, but there are numerous objections to its general use. For cereal and root crops it is largely used, but only as a tonic to tide the young crop over some setback, such as an insect attack, where a rapid growth for a short time will prevent the crop being entirely eaten up; another use is to overcome choking by weeds, but rarely as a continuous source of nitrogen. Being very soluble, it moves about readily in ground water, so that at one time tree roots are well supplied with it, at others it would be quite out of reach The evergreen citrus tree needs a constant supply of food, and consequently fertilizers constantly at hand. The soda in nitrate of soda is not needed in so great quantity by the plants as the nitrogen, so it passes out of the plant by the roots into the soil. Here it may unite with acids strong enough to neutralize it, or remain as "black alkali." The amount, however, is so small that it would take a long time to accumulate so as to be dangerous. By planting cabbages or other soda loving crops between the trees, it could be removed as fast as it formed.

The fertilizer next to nitrate of soda as regards efficiency is sulphate of ammonia. This apparently has not been used to any extent in citrus orchards, but in the Lomita High School experimental orchard it is on trial along with others. Sulphate of ammonia is slower in its action than nitrate of soda, and this is an advantage in evergreen trees, and though it is a very soluble salt, peculiarly enough, it does not move about with the soil water readily, but clings tenaciously to the soil particles. It first of all has to be converted by bacterial action into nitrate before the plants absorb it, and this only takes place in warm weather. As our rainy season is always during the coldest part of the year, when this action is arrested, practically all remains in the soil, whereas nitrate of soda would be washed away. There is no chance of alkali being formed by its use, as sulphuric acid is the rejected part of the salt, and this unites with the lime of the soil, forming a harmless substance.

It has not yet been proved that sulphate of ammonia is the ideal for citrus trees, so other fertilizers should be tried. One of these, dried blood, apears to have everything in its favor. It has to undergo considerable change before the plants can take it up, consequently is slow acting, much slower than sulphate of ammonia, and then it makes an excellent medium for bacteria to grow in. The bacteriologist uses meat broth to develop his specimens in, and dried blood, when dampened in the soil, is practically equivalent to it. We are aware that bacteria are necessary in the soil to convert complicated matter into plant food, and here is a substance to encourage their propagation, besides supplying humus to improve the mechanical condition of the soil. Neither of these are supplied by the chemical fertilizers. Wool and horn refuse are too slow acting to be of any use, and should only be applied when obtainable for nothing.

In mixed fertilizers it is desirable that all the ingredients be taken up at the same rate, or be of the same availability. This is impossible when nitrate, superphosphate and such substances are present, when one is liable to be washed out at the first rainfall, and the others are so slow acting as to last for years. This must be the cause of nonsuccess observed in many orchards where everything else seems to be in their favor.

Choose, then, some nitrogen fertilizer of a slow acting nature, not likely to be washed out of the soil, nor to bring about an abnormal growth when not required.

CITRUS TARIFF FACTS.

California is shipping 18,000,000 boxes of citrus fruits in 1911.

This fruit is produced by 10,000 farmers.

The citrus industry supports 150,000 people who are large consumers of the products of other states.

Fine California Seedless Navels, now eaten by everybody, are selling for $1.00 a box less than the seedlings formerly imported.

Fine, good-keeping California lemons are selling for less than imported lemons of four or five years ago. As the California lemon industry develops and the supply increases, the prices will be still lower because citrus fruits are perishable and must be sold.

As the cost of production consists largely of labor, the California citrus industry could not have developed without a tariff duty to equalize the cost of labor in this country and abroad.

This industry is the best illustration of the benefits of a protective tariff; it supports 150,000 people; it furnishes an important article of food for all of

the people; it has greatly improved the quality and has reduced the prices that prevailed when the consumer was furnished with imported fruit alone.

Without California competition the orange and lemon business would be in the hands of a small group of New York importers now combined with a small group in Italy to break down the home industry, and when so broken, to increase the price of lemons.

For the first time in American history foreign exporters have openly and brazenly organized, raised an immense slush fund and tried to break down an industry which is supporting an army of American people.

For the first time an organized foreign trust has had the audacity to attempt to corruptly shape legislation in the United States. What the trust would do if successful is shown by the price of lemons in Canada where there is no duty and where the retail price is as high as in this country.

Should they succeed in killing the industry in California they would make prices from day to day and the consumer would pay a higher price for a poorer quality of fruit.

During the heat of this summer when the importers in New York were reshipping the Italian lemons from New York to Europe to advance home prices, California shipped 1,000,000 boxes to the East and compelled a reduction of $3.00 a box between June and August.

Without this contribution from California prices would have soared to $10.00 or $12.50 a box, as did occur each year before California had a sufficient crop to compete, and the importers would have wrung millions of dollars from the suffering public.

The average wholesale price of Italian lemons in New York in August, 1911, was $2.60 per box, or less than 10 cents per dozen. The average wholesale price during August, 1910, when the importers had more complete control of the eastern market, was $3.67 per box.

SEEDLESS LEMONS.

Some time ago the daily press chronicled the discovery of seedless lemons at Rialto, San Bernardino County, hailing it as "a discovery of world wide importance, for it means that in years to come the lemon groves of California, and probably Europe, will be seedless." This started people in towns and cities to investigating their dooryard lemon trees, and since that time "seedless lemons" have been given prominent place on front page of the daily press. Since the introduction of lemons into California, seedless lemons have been produced. They are perhaps more common with the Eureka than other varieties, the Lisbon being quite seedy, but a good vigorous Eureka lemon tree will produce fruit of sufficient size so that it is picked entirely green and is usually seedless or contains only unmatured or partially formed seeds.

The Cultivator would not discourage looking for more perfect lemons, but investigators should bear in mind that more than a seedless lemon is required. Mr. C. H. Brown left at this office specimens of lemons which were practically seedless, others only partially formed. The fruit appeared to be from two different trees, one having largely the appearance of the sweet lime, the other being very large and an orange shaped fruit, juicy and valuable for home use, but it would not grade high because of its shape.

Don't give too many folks a piece of your mind. You may have none left for yourself.

FAITHFUL WORK.

The California Fruit Growers Exchange showed its appreciation of nearly a score of years of faithful service in that great cooperative organization when it passed resolutions regarding Earl F. Van Luven, of Rialto. After referring to his work, and the fact that Mr. Van Luven was one of the first members of the association and worked hard for the organization when the citrus industry was far from what it is at the present time, the board resolved:

"That this board of directors deeply regrets the severance of these relations that have existed so pleasantly and harmoniously throughout these many years, and recognizes that in the withdrawal of Mr. Van Luven it loses one of its most willing, efficient, staunch and able members."

NATIONAL QUARANTINE.

By A. W. Morrill, Entomologist Arizona Horticultural Commission.

The United States has been most fortunate in not having introduced and established within the country three fruit pests which are unquestionably far more serious than anything in this line we now have to contend with. These are so-called fruit flies and are commonly known as the Mexican orange maggot, the Mediterranean fruit fly and the melon fly. The first attacks the fruit of the orange, guava and mango; the second attacks practically every kind of fruit, being especially fond of citrus and stone fruits; the third attacks melons, cucumbers, tomatoes, beans and some fruits. The first occurs in Mexico, and the second and third are found in many parts of the world. The last two are of especial interest to western fruit growers, since they are found in the Hawaiian Islands.

That these fruit flies have not yet gained entrance to this country is largely due to the efforts of the California Commission of Horticulture. In the absence of a national quarantine and inspection law, such as practically all the leading foreign governments have in effect, California has had on its hands the work of self protection which has incidentally protected the entire country against insect pests arriving at California ports from the Territory of Hawaii and from foreign countries.

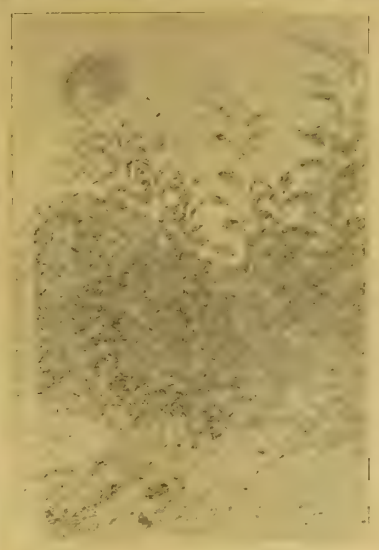
The fruit growers of California are greatly concerned at the menace to their great industry. In a circular recently issued by the California State Commission of Horticulture, Mr. O. E. Bremner, the secretary of the commission, summarizes the danger as follows:

"It is plain that shippers of fruit and those directly or indirectly interested in this industry, will not be guilty of in any way causing its establishment. The danger, therefore, lies with the unacquainted, unthinking, traveling public, who, in making a pleasure trip to the Orient, will bring in fruit to their friends, or for their own use.

We, therefore, solicit the aid of all of those interested to join with us in sounding at once a note of warning that may avert the catastrophe which seems imminent."

In writing of the melon fly Mr. Bremner states that in a single tomato from a shipment which he examined at San Francisco at the qaurantine station he counted seventy-nine maggots. In Hawaii, in July, 1902, he found that watermelons were selling for a dollar apiece owing to the difficulty in growing them successfully and protecting them against the maggots.

(Continued on Page 566.)



Citrus Trees

First quality trees will be scarce in 1912

The man who plants an orange or lemon grove is planting for a lifetime. Poor trees cannot be considered at any price if he wants good results. A few cents per tree saved at time of purchase often costs dollars per tree in after years.

Why not buy the best? The quality is there and remains long after the price is forgotten. We offer a limited quantity of strictly first-class, healthy trees, one year old buds, for 1912:

6500 Eureka Lemons
2000 Villa Franca Lemons
9000 Washington Navels
750 Valencias
500 Marsh Seedles Grape Fruit

Budded on sour stock roots, grown in loose soil, clean, vigorous trees, guaranteed true to name. These trees have been carefully grown, are straight, and extra care was taken in selecting buds from the best fruiting trees, the parent stock which is of proven prolific habit—thus insuring good bearing trees.

Longer life through seed and bud selection. The above cut shows what these trees were at the time of budding, October, 1910, measuring four to five feet high. The trees now show for themselves. A large portion of them measure from five-eighths of an inch to three-quarters of an inch and have been pronounced by experts to be the finest bunch of one year trees they have ever seen.

We invite inspection and comparison, and solicit correspondence. We will sell these trees at current prices. We will refund traveling expenses to any out of town purchasers. Twenty years experience in expert citrus horticultural work.

Dewey-Greenleaf Citrus Nursery

Telephone Chas. Dewey, residence phone "Sunset 113 R." | Twenty-sixth and Mountain Ave., Upland, San Bernardino County, Cal.

N. B.—These trees will pass inspection—no scrubbing.

Good Citrus Trees

Expert grown, large, clean stock, up to size now, for 1912 spring delivery. None better anywhere. Our buds are selected with greatest care from best individual fruiting trees and positively guaranteed true to name.

250,000 Seed Bed Stock

Sour, Sweet or Pomelo—the ***McMillan grown*** kind—large clean plants from selected seed—the kind it pays to plant. Inspection and correspondence invited. Closest nursery to Los Angeles. Alhambra car.

Deciduous Fruit Culture

CALIFORNIA NURSERYMEN.

The first fall meeting of the new organization of the California Association of Nurserymen came to a tragic close in the Chamber of Commerce building, Los Angeles, last Friday evening. The closing hour had arrived, and a woman over enthusiastic as to the issue of saloon or no saloon in the city of Los Angeles, asked for the privilege of one moment's talk. Apparently she did not understand that this was a state convention and not a meeting of local people, as she appealed to those present to vote against the Los Angeles saloon. As she was finishing, one of the folding chairs, according to the custom of its kind, collapsed, happening to be occupied by Mr. Biers, and Mr. Biers went down with a crash that was heard out upon the street. Mr. Biers arose and sedately inquired, "Wouldn't that jar you?" It apparently had him and created great merriment on the part of the assembled nurserymen.

There had been two days of strenuous work on the part of the members of the association and much had been accomplished which will be of value to the nursery and fruit interests of the state, and the evening was given over to a jolly theater party in which nearly all members joined, as guests of the California Cultivator and the Rural Californian. With Mr. Thomas in the lead, over fifty members marched into the Orpheum and showed the assembled people fifty of the yellow badges of the association. It was a pleasant ending of the two days' hard work.

We say it was a pleasant ending, and yet the next, the third and last day of the convention, was perhaps the pleasantest of all. It consisted of an automobile ride given to members by the Los Angeles nurserymen. It included visits to most of the nurseries around Los Angeles and Pasadena, and a trip through the magnificent grounds of Mr. Henry E. Huntington, east of the city of Los Angeles. These grounds cover over 400 acres with hill, valley and tableland, so arranged as to make magnificent landscape opportunities. Noontime found the bunch at Howard & Smith's Nurseries at Montebello, where lunch was served and where good fellowship held full sway for a part of the afternoon. The crowd broke with three cheers and a tiger for Los Angeles entertainers, and it was decided that if Oakland, the next place of meeting, hit the same gait Los Angeles has, the next session would be such as to attract nurserymen from all parts of the state.

But to go back a bit to the discussions in the Chamber of Commerce rooms. The principal feature of the convention was the resolution favoring a national quarantine. There was a little difference of opinion as to the particulars of enforcing a national quarantine, but on the one general proposition that a national law should be passed, there was absolutely no difference of opinion. With California producing from one hundred thirty to one hundred fifty millions of dollars worth of fruit every year, it is readily seen what a quarantine which is effective means to this state. There has been maintained a most thorough state quarantine which has been aided materially by the co-operation of custom service of the government, but the power of the state quarantine officers is not sufficient. It is notorious that Florida nurserymen use every means to send their goods to this state. They claim for them, of course, that they are free from any whitefly pest, but the State Commissioner of Horticulture has ruled that nothing shall be received in this state from those nurseries. Notwithstanding that, the postal department will not recognize the authority of state inspectors to any way hamper the free delivery through the mails of anything Florida sees fit to send. A national quarantine law would be effective as to receiving living plants from foreign countries and would also control interstate shipments of nursery stock. Many of the eastern nurserymen are fighting the national law. It will take united effort on the part of Californians to bring it about. The Cultivator will treat of this more fully in a later issue.

Considerable spirit was shown in the discussion of state and county quarantine, but with it all, good nature prevailed, and while nurserymen felt that there had been cases of discrimination and even the manifestation of ignorance on the part of many so-called inspectors, yet the general opinion was that the work of county and state inspectors should be sustained.

Many were greatly disappointed in the failure of Luther Burbank to appear before the convention. He was appealed to by wire and in every possible way pressure brought to bear to get him here, but he is a busy man.

Mr. Reeves' most complete list of conifers which have done well in California was discussed, and this list which had previously been given to the Southern California Horticultural Society, will appear in full in a later Cultivator.

In the matter of buying and selling amongst nurserymen, there was a little feeling expressed on the part of the Southern California citrus and ornamental tree growers because deciduous growers only allowed 20 per cent discount from list prices. They asserted this was not a sufficient discount to handle the goods and make any profit whatever. Some asserted that it meant almost certain loss to handle on such a narrow margin. The northern growers came back with the claim that if 20 per cent was not sufficient on deciduous stock, certainly 10 per cent, which is all the northern growers are granting on citrus stock, was not sufficient.

As noted above, the strongest resolution introduced was that referring to national quarantine, and among others were the usual expressions of appreciation to Los Angeles nurserymen as entertainers, to the press, the officers and others, for courtesies extended. All told, it was a royal meeting and every visitor felt well repaid for the visit.

The officers elected for the coming year are the temporary officers who perfected the organization and are as follows: President, W. V. Eberly, Niles; vice presidents, Leonard Coates, Morgan Hill; F. H. Wilson, Fresno; Fred H. Howard, Los Angeles; Almon Wheeler, San Jose; Thos. Chisholm, Pasadena; executive committee, Max J. Crow, Gilroy; E. Wightman, Chico; C. W. Howard, Hemet; secretary-treasurer, H. W. Krukeberg, Los Angeles.

EXPORTS OF RAISINS.

More than one milion dollars' worth of raisins were exported from the United States in the last fiscal year, the quantity, 18½ million pounds, being far in excess of the total exported in any earlier year. The imports during the year amounted to only 2½ million pounds, against 10 million pounds in 1900, and as high as 50 million pounds in certain years prior to the development of production in the United States. Comparing 1911 with 1900, the figures of the Bureau of Statistics, Department of Commerce and Labor show that exports grew from 2½ million pounds to over 18½ million pounds, and their value, from $140,000 to $1,069,000. During the same period imports of raisins fell from 10 1-3 million pounds in 1900 to 2½ million in 1911, and their value from $531,000 to $237,000. The largest exportation of raisins recorded in any year prior to 1911 was that of 1907, a little over 9 million pounds, or less than half that of 1911, while the largest importation of raisins on record is that of 1884, when a total of 54 million pounds entered the country, as against but 2½ million pounds in the fiscal year 1911.

Canada is by far the largest market for American raisins exported, the exports thereto in the fiscal year 1911 having been 11 million pounds, compared with less than three million to New Zealand, about 1 million each to England and Germany, and 3 million pounds to all other parts of the world. Of the 2½ million pounds imported last year, Spain, England, Asiatic Russia, and Asiatic Turkey were the chief sources, the first named country being credited with over 1 million pounds, and the others less than a half million pounds each. These figures contrast with those of 1884 when of nearly 54 million pounds of raisins imported, Spain was credited with 47½ million pounds; England, 3½ million; and Italy, nearly 2 million pounds.

The marked falling off in importations of raisins is the result of the rapid increase in domestic production, which first attained commercial importance in early "seventies." The American raisin industry had its beginning in the great San Joaquin Valley and certain counties of Southern California, which is still the chief producing area in the United States. In 1873 the California crop was but 120,000 pounds; by 1880 it had grown to 1,500,000 pounds; by 1890, 38,000,000 pounds; by 1900, to 90,000,000 pounds, and in the later years has risen as high as 140,000,000 pounds in 1907 and 1909, and fallen as low as 75,000,000 pounds in 1904, the figures for 1910 being 112,000,000 pounds. These figures of production are supplied by Mr. George Robertson, statistician of Fresno County, California, and are here quoted in the absence of official data covering the production in the United States as a whole.

The effect of domestic production upon imports and exports of raisins is clearly set forth in the figures which follow:

Period	Av. annual production (a) pounds	Av. annual importation pounds	Av. annual exportation pounds
1873-1881	780,000	35,300,000	.....
1882-1891	17,700,000	41,900,000	.....
1892-1901	81,200,000	12,700,000	(b) 3,400,000
1902-1910	111,660,000	6,700,000	5,900,000
1911	No data	2,500,000	18,700,000

(a) California crop only. (b) 1898-1901.

While these figures suggest a growing consumption of raisins in the United States, the per capita consumption is still but one-third as large as in the United Kingdom, Mr. George Robertson, the statistician above mentioned, being authority for the statement that the per capita consumption of raisins in the United States in 1910 was but 1½ pounds, compared with 5 pounds in the United Kingdom. Dr. Josiah Oldfield, D.C.L., Oxford, places raisins first among all known foods and superior to grapes "because the sugar has been thoroughly matured and ripened, and transformed ready for digestion."

The year 1910 was one of short production of raisins throughout the world. In 1909, when conditions were normal, four leading sources produced 333,000 long tons, of which Greek currants represented 185,000 tons; California raisins, 70,000; Turkish sultanas, 50,000 tons; and Spain, 28,000. Australia's product is mostly consumed in the home market, but the output is increasing.

EAT PLENTY OF GRAPES.

Eat grapes, ripe, sound ones, in abundance. Many people can make a whole breakfast off them and nothing else and feel the better for it. Don't be afraid of them. The grape-cure in Europe frequently causes a man's dyspepsia and dumps to flee away forever, and he feels as though he were made over again and were walking on air. It will do the same in America.

If anything is certain, it is that the food of civilization is changing somewhat, particularly in America. The heavy, stuffy, greasy foods of our ancestors are giving way to those which are lighter, more quickly digested. The American cannot afford to spend six hours digesting his dinner when he wants all the blood he can get for use in his brain to invent new machines, to write, or to plan commercial enterprises. Life is too short to give so many of the twenty-four hours up to the stomach.

Therefore, fruit, and a quantity of it, takes the place of sausage, "biled diners," mince pie, and green pork, or even the time-honored sheet-iron sandwich. 'Tis well. Man's stomach thanks him. The attention of economists, too, is recently called more and more to the limitless possibilities for food of the best quality for man that lie in nut culture.

HEALTHFULNESS OF APPLES.

Professor J. T. Stinson, director of pomology at the St. Louis fair, claims that the liberal use of apples will improve the disposition and elevate the moral nature, removing disagreeable feelings and making existence more enjoyable for all. He also maintains that eating raw apples is a cure for alcoholism and the tobacco habit. If all that he claims for the apple is true, the professor must certainly be regarded as a public benefactor. Dr. J. H. Kellogg thinks is would be a good thing for most persons if they would have a periodical "apple day," when the diet should be exclusively apples. Those who find themselves becoming irritable and disagreeable, might at least try this means of sweetening their disposition. Often they will relieve a distressed condition of the stomach. In case of mental fatigue, they are a wonderful tonic. We have made a lunch on apples and, while they do not have staying qualities, an occasional practice of this will be found beneficial generally. Apples in some form should be on the table at all times.—Green's Fruit Grower.

General Agriculture

MARKETING GRAIN AND LIVE STOCK IN THE PACIFIC COAST REGION.

The Pacific coast states ship their surplus grain to Europe rather than to the large markets of the Mississippi Valley; for the freight charges on the 19,000-mile voyage around South America are less than the railroad rates for a haul of some 2000 miles across the mountains and plains in the United States. In the first part of 1910, the cost of sending wheat from Spokane or Walla Walla to Liverpool, including railroad rates to Portland or Puget Sound, ocean rates, and marine insurance, ranged from 25 to about 30 cents a bushel, while the rate to Chicago from Spokane or Walla Walla was 34.5 cents a bushel.

The Pacific States thus occupy a unique position in the grain trade of the United States, and to some extent, in the live stock industry also, a position which no doubt will be changed after the opening of the Panama Canal affords new lines of transportation.

The present status and historic development of the grain and live stock industries of these states are discussed in a recent bulletin issued by the United States Department of Agriculture. The publication is entitled "Marketing Grain and Live Stock in the Pacific Coast Region."

Wheat growing in California developed with the large increase in population which followed the discovery of gold; the wheat crop in 1849 was about 17,000 bushels, and in 1859 it had reached nearly 6,000,000 bushels. Exports of wheat began in the early 50's; the annual average of exports from San Francisco for 1856-60 amounted to 400,000 bushels, including the wheat used to make the exported flour. The zenith of the wheat exports from California was reached in 1881-85, when their yearly average was 30,000,000 bushels. In 1906-10 this trade had declined to about 1,700,000 bushels, most of which was exported as flour. But meantime the Pacific Northwest had been increasing its crops so that the total exports of wheat (including flour reduced to terms of grain) amounted to 29,000,000 bushels a year from the Pacific coast during 1906-10. The development of California's agriculture along more profitable lines is one cause of the decline of its wheat production, and the increasing population providing a larger home market reduces still further the surplus for export.

A striking feature of the grain industry of the Pacific coast is the relatively high prices paid to farmers in regions of small production as compared with the farm prices in those regions which furnish the bulk of the crop. The average farm prices for wheat for two years ending with June, 1910, ranged from 81 cents a bushel in the valleys of the upper Columbia and the Snake rivers, to $1.28 for the mountain counties of eastern California, where but little wheat is raised.

Another comparison made in this bulletin shows a vast difference in the cost per ton-mile for transporting wheat, by different carriers, all of which share in moving this product to market. It costs a Pacific coast farmer an average of 20 to 25 cents per ton-mile to haul his wheat to the shipping point, while the freight rate over the route to England by way of Cape Horn is only from .02 to .03 of 1 cent per ton-mile.

The live stock industry of the Pacific coast is much older than the grain farming, being one of the main supports of California for at least half a century before the discovery of gold in 1848. But when crowds began to enter the state in the early 50's, the home supply was too small and cattle and sheep were brought in from distant places. Texas and even Missouri contributed to the herds and flocks that were driven across the mountains and deserts to the river valleys of California.

The usual method of buying live stock, at the present time, west of the Rocky Mountains, is direct from the stock grower. The purchaser is often a packer who buys for his own slaughtering. There is some marketing done in public stock yards, notably at Portland.

Details of the growth of domestic and foreign trade, of prices on the farm and in various markets, of freight rates, and transport facilities are brought out in the statistical tables of the bulletin.

IMPORTS OF POTASH SALTS IN THE UNITED STATES.

The recent announcement by the Department of Agriculture and from other sources regarding discoveries of large supplies of potash in the United States, lends interest to a statement prepared by the Bureau of Statistics, Department of Commerce and Labor, showing that the importation of potash salts is now running at the rate of over a million dollars a month and has aggregated since 1900 approximately 75 million dollars. While these potash salts enter the country in various forms and thus under various titles, including muriate of potash, sulphate of potash, carbonate of potash, kainit, etc., their aggregate import value in the nine months ending with September, 1911, was 11½ million dollars, against about 7 million in the corresponding months of 1910 and a little over 5 million in the corresponding months of 1909, thus indicating a steady and rapid growth in the importaion of this class of products. Taking the figures for fiscal years, the total for 1911 was 14 million dollars, compared with less than 12 million in 1910, less than 4 million in 1900 and less than two million in 1890.

The principal classes of potash salts imported into the United States are, in the order of magnitude of imports in the fiscal year 1911: kainit, 1300 million pounds; muriate of potash, 431 million pounds; sulphate of potash, 106 million pounds; carbonate of potash, 23 million pounds; nitrate of potash, or crude saltpeter, 9 million pounds; caustic potash, 7 million pounds; and all other salts of potash, 6 million pounds. Measured by value the largest importations during the year occurred in the muriate, 6½ million dollars; kainit, 2 2-3 million; the sulphate, nearly 2 million; and the carbonate, ¾ million dollars.

American farms absorb a large proportion of the imported potash salts, most of which are valuable as fertilizers by reason of their large content of potash. This is especially true of kainit, muriate of potash, and the sulphate of potash. Nitrate of potash, or crude saltpeter, is chiefly used in the

Rayo LANTERNS

Your Best Insurance
against accident when driving along dark roads is one of our famous Rayo Driving Lamps.
Rayo Driving Lamps will not blow or jar out.
They are smaller than other driving lamps, but have a magnifying power that throws a bright light many feet ahead, while the extra large ruby disc in the rear is readily discernible in any weather.
Rayo Driving Lamps are furnished with double side bracket attachments, to fit square or round posts. They can be used on all kinds of vehicles.
In addition to Driving Lamps, the Rayo line includes lanterns of all styles, sizes and finishes—each the best of its particular kind. All are equipped with selected Rayo globes, with wicks inserted in burners ready to light.

The Rhubarb and Berry Specialist c

When writing advertisers, mention Cultivator

manufacture of gunpowder and nitric acid; caustic potash, in the manufacture of soap; and carbonate of potash, or "potash," as popularly called, obtained largely from the ashes of certain land and marine plants, is used in the manufacture of soft soap, for cleansing purposes, in dyeing, and for the emulsifying of oils; while the chemical and other industries utilize the foregoing and other potash salts in the preparation of drugs and medicines and in other technical processes.

Germany is the chief source of kainit, and, indeed, of all the imported potash salts except crude saltpeter. Of the muriate imported in 1911, 431 million pounds, Germany supplied all except 3¼ million pounds received from Belgium and 1½ million pounds from the United Kingdom, most of which was, in each case, presumably, of German origin. Practically all the imports of sulphate of potash are from Germany, and of the 23 million pounds of carbonate of potash imported in the last fiscal year, Germany is credited with 16 million pounds, compared with less than half that sum from all other European countries. In the case of nitrate of potash, or crude saltpeter, however, British India is the chief source, that country being credited with over 9 million pounds out of a total importation of 9¼ million pounds in the fiscal year which ended June 30, 1911.

CANADA THISTLE.

One of the worst weeds in the state of Washington is the Canada thistle. This plant is distinguished from the common bull thistle by its small heads and its long, running underground stems. The bull thistle comes up from the seed, lives over one winter, produces flowers and seeds the second year and then dies. The Canada thistle lives on from year to year, sending up new shoots from the underground parts, storing up new food below ground and thus establishing itself very firmly. Fortunately very few good seeds are produced and the weed does not spread to any great extent from place to place by seed. Only occasionally is a new start made. It does, however, spread from a center in every direction in a field, as the underground stems grow, and a small piece of one of these stems dragged by a plow or cultivator will start a piece in another part of the field.

To eradicate this weed requires careful effort. First of all, every sign of it must be hoed out and all the underground stems removed that may be. The plot must then be carefully watched, and as fast as new stems come up they must be hoed off. The sending up of a stem uses some of the food which is stored below ground. If this stem is removed before it can establish itself, spread out its leaves to the sunlight and manufacture new food, in time the underground stems will be starved out, but if the new shoots are neglected more food will be manufactured and stored, and the whole fight must be begun again. If this work is carried out with great care one should be able to eradicate the thistle in a single growing season. —Bul. 3, Washington State Ag. Ex. Sta.

A NITROGENOUS FERTILIZER.

A subscriber in Brighton, Colorado, wishes to use a nitrogenous liquid fertilizer, and asks about sulphate of ammonia. Sulphate of ammonia is readily soluble in water, and may be used by adding a teaspoonful of sulphate to a gallon of water. Avoid applying it too often. Perhaps a better liquid fertilizer is made by adding a teaspoonful of nitrate of soda to a gallon of water. The nitrate is also soluble in water, and supplies nitrogen that is at once available for use by the plants. It does not unite with the other chemicals in the soil, and in consequence is liable by over-watering to be washed out through the drainage hole at the bottom. Both of these articles are in concentrated form, and before dilution must not be allowed to come in contact with the roots or stalks, as this would be injurious to them. It should be applied in small quantities, and its effect will be seen within a day or two. It should be borne in mind that these nitrogenous manures, when used, tend to produce foliage rather than flowers or fruit, especially when the soil is lacking in lime and other mineral elements. In such cases bone meal is advantageously used, being mixed with the surface soil before the liquid is applied. While making use of these concentrated manures, it is well to bear in mind that if applied too strong or too freely, they are liable to do more harm than good. It is far better to err in using too little than in using too much of these fertilizers.—Ex.

RUSSIAN THISTLE.

(Salsola kali tragus.)

The Russian thistle (Salsola kali tragus), is not a true thistle, but is a tumble weed. It entered the state of Washington about 15 years ago and has not been very rapidly distributed. It, however, occurs in some places on the summer fallows and in other places to a considerable extent in waste land. In a few cases it is making trouble in wheat fields.

The Russian thistle is an annual, that is, it goes to seed each year and then dies down. Fortunately, it makes its flowers and seed late in the summer after the grain crop has been removed. It should be prevented from going to seed by being cut after the grain has been taken off. If it is allowed to go to seed, the piles of weeds should be burned and the young weeds killed by clean cultivation.

Live stock, especially sheep, eat the weed freely while it is young and thrive well on it.

There is no great difficulty in eradicating this weed if reasonable care is taken.—Bul. 6 of Wash. Ex. Sta.

ENFORCING SQUIRREL EXTERMINATION.

From Assistant Secretary of the State Board of Health, John F. Leineu, we have the following concerning procedure necessary to secure enforcement of the squirrel extermination act:

"County Board of Supervisors must be formally requested to enforce this law and to take all necessary measures to fully notify all landowners in their respective counties of their intention to enforce it. In view of the wording of the act, it might be well for you to communicate with your county officials direct. The state board of health would also like to hear from you further concerning these matters.

"It is also suggested that you communicate with P. A. Surgeon W. C. Rucker, 111 New Montgomery St., San Francisco, who has charge of plague eradicative measures and squirrel extermination on the Pacific Coast."

Seventy thousand boxes of apples have been placed in cold storage in Sacramento to wait for the higher prices of spring. Of course they are largely from the Pajaro Valley.

Pansies

"Pansies for Thought"
and
C. C. Morse & Co.'s
Pansy Seeds for Planting

Obtained from the best European specialists. Sun ripened. Splendid mixtures and separate colors. Send for our giant

"Prize Strain Mixture"

and see what a beautiful Pansy bed you'll have.

Our 1912 Garden Guide is now ready—it's a compendium of great value. Send for it today.

C. C. MORSE & CO.
1 MARKET STREET SAN FRANCISCO

LILLY'S SEEDS

These 3 Vegetables for 10 Cents

This is not a bargain, but an introductory offer to get you interested in Lilly's Seeds, and to prove to you their quality and reliability.

LILLY'S "DELICIOUS" LETTUCE. A variety introduced by us, very early with fine, hard, medium-sized heads, rich yellow heart, with a delicious buttery flavor.

LILLY'S "EARLIEST OF ALL" RADISH. A very small, round, bright red radish with white, crisp flesh of a delicious, mild flavor. An excellent variety for cold frame.

LILLY'S "NEW WHITE QUEEN" ONION. A very early, small, round variety of fine, crisp flesh, with a deliciously mild flavor. A great favorite for the home garden, easily grown and matured.

The above three varieties are all regular 10 cent packages. We offer the three for 10 cents to introduce. Send money order or stamps.

Catalogue Ready for Mailing, Free

Send for a copy of Lilly's Annual Seed Book, 126 pages, fully illustrated with cultural directions.

Lilly's Seeds are the Standard of the West. They have given satisfaction to farmers for over a decade. They are particularly adapted to the climatic and soil conditions of the West Our seeds are tested by us before being offered for sale. We have an expert seed tester, a government graduate.

Chas. H. Lilly Company, Seattle, Washington

ALFALFA SEED

New crop seed, recleaned. *No Alfalfa Weevil* where this seed was grown. Samples and quotations on request.

BULB PLANTING is now in full swing and our second shipment of Holland Bulbs has arrived. It consists of Anemones, Ranunculus, Iris, etc. Ask for our Free Bulb Catalog containing full Cultural Directions for California. Our "Hints on Gardening" and Seed Catalog also mailed free on request.

Morris & Snow Seed Co.
425 So. Main Street, Los Angeles, Cal.

J. H. Hale, the "Peach King," writes: "THE DOUBLE ACTION 'CUTAWAY' is a splendid tool. I use it in polishing off my peach orchards several times a year. A good pair of horses handle it all right."

The genuine "CUTAWAY" tools are used and endorsed by successful orchardists from coast to coast and bay to gulf.

In orchard work the driver can cultivate under the trees and below the low limbs, the horses not interfering with the branches. The double levers give the driver full control of tool at all times. For regular farm work the gangs can be drawn together.

CUTAWAY DOUBLE ACTION ORCHARD HARROW

Every orchardist and fruit grower should have one or more of these labor savers and fruit makers. They will positively pay for themselves in one season. To investigate is to be convinced.

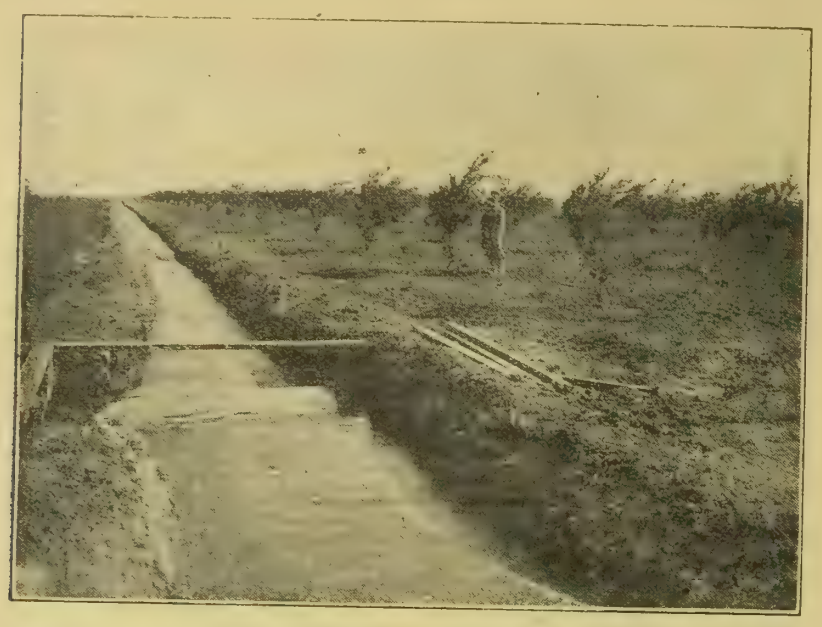
Thorough cultivation makes large crops. Stirring the soil lets in the air, sunshine and new life, and kills foul vegetation. The "CUTAWAY" disk slices, stirs, lifts, twists and aerates the soil. CLARK'S "CUTAWAY" TOOLS run lighter and do better work than any other machine. Lasts a lifetime.

Send today for new catalog, "*Intensive Cultivation.*" Of course, it's free.

CUTAWAY HARROW COMPANY
977 MAIN STREET HIGGANUM, CONNECTICUT

The Building of a Modern Little City

The picture occupying the front page of this issue of the Cultivator, is a photographic reproduction of a section of the main canal of the irrigating plant which furnishes the water for the Patterson Irrigated Farms, at



Patterson, Stanislaus County, California. This irrigating system is what is known by irrigation engineers as "a pumping plant." In other words, the water for these canals is elevated from the San Joaquin River by powerful centrifugal pumps, operated by electric power which in turn, is supplied by water power in the Sierra Nevadas and is produced at a very cheap rate.

There are five of the main canals having a total length of over five miles. There are also five separate pumping stations which in turn elevate the water to the next canal. At the end of each canal is a solid concrete reservoir, the combined capacity of which is over 5,000,000 gallons. These reserovirs operate as a storage reserve of water which can be pumped into the canals during the night in the irrigating season and drawn against during the day time to supplement the work of the pumps.

The canals and pumping plants were designed and installed of a size and capacity to supply more than an ample supply of water for all the land under irrigation. The canals are of solid concrete, twenty-six feet wide at the top and tapering to a point at the bottom. They are, without the shadow of contradiction, the finest irrigation canals in this country. Their construction does away entirely with the troubles that beset the ordinary type of irrigating canals such as the growth of obnoxious weeds, the boring of gophers which causes the dreaded and expensive washouts, the continual repairs, etc., that are continually required to keep the "mud-ditch" in operation.

Patterson is situated on the main line of the Southern Pacific railroad, ninety-seven miles south of San Francisco on the San Joaquin River. It is comparatively a new town, but is growing very rapidly as the result of the subdividing and sale of the great Patterson wheat ranch at that point.

This great tract of over 18,000 acres of wonderfully rich land lies along the San Joaquin River in the heart of the beautiful and fertile San Joaquin Valley, about midway between the Coast Range and the river. The history of the wonderful transformation scene now taking place there reads like a page taken from one of the fairy tales which delighted us when we were children. Eighteen months ago this tract was one vast wheat field, with not a building in sight except a few ranch houses. The site of the present modern station of the Southern Pacific Railway was marked by a post with a small sign reading, "Patterson," and was merely a flag station where local trains stopped when flagged to let off or take on the people who worked on the different great wheat ranches in the vicinity.

At the present time there is being built a modern city, with paved streets, concrete sidewalks, a $25,000 school building, a $20,000 bank, a $20,000 hotel, many good stores and scores of dwelling houses, some of which cost up into the thousands of dollars to construct. There is a complete water system for domestic use and fire protection and the streets are filled with building material and mechanics of every kind. Everything is on the move and the spirit of doing things seems to take hold of every person who is in any way connected with the place.

The same thing applies to the colony as well. Nearly two hundred families are now located on the tract and are busily engaged in either building homes, planting orchards or seeding the land to alfalfa. Several thousands of acres are now being seeded to this money-making crop and six months from this date the bare fields of stubble will be transformed to a vast carpet of nature's most glorious green.

Patterson is delightfully located, being midway between the mountains of the Coast Range and the river, or to be exact, three miles from each. The land is very level, having a perfect slope of eighteen fet to the mile from the mountains to the river, thereby making it an ideal irrigation proposition. The mountains here are beautiful, changing daily as the result of different atmospheric conditions, and are filled with valleys and canyons which abound in small game and are the mecca of hunters from different parts of the state.

The river at this point is also a continual delight, not only on account of the immense groves of great oak and willow trees but also owing to the picturesque scenery along its banks. Its waters teem with fish of many kinds including the striped bass and salmon, and appeal especially to many for that reason, as boating or fishing is a favorite pastime with many of the people.

A most beautiful grove of California oaks, covering many hundreds of acres along the river's bank, has been set aside by Mr. Patterson, the owner, for the exclusive use of the residents of Patterson city and colony. It is a magnificent gift and will be a source of pleasure, not only to the pioneers of the present generation, but to their descendants for all time to come.

The San Joaquin River is one of the great rivers of California and furnishes a never failing water supply for the Patterson irrigated farms. It has its source in the eternal snow fields of the mighty Sierra Nevadas and is supplemented by the hundreds of smaller streams that drain that great watershed. This river supplies the one essential necessary to make the rich soil of this valley produce the enormous crops of grain, fruits and alfalfa which have made California the wonderland of this hemisphere.

This is not only the age of irrigation, but it is also the age of intense farming. Without irrigation this valley produces one immense crop of wheat or barley. With irrigation the same land will produce from six to eight crops of alfalfa and all kinds of fruits and nuts which reach their highest state of perfection on this coast.

Both the soil and climate of this particular part of the San Joaquin Valley are especially adapted to the cultivation and production of the very best quality of the English walnut, which will be made one of the leading industries by the colonists of this place. The fact that the trees can be planted on the "water checks" and not interfere with the growing of alfalfa during the time that the trees are reaching the age of full bearing, appeals strongly to the small farmer. In this way the alfalfa will not only pay for the land itself, but will also take care of the evpense of the planting and raising of the walnut orchard as well.

You will notice from one of the accompanying pictures the remarkable growth of an apricot orchard in one year. It is pronounced by experts in that line to be the greatest single year's growth ever shown in this state of wonderful growths. Apples, prunes, pears, peaches, plums and berries of all kinds, show the same remarkable growth and a fine orange grove planted last year looks as sturdy and promising as anything shown in the lower part of the state.

The irrigation system at Patterson cost more than a quarter of a million dollars and after its completion the eighteen thousand acres of great wheat ranch was subdivided into five, ten and twenty-acre tracts which are being rapidly sold for fruit and alfalfa farms. Many of the leading dairymen of the state are buying large holdings there, knowing that just as soon as the water was turned onto that rich soil there would be no superior place in the country in which to make money raising alfalfa and turning it into butter fat.

One of the most important things concerning the rapid sale and development of the Patterson farms is the fact that the water is sold with the land. That is, one share of stock in the irrigation project is deeded with every acre of land sold. For example, a person buying twenty acres of land would receive twenty shares of stock in the irrigation plant. When the land is two-thirds paid for, the control and management passes into the hands of the farmers on the colony, and the cost of water is simply the upkeep and operation of the system, which under its perfect construction and cheapness of maintenance will be very reasonable, indeed.

The Payne Investment Company are the selling agents, with offices at Patterson, and they are meeting with great success in their manner of making the sales. The very easy terms they are able to give to purchasers is a factor that enters largely into the rapid sale of the land. A purchaser is only required to pay one-fifth of the price down and is given eleven years in which to pay the balance. This makes a great opportunity for the man with small means to buy a small farm and let the land not only support his family, but pay for itself at the same time.

There is a great movement on the part of the people of the middle western states particularly towards California and the big Panama Exposition of 1915 will add greatly to their number. These people are wandering up and down the state looking for good lands and many of them are buying at Patterson. The land there is the equal of any in the state and is bound to increase many times over in value in the next five to ten years. There is very little land in the state the equal of that at Patterson, that has an abundance of water that can be gotten at so little cost, and fortunate indeed is he who takes advantage of the present opportunity and secures one of these fine farms while they are cheap and on the market. The selling agents have descriptive literature, etc., pertaining to the proposition which they will be glad to mail to any address for the asking. All inquiries should be addressed to the Payne Investment Co., Patterson, Cal.

(Continued on Page 568)

American Pumps Again Selected for the Patterson Ranch

The Reason Why

Because the success of the whole project depends on the successful operation of the eight pumping stations.

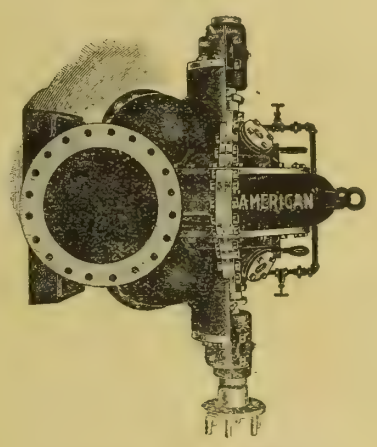
Because, recognizing this, the Patterson Co. employed the BEST ENGINEERS in the country to design the plants and select the pumps.

Because the Engineers knew that the first cost of the pumps was a small item compared with the cost of operation and maintenance, and that therefore GUARANTEED EFFICIENCY must be the determining feature in selecting the PUMPS to be used.

This was WHY AMERICAN PUMPS were selected for installation in the first FIVE STATIONS PUT IN 2 YEARS AGO.

BUT while the efficiency of a new pump can be tested at the factory, ONLY TIME CAN PROVE what the pump will do when working day in and day out. TWO YEARS SERVICE PROVED THEIR LASTING QUALITIES and ELEVEN MORE AMERICAN PUMPS are now being installed.

The Pump



AMERICAN PUMPS
are the ONLY Pumps in use in the PATTERSON COLONY IRRIGATING SYSTEM

"IRRIGATION BY PUMPING"
Containing description and pictures of this, the Model Pumping Plant of the West, will be sent on application to

What It Means to You

What is true for this pumping plant with pumps having a combined capacity of 200,000 GALLONS A MINUTE and costing over a QUARTER OF A MILLION DOLLARS is true for the smallest isolated irrigating plant in the country.

GUARANTEED EFFICIENCY AND LASTING QUALITY are what count.

You may not feel that the size of your plant justifies the expense of an expert engineer and exhaustive tests. Then PROFIT BY THE EXPERIENCE and expense of the Patterson Company and do as they did—

BUY AN AMERICAN PUMP, even if it costs a little more.

They did so two years ago, and after TWO YEARS SERVICE they have done so again.

BUY AN AMERICAN.

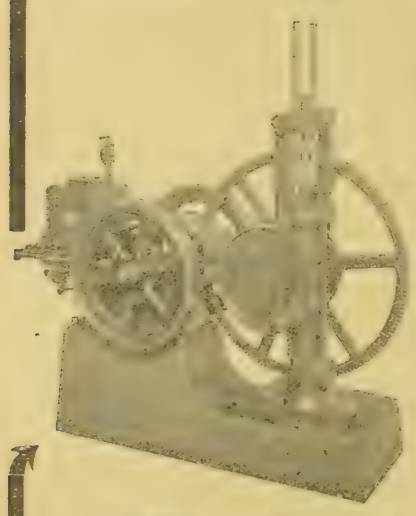
Have You Seen **Gregory's Triumph Engine**

With Direct Connected Pump Jack?



If you have not, you have not seen the latest thing in a perfect little pumping plant. Note the simplicity of this jack; direct lift each side of the piston; no wobbling or jerking, but a smooth, even stroke. Engine is fitted with pulley, so that you can run the washing machine, the churn, the cream separator, and be such a handy little helper about the place.

We have them in 1 and 2 h.p., and don't forget that we carry a very large stock of engines and pumps of all sizes. Come and see us, or send for catalogue.

WM. GREGORY, Sales Room
602 to 606 N. Main St., Los Angeles, Cal.

Simplicity—Economy—Efficiency
NO ELECTRICITY—NO CARBURETOR

Not in competition with other engines. In a field to itself.

WHY?

What's a goose-quill got to argue about with a fountain pen, only that it one day "wuz all there wuz." Now, it's different. Look closely at the cut and note the absence of cams, yokes, gears, batteries, carburetors and mixing devices, and other complicated parts to get out of order. Unbelievable? Will an engine run on kerosene or distillate, for less than any other engine on the market, forward or backward, and at less expense, and without batteries, carburetor, and so simple that a boy can operate it?

We don't ask you to buy an engine from this advertisement or from any correspondence or representations that we may make; we ask investigation.

We want you to see our engine in operation, let the engine show for itself and when anyone "just chirps" engine in your hearing, we want to have you tell them about the engine YOU SAW, and we leave it to you as to the engine you buy. Demonstrations daily. Free circulars. Write today.

The Simple Oil Engine Company
412 Pacific Bldg. San Francisco, Cal. 114 East 8th St., Los Angeles, Cal.

Irrigation and Forestry

WORK THE ENGINE MORE.

The slang expression of the city, "Let George do it," has been paraphrased in the country to "Let the gasoline engine do it." No other single factor has been more potent in making every penny and every minute and every stroke count in farming. The gasoline engine has lifted from the shoulders of the farmer many a burden that taxed his strength and subdued his mental energy. It has given into his hands a means of dispensing with the horse and the forces of the wind. It has been a suggester and a creator of new and important methods of utilizing power on the farm. The man with a gasoline engine is the antithesis of the man with the hoe. Human genius has accomplished no greater extremes. The one was dependent upon all the world; the other is independent of all the world.

The gasoline engine is not a hired man who eats his head off, for the fuel cost of running one is small, being only about one and one-half cents per horsepower per hour, when gasoline is bought for fifteen cents a gallon. Hitched to a multiplicity of devices and machines it is transforming the work of the farmer and changing him from a slave of the elements into the master mechanic at whose bidding the whirring wheels and purring belts perform the onerous work of many human hands. Nothing could be better testimony to the manner in which the gasoline engine has revolutionized the life of the farmer than this statement of a grain-belt farmer who found that it does, indeed, pay to let George, in the form of a gasoline engine, do it:

"My father used to feed cattle and he always shelled all the corn he fed, using self-feeders for the cattle. The cobs were used for fuel and they were very nice to start fires with. He used a two-hole corn sheller and an old eight-horse power, but used only two and four horses on it. On account of old age and not longer being able to run the farm he retired from farm life and moved to town. The corn sheller and power were left on the old homestead, and I moved onto it and used them. Often when I wished to shell corn the track would be very muddy for the horses and the old power would run hard, as it was getting all out of line, and I decided to investigate gasoline engines.

"I was expecting to get about a three or four horsepower, but I secured prices on different sizes and ordered a seven horespower. The factory sent a man to install it and start it. I have been running the engine ever since, and have never had an expert or anyone else to examine it, and it runs just fine. I run a four-hole corn sheller, feed grinder and two pumps; one is sixty rods and the other is 150 feet from the engine, and I can have water for my stock whenever I want it, wind or no wind. I grind a great deal of chicken feed in the spring for my neighbors and at the same time pump water for the stock, and what I charge for grinding helps pay for the gasoline, and a very small quantity of gasoline is required to do all the work. I would not do without the engine for almost any price if I could not get another.

"In 1905 I had a room built near the dwelling, secured a small two-horsepower gasoline engine, and this runs the churn, washing machine, and the house pump from the well, which is forty-four feet deep, while I have a double-cylinder force pump and have hose handy, which in case of fire can be attached to the engine. My two smaller girls, eight and fourteen years of age, can start the engine, and Monday morning, while the engine is running the washing machine, my wife can sit and talk over the telephone, or rest in the rocking chair and read the news."

A gasoline engine may be put into motion by a novice. Once started, it will run half a day or all day without attention. When it stops it requires no care until needed again. The time necessary to feed a team of horses daily will easily keep a gasoline engine in running order. The expense for fuel and lubricants will not exceed the value of the daily oats supply of a pair of working horses.

The gasoline traction engine has put out of commission the old-time horsepower at thrashing time. And when the work is finished it pulls the separator and attendant wagon to the next job. It does the same thing at corn shelling time, at clover hulling, and again at the hurry-up task of silo filling. It pulls a road drag, or leads a string of loaded wagons to market, as occasion may demand. It pulls stumps. It snakes out old hedge roots in a way that is a caution. It plows, disks, harrows and reaps. In a pinch it can be called on to do a dozen other things equally well.

The traction idea is in a measure responsible for the earlier and more generally adopted plan of a centralized power, or one large engine with sufficient motor force to do all the various work of the farm. This system called for a convenient grouping of all the machines to which the power was to be applied. The arrangement had many advantages to commend it. It had also disadvantages, and these spurred the inventive genius of gasoline engine producers to the perfection of means of disposing of them.

Every grain grower has painful recollections of the inconvenience, damage, or actual loss of an oats crop because the ground was so soft that a binder could not be gotten through it. Now a little gasoline engine, a specialist, if you please, is mounted on the machine and furnishes power to run the binder machinery. This removes the greatest part of the draft horse-killing and nerve-wrecking from the horses, and reduces their work merely to that of getting the machine over the ground. This little engine alone makes it possible at times to save crops that would otherwise go to loss.

Other inventors directed their attention to the adjustment of engines to other special purposes. The field is a wide one, and the results of the work done by these specialists in gasoline power application has been and is of constantly increasing importance. So popular has this plan of individual motors become that farms are frequently equipped with a full complement of engines, each of which is devoted to a specific purpose. Baby engines run the washing machine and the sewing machine. Others are designed as motive force for cream sep-

arators. The family of pumping engines is a prolific one. Still larger ones are adapted to grinding and heavy work.

The utility of the gasoline engine is beyond question. Its adaptability to the purposes of farm work is practically limitless. Its simplicity and ease of operation commend it to those unfamiliar with machinery. Its economy of fuel is a final clincher in its behalf.—Wisconsin Farmer.

LUBRICANTS.

Lubricants include two classes of compounds, oils and greases; the first being liquid, the second semi-solid or solid at ordinary temperatures. According to their origin, oils are classified as mineral, animal and vegetable; according to their use, as cylinder, dynamo, engine, machine, etc.

In selecting an oil, it is important to consider the purpose for which the oil is to be used, since its properties should be suited to its particular use. An oil suitable for heavy, slow-running machinery is not suitable for light, rapid-running machinery. A cylinder oil should not decompose at the steam pressure used, as would be the case in using a lard oil; the decomposition resulting in the formation of a fatty acid which acts destructively upon the cylinder.

The viscosity, or degree of fluidity of an oil, is important, as this determines the rate at which the oil will feed.

The color of an oil has very little relation to its useful properties, since oils can be filtered through bone black, treated with nitric acid to remove the "bloom," etc., and thus considerably changed in appearance while remaining inferior in particular lubricating qualities.

It is important that an oil, besides having suitable viscosity and specific gravity for the purpose intended, should be free from acid, and from substances which cause gumming; also, have a sufficiently high "fire test." The presence of free acid in an oil can readily be determined by shaking up a small portion of the oil with warm water, and then placing a piece of blue litmus paper in the water. If the paper turns red, acid is present. As any free acid acts injuriously upon metals, any oil containing it should be rejected. "Gumming" may be caused by cotton-seed oil, castor oil, linseed oil; hence they should not be used in lubricating oils. Rapeseed oil, olive oil, palm oil and colza oil are much better for compounding lubricants.

The majority of lubricating oils are mixtures of mineral and animal or vegetable oils. For ordinary machinery, mineral oils, neat's-foot, lard, tallow and heavy vegetable oils should be used. A rancid oil is not suitable for lubrication. For the reason before given, a mineral oil alone is best suited to cylinders; at most it should contain but a small percentage of vegetable or animal oils.

"Set" or axle greases are made by treating mineral and rosin oils with lime, thus converting them into greases. Boiled greases are made by treating cotton-seed oil, horse-fat, or other suitable oils, with the proper amount of lime necessary to combine with the fatty acids. A neutral boiled grease is the best lubricant for heavy and medium-weight machinery.—G. W. Walker, Assistant, Agricultural Chemistry and Soils, Minn. University Farm.

THE ELECTRIC MOTOR.

The possibilities of electricity on the farm are coming to be more and more recognized every day. Not only are more farm homes and outbuildings being lighted by electricity than ever before, but all over the grain belt electric motors are being installed which do the work formerly requiring several men and horses. Some of the farm machines to which electric power is being attached successfully are feed grinders, fodder cutters, fanning mills, grindstones, circular saws, corn shellers, silage cutters, horse clippers, milking machines, cream separators, churns, feed mixers and numerous other useful machines and implements.

Some idea of the work which a small electric motor can do may be gleaned from the following: Twelve horsepower will drive a grain separator. Three horsepower furnished all the power needed to make 6000 pounds of milk into cheese in one day. Six horsepower will run a feed mill, grinding twenty bushels of corn an hour. Five horsepower grinds twenty-five to forty bushels of feed, or ten to twelve bushels of ear corn an hour. Seven horsepower drives an eighteen-inch separator, burr mill and corn cob crusher and corn sheller, grinding from twelve to fifteen bushels of good, fine meal. Twelve horsepower will run a sixteen-inch cutter and blower and elevate the silage into a silo thirty feet high at the rate of seven tons per hour. One horsepower will pump water from a well of ordinary depth in sufficient quantity to supply the ordinary farm house and all the outbuildings for the ordinary uses.

These figures show the possibilities of electricity as a hired man on the farm. It is inevitable that this power will come to be more and more used on the farms of the grain belt in the next few years. There is an awakened interest in water power development and in the subject of electricity in general. All over Iowa, for example, engineers are being secured to make estimates as to the amount of power which can be developed from water falls and rapids. The same thing is going on in other grain-belt states. Farmers are reading of the power which lies idle in brooks and rivers. They are becoming interested in the subject. It is inevitable that generalities will give way to details before long and the electric motor come to be recognized as one of the most useful factors in farm life before much more time has passed.—Wisconsin Farmer.

Several olive planters are investigating conditions as to growing olives in Madera.

CONSERVATION OF WATER POWER.

Investigations of possible sites for developing water power on the public domain are being pushed by the United States Geological Survey, with resulting withdrawals of land from entry where it is found that valuable sites exist. In July 31,725 acres of such land were withdrawn, including a great number of power sites. No estimate has been made of the horsepower involved, but owing to the character of the power sites withdrawn it is believed to be very large. These July withdrawals make a total outstanding area withdrawn of 1,546,258 acres, based on the examination and recommendation of the Geological Survey, and involving thousands of power sites and doubtless millions of horsepower. The withdrawals are made in aid of proposed legislation by Congress which shall provide for the fullest possible development of these enormously valuable properties and at the same time guard the public interests.

Nitrate of Soda

We are prepared to furnish Nitrate of Soda at the lowest market price, and will be pleased to quote prices and furnish literature to anyone interested, on application.

Dr. R. R. Snowden will at our expense, advise our customers as to how to use the fertilizers for the best returns, even if the soil has to be analyzed to do so.

State what crops you are interested in, and mention the CULTIVATOR.

CONTENTS THIS WEEK

CEMENT-LINED IRRIGATING CANAL, Cover.

MIDDLE WEST FARMING TODAY AND 35 YEARS AGO, 545.

CITRUS AND TROPICAL FRUITS.—Nitrogen Fertilizer for Citrus; Citrus Tariff Facts; Seedless Lemons; Faithful Work; National Quarantine; 546, 547.

DECIDUOUS FRUIT CULTURE.—California Nurserymen; Exports of Raisins; Eat Plenty of Grapes; Healthfulness of Apples; 548, 549.

GENERAL AGRICULTURE.—Marketing Grain and Live Stock on Pacific Coast; Imports of Potash Salts; Canada Thistle; Nitrogenous Fertilizer; Russian Thistle; Enforcing Squirrel Extermination; 550, 551.

IRRIGATION AND FORESTRY.—Work the Engine More; Lubricants; Conservation of Water Power; Irrigation Resources of California; 554, 555, 567.

EDITORIAL.—Citrus C. of C.; Rivers and Harbors; Municipal Farming; Better Farm Life; Heavy Tax; Control the Evil; Why Not California; Farmers' Institutes; Standing Firm; Political Commission; 556.

AGRICULTURAL NEWS NOTES OF THE PACIFIC COAST.—Northern; Central; Southern; The Coast; 557.

LIVE STOCK AND DAIRY.—Dehorning Cattle; Ringing Pigs; Drying Off the Cow; Butter Scoring Contest; Live Stock Insurance in Sweden; 558, 559, 560.

PROFIT IN THE POULTRY YARD.—A Defense of the Fancier; Instructions in Poultry Raising; Scratching Material; The Setting Hen; Stanislaus Poultry Show; C. C. C.; When Hens Do Best; Additional Stockton Winnings; San Diego Show; Oakland Poultry Show; 561, 562, 563, 563.

QUESTIONS AND ANSWERS.—Buffalo Bugs; Dynamite for Subsoiling; Defective Walnut Shells; 567.

LEGAL.—Trespassing Stock; 567.

HIUSEHOLD DEPARTMENT.—The Old Gray Turkey's Nest; Digestion and Health; Scotch Humor; Antidote for Toadstool Poisoning; The R. F. D.; Equipment Means Economy; 569, 570, 571.

PRODUCE MARKET.—Los Angeles Market; San Francisco Market; Deciduous Market; Citrus Market; 572, 573.

CITRUS C. of C.

The citrus producing section of Tulare County has an organization which promises much of great value, in fact, has already been of value, to that section. It is a Citrus Chamber of Commerce made up largely of growers and having to do with commercial features of the industry as well as cultural work. There are some live wires in that section and if all the growers would join in such an organization we imagine it would be the means of adding great strength to the industry. It is simply additional proof of the helpfulness of co-operation. The next meeting will be held at Terra Bella.

RIVERS AND HARBORS

The National Rivers and Harbors Congress opens its three-day session in Washington next week. The National Congress also convenes at that time, and presumably the effort on the part of believers in improvement of rivers and harbors will be directed toward discussing matters which may be brought before the national lawmakers. In the words of its call, its object will be: "To put forth its utmost endeavors to crystallize, in the minds of congressmen, the vital necessity for a continuation of the policy adopted by the Sixty-first Congress of an annual river and harbor appropriation bill."

MUNICIPAL FARMING

The municipality of Fresno is engaged in farming operations which are proving profitable. A sale was made last week of 3000 tons of alfalfa hay at nine dollars per ton in the stack. This hay was raised on a sewer farm, so that it was the result of what in most cities would have been worse than a waste. We say worse than wasted, because it costs money to dispose of sewage, but in Fresno's case, the waste is turned on fertile land where nine dollars per ton hay is raised. The farm has earned for the city during the past year about $9000, and during the year 200 additional acres have been planted to alfalfa.

BETTER FARM LIFE.

It is true that agriculture in the United States has reached a very high level of prosperity; but we cannot afford to disregard the signs which teach us that there are influences operating against the establishment or retention of our country life upon a really sound basis. The overextensive and wasteful cultivation of pioneer days must stop and give place to a more economical system. Not only the physical but the ethical needs of the people of the country districts must be considered. In our country life there must be social and intellectual advancement and social betterment. We must try to raise the average of farm life, and we must also try to develop it so that it shall offer exceptional chances for the exceptional man.—Theodore Roosevelt.

HEAVY TAX.

It is said that the citrus growers of California are paying approximately one million dollars a year in fighting scale and other insect enemies of the orchard. We suppose this tax will continue indefinitely, but there is an attractiveness in the search for the bug to eat the bug. If this great burden of the citrus growers can be lessened in any degree by the use of the state's money in the search for parasites, it certainly should be encouraged. The saving from one such beneficial insect has made possible the citrus industry which is now bringing to the state between thirty and forty million dollars every year. Had not the enemy for the white scale been discovered, we do not believe the citrus industry would now be on a profitable basis. We believe there is no other instance showing such marked results, and there never may be again. Admitting that, yet the effort may be justified by some results.

CONTROL THE EVIL

We are informed that several suburban dairies, or rather people having two or three cows, have been mercilessly imposed upon in many recent instances. Districts outside of Los Angeles have been good picking for sharpers who have purchased cows from dairies, which, under the tuberculin test have reacted and have been discarded by the dairies to be picked up by the sharpers who sell to the unwary. Sometimes these cows boast a long pedigree and perhaps come from a fine strain. The uninformed regard them as exceptional bargains at the prices asked. Some cases have been reported where the seller must have known the condition. When these cows have been proved to be non-producers and worse, losing in flesh and otherwise showing ill health, and have been tested by veterinarians, some have been found to be in the last stages of tuberculosis. We do not know whether there is a state law to prevent this traffic, but if not, the state legislature should see that the situation is corrected.

WHY NOT CALIFORNIA?

The Redlands Review recently referred editorially to Yucaipa's "New Home Day" and commented on the display of apples which "was unusually fine; we doubt very much whether the Hood River Valley could do better." Now, why the Hood River Valley? California produces more apples than the Hood River Valley and all the rest of the state of Oregon and all the state of Washington in addition. Not only California does this, but one tiny valley of Santa Cruz County produces more than these two states. Yet our own state papers when they rise to the climax of apple production go to "Hood River." The recent apple show at Watsonville was the finest exclusively apple exposition ever held. We do not say this because it was a California endeavor, but after conversation with judges of such expositions who have visited them all the way from Madison Square to Watsonville. The Sebastopol show was another exceptional exhibition. Far away sections are invested with the glamor and enchantment of distance, but California papers should bear in mind that in apple production we have the greatest little apple producing section in the world.

FARMERS INSTITUTES

J. B. Neff reports farmers institutes at Colton, Dec. 11; Bloomington, Dec. 12; Highlands, Dec. 13-14; Redlands, Dec. 15-16; Beaumont, Dec. 18; Banning, Dec. 19; Coachella, Dec. 20.

January 15-19 a special farmers institute school will be held at Imperial. This is the first effort of the kind in California and the results will be watched with much interest. During the five days Prof. Bioletti will make addresses on adaptability of certain soils to grape vines, influence of locality, preparing land, planting, and general care of vineyard. Presumably these will have special reference to conditions in the Imperial Valley. Dr. Twombly will handle dairy matters and animal industry. The strongest feature of this work will be chemistry of feeds and general feeding hints. Prof. Shaw will give instruction along the line of agronomy, treating particularly of the necessity of humus in the soil, of general grain and alfalfa culture, also sugar beet possibilities of the Valley. Prof. Lipman will give instruction along the line in which he is known to be so eminently well qualified, that of life in the soil as relating to soil fertility. It is hoped that Mr. Petersen of the government experiment station near Bard in the Yuma Reclamation district, will be present and talk upon the experiments recently made with cotton culture. These experiments have been very instructive, especially as to adaptability to California conditions. Mr. W. E. Packard, for years connected with the University work in the Valley, will of course be on hand, for Mr. Packard is an enthusiast in matters agricultural in the Imperial Valley. He will talk upon irrigation and reclamation of alkali lands and other matters which will apply to local conditions.

STANDING FIRM

The walnut growers of Southern California are showing their long headedness by sticking to the price generally conceded to be just at the beginning of the season. The brokers started in and have persistently endeavored to break the price. When no sales are made the growers quietly put the nuts in storage and go about their other business, letting the buyers wait for their nuts. Of course there are some outside of the association who may have sold out under the schedule adopted, but we are assured that not a single association has broken away from the established price. The report that members of the association are selling for less than fourteen cents is presumably an effort to disrupt the local association as well as to batter down the price If there is anything the eastern buyer has no use for it is a co-operative organization of producers. Unfortunately walnut men are not so firmly united as they should be; their operations are not upon such a firm foundation as is the business of the California Fruit Growers Exchange, but it is hoped that this work of the brokers will result only in a closer knit relation between communities.

DID IT PAY?

We hired a man once because we noticed that he spoke pleasantly to his team. It was a small thing, but the straws show which way the wind blows. He stayed with us three years—only left to go onto a farm of his own—and all that time we never heard a curse, or saw a blow struck in anger. The stock did better during those three years than it had done for a long time. The cows looked more thrifty, the horses grew less skittish and restless and even the young stock settled down into regular, sober habits. Did it pay? Try it yourself and see.—Exchange.

If you allow your neighbor's tempting price to lure you into selling him the choicest heifers from your herd, it will be but the question of a few years when he will be offering stock for dairy purposes that is in every way superior to your own cows.

Breeding a gilt at less than one year of age stunts her in her growth at a time when she should be developing the most rapidly. She will never make the sow she might have, had she been bred at twelve or more months old.

Agricultural News Notes of the Pacific Coast

Northern California

Arbuckle, Colusa County, will plant 50,000 almond trees this season.

Irrigation ditches are being extended in the Los Molinos Colony, in Tehama County.

Fair Oaks, Sacramento County, reports the biggest orange crop in its history.

Two hundred acres of eucalyptus are being planted by a Yolo County company.

Butte County oranges are being exhibited at the Western States Land Show in Chicago.

The Supreme Court has sustained the legality of irrigation bonds issued in South San Joaquin County.

A representative of the Rivers and Harbors Committee of Congress has been inspecting the San Joaquin River.

Marysville, Yuba County, is hoping for the establishment of a hundred thousand dollar meat packing house.

Yolo County stockmen have received 2700 head of Mexican cattle which will be pastured in Yolo, Lake and Solano Counties.

Hay growers over the Sacramento Valley who have not already disposed of their output are jubilant over present prices.

Meridian, Sutter County, hopes for the removal of the sugar factory and refinery at Alvarado, Alameda County, to that section.

The deciduous fruit league is proceeding with its organization under the direction of former State Commissioner J. W. Jeffrey.

Fruit growers of the northern end of the state are seriously discussing "Shall the Japanese control the Northern California fruit markets?"

Two trainloads of cattle were received last week by one concern at Williams, Colusa County, the cattle to be pastured on the ranges of the company.

One of the oldest apple orchards in California is being made into stove wood at Chico. These trees were planted about 50 years ago by John Bidwell.

Land owners of the Lisbon district in Yolo County will spend $80,000 in the construction of a concrete levee. It is said to be the first of its kind in the United States.

The State Attorney General will soon commence suits against the land owners along the Sacramento River near Rio Vista, the lands to be used in the widening of the channel of the river.

The work of removing wooden bridges over ditches and of installing concrete siphons under the roadway is continued in the holdings of the Sacramento Valley Irrigation Co. in Glenn and Colusa Counties.

Horticultural Commisisoner C. R. McBride of Solano County reports a small infestation of Russian thistle along Putah Creek, two miles east of Winters. Mr. McBride says that, so far as he knows, it is entirely isolated, and we doubt not will be controlled.

Professor Cook, the State Horticultural Commissioner, announces that stronger efforts than ever will be made to prevent the entrance of the Mediterranean fruit fly. A Californian will go to Honolulu and aid in the fight there in the hope that the pest may be suppressed.

Central California

Tulare County is raising some fine broom corn.

Fresno County's Emperor grape shipping season has closed.

Ducks are reported to be leaving the Tulare Lake section and going toward the ocean.

Tulare County olive growers are shipping most of their pickling olives to Los Angeles.

One prune grower at Exeter reports he has a $600 per acre profit from his three acres of prunes.

Raisin growers the valley over are indignant over the efforts of packers to bear the raisin market.

Grangeville, Kings County, recently held a Chrysanthemum Carnival which was a "Blooming success."

The Salinas Chamber of Commerce reports 2000 acres pledged toward the cannery project for that city.

Work on the irrigation system at Oakdale and the South San Joaquin irrigation district is being pushed.

Lodi closed the season with a greater number of table grapes shipped to its credit than any preceding year.

During the months from April to October 3,185 tourists entered the Sequoia National Park, and 2,212 General Grant Park.

Fruit growers near Watsonville entered suit against buyers to secure balance due on apricots delivered. The amount asked was granted by the court.

The Counties League of boosters of Monterey, Santa Cruz and San Benito County, is asking for government aid in reclamation of the lands in those counties.

A committee appointed by the Governor to devise some means of marketing to better advantage the irrigation bonds of the state, met recently at Stockton.

It is thought that the present scourge of rabies which is infesting all kinds of livestock in Fresno County had its origin in the large number of infected skunks.

T. A. Griffin of Merced, shipped his second carload of black-eyed beans to El Paso, recently. The car contained 40,000 pounds, or 500 sacks. The beans were all grown in the vicinity of Merced.

The Tulare County Dairymen's Association has resolved to grade the cream into first, second and third. This will doubtless result in a much higher standard for butter from that section.

The Board of Directors of the Tulare Irigation District is claiming from the city of Tulare the expense made necessary by the removal of an irrigation ditch ordered by the city trustees.

The annual stockholders meeting of the Lucerne Cream & Butter Co. was held last week at Hanford. The board for the coming year consists of M. J. Caeton, G. A. Dodge, L. F. Burr, J. S. Nisbet and J. H. Dawson.

The bean producing fields of Stanislaus County aggregate 70,000 acres and these produced the snug sum of over two million dollars this year. The average yield per acre is about twelve sacks. Prices to the growers have been running $3.60 to $3.80.

Southern California

Imperial farmers are busy seeding alfalfa.

Beaumont boosters are preparing for a good Farmers Institute next month.

The Milo maize crops of the Imperial Valley are exceptionally heavy this year.

The recent Imperial Valley Fair at El Centro drew out a fine exhibit of poultry.

Elsinore has a walnut tree with a credit of 400 pounds for this one season's output.

Pasadena, Los Angeles County, realizes $10,000 from walnuts grown on its sewer farm.

Vineyard men at Cucamonga held a meeting last week and discussed matters for the coming year.

Several wells for irrigation water have been sunk in the neighborhood of Elsinore, Riverside County.

Coachella Valley dairymen are to establish a creamery at Thermal. It will be in sharge of C. A. Ball.

San Bernardino is already planning to hold its Second National Orange Show during the third week of February.

The Warner ranch in San Diego County is filing on all the water flowing in the San Luis Rey and Santa Ysabel Rivers.

The Orange County sheriff has returned to walnut growers at Anaheim about $300 worth of nuts taken by walnut thieves.

The Southern California Beet Growers Association is now comprised of owners of about forty thousand acres of sugar beet land.

The new lemon packing house at Bloomington, San Bernardino County, is now working on lemons and its equipment is found to work satisfactorily.

Goleta, Santa Barbara County, has already shipped about a thousand tons of walnuts which means about $240,000 to the grower. This year's output is the greatest ever.

Owing to complaint of neighbors in the vicinity of the Pasadena sewer farm that municipality is discussing the advisability of disposing of its hogs and raising mules instead.

An exchange complains because of the contest over the proposed state highway that so many communities are "dragging it around over the state that the poor roadway will be all worn out."

Commissioner Beers of Santa Barbara County reports regarding the Santa Maria section that his investigations "disclosed very encouraging conditions as to fields which were formerly infested with noxious weeds."

The request of the Lima Bean Growers Association of Ventura County that Governor Johnson take steps to secure the manufacture of bean bags at the States Prison jute mill resulted favorably and the prison board has granted the request.

In quoting from its issue of 30 years ago, the Riverside Press gives an item showing that raisin producers of that section were at that time netting seven to eight hundred dollars per acre. Times have changed since then and Riverside as a raisin producer is not particularly noted.

The Coast

Arizona more than doubled its output of barley during the last ten years.

Many Eastern homeseekers are looking over farming land near Wilcox, Ariz.

The Salt River Valley, Arizona, will plant 1300 acres of cantaloupes next season.

A co-operative peach factory is to be established at Parker, near North Yakima, Wash.

Quite extensive plantings of walnuts are being made by farmers of Baker County, Oregon.

Coos County, Ore., is rapidly changing from general farming to a fruit producing section.

Farmers of the Puget Sound Country are organizing for co-operative marketing of their products.

For the first time since the Russo-Japanese war, Puget Sound millers are shipping flour to Siberia.

The Idaho College of Agriculture is taking steps to enforce the pure seed law of that state.

The Colorado State Bee Keepers Association will hold its annual convention Dec. 12 and 13 at Denver.

Spokane is experiencing its first snowfall of the season, there now being about two inches on the ground.

Dairymen at Redmond, Ore., have organized and are determined to receive better returns for their products.

Arizona has declared a quarantine even on household goods from the alfalfa weevil infested districts of Utah.

Waterville, Wash., held its first potato exposition last week, and there were exhibits from all parts of the state.

Re-surveying the lands near Parker, Ariz., is under way. This is a part of the scheme looking toward throwing the lands open.

The annual Territorial Fair at Phoenix showed the greatest attendance ever granted and the exhibits of livestock were especially large.

A hundred thousand dollar corporation has been formed at Wilcox, Ariz., for the purpose of developing and irrigating lands of that section.

An almost unanimous vote was cast last week at Kettle Falls, Wash., in favor of an irrigation district, the waters to be taken from the Colville River.

The department of poultry husbandry of the Oregon Agricultural College claims a record for two hens which have produced during twelve months 259 eggs each.

Farmers of Colorado are raising a fund to pay the salaries of three professors of the Agricultural College who cannot be retained because of shortage of the appropriation.

Farmers near Springfield, Ore., are protesting against the establishment of an irrigation district, for they claim their lands are more valuable for general farming than for fruit growing.

The work of surveying and subdividing irigable lands of the Colorado River Reservation began last week. These lands are near Parker, Ariz. Besides the lands to be allotted to Indians there will be about 150,000 acres opened to white settlers.

MAN MUST EAT
There is money in
SUGAR and CATTLE

Share in the profits of an agricultural investment, comprising over 21 square miles of rich agricultural lands.

The land has an abundance of water in a district where irrigation, drought and frosts are unknown. Large tame grass pastures have just been prepared.

The land is free from incumbrances, which affords our investors the highest degree of security.

THE PRODUCTS OF THE RANCH ARE CATTLE AND CANE SUGAR, TWO OF THE WORLD'S BIGGEST DIVIDEND PAYERS, AND ON WHICH THE MARKET IS STEADILY ADVANCING.

In this district lean cattle fatten in four months in tame grass pastures and increase 50% to 100% in value.

Cane sugar is manufactured at one-third the cost of beet sugar.

Additional capital is required for improvements and to buy cattle to stock the ranch. A limited amount of investment certificates will be issued in units of $100 cash or on installments. Six per cent per annum interest is guaranteed, and we also share the profits with you. Option given to withdraw your money and profits or to become a part owner of this great property.

Applications for certificates will be filed in the order received. This enterprise is backed by some of the most substantial and well-known business men of Los Angeles. We invite the strictest investigation.

Send for free booklets and descriptive literature.

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

DEHORNING CATTLE.

By O. E. Reed, Kansas Agricultural College.

In the ordinary business dairy herd there are many reasons why animals should be dehorned. Dehorned cows give better results than cows with horns, simply because they are more peaceable and do not fear one another. At one time, the cows needed their horns for protection, but in this age they are cared for and have no use for their weapons. They often do a great deal of harm by injuring members of the herd and making attacks on people. The only case where it is advisable to leave the horns is when raising high-class animals that are likely to be used for show purposes. In the show ring the animals with horns have a better chance for prizes than those animals that have been dehorned.

The best time to dehorn an animal is when it is only a few days old by using caustic potash. But after the horns have made a fair growth they can best be cut off with the saw or clippers. The animals should be fastened securely in a position where the operator can get at the horns. The best method for fastening the animal is to put it in a chute built for this purpose. In sawing or clipping the horn care should be taken to cut deep enough or the horn will grow out again. The clipping should be deep enough to include the ring of skin and hair; and the base of the horn that is amputated should show a ring of hair. As soon as the horn is cut off some disinfectant should be used on the fresh cut. Pine tar or some of the coal tar dips are good for this purpose. Dehorning should be done in late fall or early spring; at this time the weather is moderate and the flies do not bother the animals.

The reason as often given for not dehorning dairy cows is that it will cause them to fall off in their milk flow. If the cows are properly cared for after they are dehorned they will soon recover from the shock of dehorning and the decrease in milk flow will not be as apparent as often is thought.

Twelve cows in the herd at the Kansas State Agricultural college were recently dehorned and a record of the milk production of each cow was kept before and after dehorning. The total production of the twelve for five days before dehorning amounted to 1145.5 pounds of milk. The total production of the twelve cows for a period of five days after dehorning was 110.7 pounds of milk. The total decrease in milk for the twelve cows during the above periods was 40.8 pounds. The daily loss for each cow for five days was only .69 pounds, or about one-half pint. Two of the cows made more milk during the five days after dehorning than they did for the five days before dehorning; the other ten produced less milk after dehorning. On the fifth day after dehorning all except two cows were producing equally as much and some produced more than they did the day before they were dehorned.

Don't forget that the hogs can be overfed. Overfeeding the porkers is an easy matter and excess of feed leads to diseases of the blood, liver and bowels.

UTILIZATION OF FEED BY CATTLE

It is a fact of common knowledge that marked differences exist between individual animals as regards the returns which they yield for the feed consumed. A current statement is that a good feeder has a greater digestive power than a poor one, or that the power of assimilation of the one animal is superior to that of the other, and it has been assumed that the advantage of the better type of animal lay in its ability to produce more flesh or fat from a unit of feed than could the poorer one. It has also been commonly taught, and seems to be generally accepted by animal husbandmen as an established fact, that young growing animals not only make actually larger gains than more mature ones, but likewise more economical gains.

The influence of type and age upon the utilization of feed by cattle has therefore been investigated by officials of the Department of Agriculture and the result published in Bureau of Animal Industry Bulletin No. 128.

Two steer calves were selected as the subjects of this investigation, one a purebred typical beef animal of one of the well known beef brands, the other a "scrub" of mixed breeding. Exhaustive feeding trials were carried out with these animals, including twenty-four experiments with the respiration calorimeter. Finally the steers were subjected to a slaughter test, whereby the quality of the meat and the relative size of the various cuts were accurately determined. The work is therefore important alike to the practical feeder and the agricultural scientist.

The feeding stuffs used were of the same kind for both animals in all the periods, and the different grains used were mixed throughout in the same proportions for each steer. At intervals during the time the digestibility of the total ration and the nitrogen balance were determined for each animal.

During each of the three winters covered by the investigation four experiments were made on each animal by means of the respiration calorimeter in order to determine the percentage availability of the energy of the feed consumed. During the first winter, that of 1904-05, the feeding stuffs used differed from those employed during the ordinary feeding. In the succeeding two winters the grain feeds used were the same, only the amount differing.

While the results fail to show any material difference between the physiological processes of food utilization in the two animals, they do show clearly an economic superiority of the pure bred over the scrub steer, due, first, to his relatively smaller maintenance requirement, and, second, to his ability to consume a larger surplus of feed above the requirement. Both of the facts tend to make the actual production of human food in the form of meat and fat per unit of total feed consumed by the animal notably greater by the pure bred animal.

In the case of the pure bred animal especially, and to a less degree in that of the scrub, rations containing less available energy and notably less digestible protein than the amounts called for by the current feeding

GOMBAULT'S
CAUSTIC BALSAM

A safe, speedy and positive cure for

Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a HUMAN REMEDY for Rheumatism, Sprains, Sore Throat, etc., it is invaluable.
Every bottle of Caustic Balsam sold is Warranted to give satisfaction. Price $1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

standards for growing cattle produced entirely satisfactory gains in live weight.

A distinct influence of age upon the maintenance requirement was observed between the ages of 14 and 39 months, the requirements decreasing relatively as the animals matured. The gain in weight of the scrub as compared with that by the pure bred steer consisted more largely of protein with its accompanying water and to a smaller extent of fat, and therefore represented a materially smaller storage of feed energy. This was also indicated by the results of the block test.

The animals were killed on January 4, 1908. The scrub was rated as "common," and the pure bred was graded as "prime." The total dressed weight and the weights of the several wholesale cuts show the considerably higher percentage of dressed weight in the case of the pure bred which is characteristic of the beef animal, and likewise the predominance of the loin cut over the less valuable cuts of the fore quarter in the beef animal as compared with the scrub, and the marketable meat of the retail cuts showed that the proportion of more valuable cuts was notably greater in the pure bred.

RINGING PIGS.

Many people who keep pigs do not find it necessary to subject them to the operation of inserting rings in the snout, but there are cases where it is quite impossible to restrain the animals from "rooting" unless the snout is operated on in such a way that digging causes sufficient pain to induce the animal to desist. Some breeders claim that pigs should be rung from the time they are weaned, but this is not a wise plan; indeed there is no reason why it should not be deferred until the necessity for it arises.

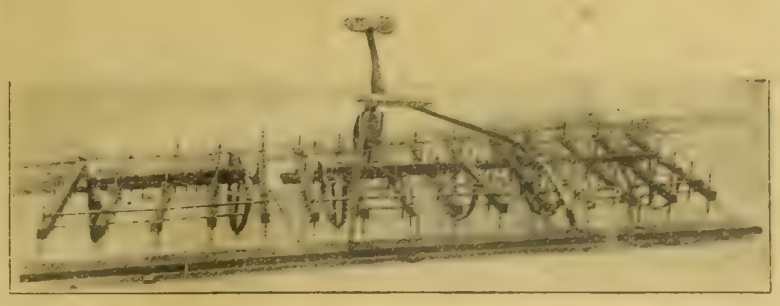
The operation, if skilfully performed and with proper tools, does not take long, and is probably not particularly painful. Certainly the pain actually caused must not be measured by the protests offered. These are always loud, but a pig will make just as much noise over taking a dose of castor oil as having his nose slit. Still, there is sometimes cruelty in neglect to attend to any soreness caused. Festered noses, about which pig men as a rule trouble very little, should be seen to, as otherwise unnecessary pain is caused. Besides, the health of the animal will suffer. When the animals are fed on any very sticky food it will often accumulate round the ring, form a hard lump, and cause soreness. A simple remedy for this is to turn a few peas into a trough of water. While the pigs are searching for and securing these the accumulation gets soaked and soon rubs off.—American Cultivator.

DRYING OFF THE COW.

Answering a question as to applying camphor to a cow's udder to force drying off, Hoard's Dairyman says: "Camphor certainly has the effect of tending to dry off milk secretion; so has fluid extract of belladonna leaves. Camphorated oil rubbed in when drying off a cow helps in the work and leaves no bad effect. The same may be said of belladonna. Belladonna may also be given internally where there is difficulty in drying off milk flow. It is most used for drying off brood mares after weaning of foals."

Opposition to a few reasonable reforms by a few crooked dairymen, not only brings the dairy industry into bad repute, but turns people from the use of dairy products.

The New
20th Century Harrow
Patented



This Shows a 3-Section (90 Teeth) Six-Horse Harrow

This unexcelled, improved, automatic, self-cleaning harrow, which can be operated by a twelve-year-old boy, is a great labor saving device.

The above illustration shows with what ease harrowing can be done by this method, as a riding cart is attached to our harrows, and the operator simply presses a foot lever when he desires to clean the harrow from rubbish, and then the harrow cleans itself automatically.

The old method of cleaning harrows, requires a great deal of strength and labor, as every farmer knows, and by nightfall the operator is exhausted, while with this new invention there is no strength or hard labor required.

Our standard seasoned oak frame harrow is five feet long, five bars to the section (30 teeth to the section), and as many sections as are desired can be used. The illustration also shows a rear action which may be desired by some farmers. This action is extra. It drops to the ground while the main harrow is in the air cleaning itself.

You can use the teeth from your old harrow, as we can supply the harrow complete without teeth. Holes for the teeth bored to order.

The self-cleaning attachment can be purchased separately and you can attach it to your old harrow. The riding cart can also be purchased separately.

This self-cleaning attachment can also be supplied for traction purposes. It is equally good for light and heavy work.

Any size harrow made to order. Write for prices.

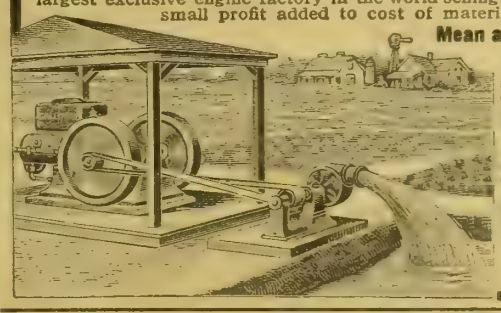
GALLOWAY
Pumping Engines and Centrifugal Pumps

MAKE the most economical and efficient pumping outfits on earth where large quantities of water are required. Galloway Pumping Engines are made in sizes to suit every purpose from 1½ h. p. to 15 h. p. They are built on honor, and so powerful, simple, economical and reliable that they are acknowledged everywhere as the most all-around satisfactory gas power possible to obtain. They are built in the largest exclusive engine factory in the world selling direct to the consumer with just one small profit added to cost of material and labor.



Mean a Saving to You of From 40 to 60%.
Galloway Centrifugal Pumps on account of the high efficiency obtained, their exceptionally simple design without valves or other complicated mechanism of any kind, are the ideal pumps for irrigation purposes or where large quantities of water are required.
A combination of Galloway Engine and Galloway Centrifugal Pump means ideal equipment at a great saving in price as compared with competitors prices.
Write us for full information. We have a special department for irrigation work with experts ready to work out your requirements.

IN BUYING A PUMP YOU SHOULD CONSIDER THE

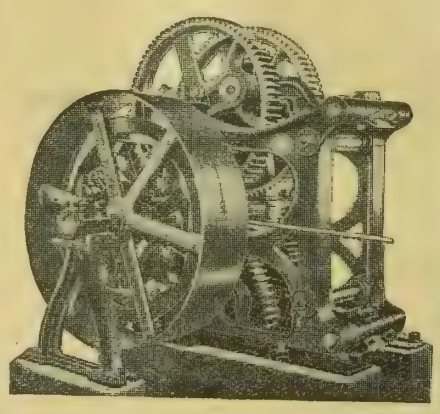
Reliability

OF THE CONCERN BEHIND THE PUMP

POMONA DEEP WELL PUMPS

are the standard of reliability and efficiency, and can be depended upon to do their work with less trouble than others. Some of them have been pumping for 10 years with the same pump heads. They are manufactured by a company who have the equipment and ability to build their machinery in a first-class manner and to install them satisfactorily to their customers.

OF THE PUMP ITSELF AS WELL AS



This cut is a side view of the New Pomona Pump showing friction pulley and out poard bearing.

PROMPT REPAIRS

One of the great advantages of using Pomona Pumps is the ability to secure repair parts promptly. We carry in stock all needed parts and can furnish same or send men to make repairs at short notice.

A few days ago the Italian Vineyard Company at Guasti (to whom we sold a large pumping plant) accidentally broke a beam at 3 o'clock in the afternoon. They immediately telephoned us and we sent a new part by express on the 5:05 p. m. train. The casting was put in place and the pump running in good shape by 9 o'clock that night. It is service like this that counts. You might break a part in the midst of YOUR busy pumping season, where a few hours' delay might mean several hundred dollars loss. Write us for literature or come to Pomona and see us.

BUTTER SCORING CONTEST.

By Leon M. Davis.

The butter scoring highest in the sixth and last entry for the year 1911 came from the Dairy Delivery Company of Gustine. Inspection of the sixteen entries revealed that many of the butter makers have not yet adapted their methods of making to the conditions of the season, for one of the general defects was faulty body. Just now, when many cows are well along in their lactation period and when dry feed is being fed, the condition of the butterfat in cream and in butter makes harder the incorporation of moisture, with the result that some buttermakers work their butter in the water, while others use high washing temperatures, either of which may cause defective body. Gummy body, weak body and poor grain, were the common criticisms offered, all of which can be avoided by the buttermaker. In spite of the cooler weather there was present in a number of entries, the same old cream flavor which was prevalent during hot weather. So long as dairymen can not be prevailed upon to take better care of their cream, or creameries do not insist upon frequent delivery, this undesirable flavor will be found. In cold weather, care must be used in the dairy, for although cream may be sweet, it may still have bad flavors. The butter was scored by Mr. Thurston, E. H. Hageman and Leon M. Davis as follows:

Sixth Entry.

Creamery and Location	Score
Dairy Delivery Co., Gustine	95
Suisun Creamery, Suisun	94
University Farm, Davis	93½
Delta Creamery, Imperial	93½
Laton Co-op. Creamery, Laton	93

Glenn Co. C. S. & Cr., Willows	92½
Cottonwood Cr., Cottonwood	92½
Berkeley Butter Co., Berkeley	92
Ceres Creamery, Ceres	91½
McFarland Cr., McFarland	91½
Cal. Poly. Sch. Cr., S. L. Obispo	90½
Santa Ysabel Cr., Paso Robles	90½
Salinas Cr., Salinas	90

Summary for Contest, 1911.

Highest average score and first prize cup—N. Christensen, Laton, California, 93.58

Second highest average score and second prize cup—Victor Raciarini, Suisun, California, 93.33.

Third highest average score—Henry T. Hurst, University Farm, (not competing), 93.12.

Fourth highest average score and third prize cup—M. G. Johnson, Cottonwood City, 92.58.

Special Prize Cup—For improvements in methods and quality—Karel H. Mulder, Gustine, California, 92.30.

Certificates of Merit.

N. Christensen, Laton, Cal..... 93.58
Victor Baciarini, Suisun, Cal..... 93.33
Henry T. Hurst, Davis, Cal..... 93.12
M. G. Johnson, Cottonwood, Cal... 92.58

If there is sufficient interest shown in the work, it is planned to conduct another contest next year. Plans for this will be taken up later, and every buttermaker is welcome to offer any suggestions. The contest is for the buttermakers, and their support is what determines its success.

LIVESTOCK INSURANCE IN SWEDEN.

In Sweden, insurance of livestock is carried on by 46 societies extending their operations over the whole country, by 107 provincial and 552 cantonal or parochial societies.

The premiums paid yearly by the Swedish farmers for livestock insurance come to about 5 million francs, while the value of the cattle insured may be estimated at about 300 million frs. From an article on the subject in the August number of the Bulletin of Economic and Social Intelligence, published by the International Institute of Agriculture, we learn that, the largest number are insured in the "Scandinavian Livestock Insurance Society," with headquarters at Stockholm. In 1908, the amount of claims paid by this society was 1,636,184 frs., almost half of the total amount paid by all Swedish livestock societies.

In contrast with what is observed in several other countries, as, for example, France and Italy, where local mutual societies are most prominent, in Sweden it is the national insurance societies whose sphere of action is the whole kingdom, that insure the greater number of livestock. Suffice it to say that they insure 72 per cent of the horned cattle.

Two causes have specially contributed to the development of the large societies; the frequent fluctuations of mortality risks, the more dangerous for an insurance society in proportion as its sphere of action is more limited; and the increase in the capital value represented by the livestock, by which the risk is increased and becomes less easy for local societies to support.

In the article mentioned we find all the insurance conditions of the Swedish societies and detailed notices of the criteria the most important of them, the "Scandinavian Livestock Insurance Society," adopts in calculating premiums and settlement of claims.

This society has published interesting statistics of the mortality of the horses insured; for example, in the period 1891-1910, the average death rate of insured horses in Sweden was 2.38 per cent.

The data are grouped according to provinces, so as to show the influence of the various conditions of race, climate and agricultural labor. Thus, for example, in the province of Scania, where economic and meteorologic conditions resemble those of Denmark, the percentage of deaths is far above the general average for Sweden and nearly approaches that revealed by the Danish insurance societies (3.02 per cent).

Anderson, Shasta County, is shipping several cars of olives.

Profit in the Poultry Yard

Practical poultry people who may have ideas from their experience as to methods of feeding and housing and general care of poultry will confer a favor upon the Cultivator and its circle of readers by sending in concise accounts. Mrs. Basley is always willing to answer queries, which with the experience of others should make this a most valuable feature in poultry life on the Coast. Opinions or matters of a personal nature should be omitted, but a concise statement of facts is always valuable

A DEFENSE OF THE FANCIER.

By G. L. Hawley.

Being myself a poultry fancier, I feel a little sensitive about criticisms of the fancier. I write this defence in order to remove, so far as possible, some false ideas from the minds of some people.

It would almost seem to be the idea of some that the fanciers are deliberately breeding away from utility. I know this myself to be false. The fanciers cannot make money out of a bird that will not produce. Last year I bought three hens at five dollars apiece. One of them laid twenty-eight eggs in the month of March, has laid well ever since, and is laying at time of writing. All have proved good layers. In the selection of roosters that I have bought, the laying quality of the parentage has been one of the considerations in the selection of the birds.

Which pays best, a herd of ordinary cows in the dairy or a herd of pure bred milk stock? Oh, you say, the pure breds pay best. They have been bred for milk and butter production. Exactly. But is that outside of the fancier's realm? No, certainly it is not. Now we come down to a consideration of our poultry. What kind of a chicken does the utility man want? He wants a chicken that will lay, and more especially if he runs an egg farm exclusively. But how many utility poultrymen are in a position to breed satisfactorily for egg production? I dare say most are not. It is considerable expense for everyone to be fixed up for special breeding. Why not let the other man do it, and give him a reasonable profit Most people want a chicken of average size of its class, and the market poultryman must have size—a rapid growing, good meaty chicken. Who is fixed up to produce them? The fancier. Well, now, suppose, thrown in with all this, the chicken should actually be a hand some fowl, what harm would be done? None that I can see. Anyone knows that instinctively we take better care of a flock of birds that look well than if they do not.

Do not frown down the fancier, but insist that he produce a good utility bird.

INSTRUCTIONS IN POULTRY RAISING.

Do not undertake too much. The tendency to undertake too much is strong with the beginner. During the hatching season it seems as if there must be more room in the yards than the chicks will ever fill, and one is tempted to hatch a few more, and thus he gets out a large number of chicks. If he has good luck he soon gets his yards filled up with the little fellows, and as they grow there is no room for the increase in size. Then trouble begins. The yards become foul, the chicks crowd and bruise each other and the weaker ones give up and die. It is here where the beginner does wrong, becomes discouraged and neglects his chicks when he should be giving them the very best of care. The proper thing to do is to dispose of a part of the chicks, even if they must be nearly given away. Better do this than to try and keep them all and have them all get stunted and undeveloped. Be determined not to overstock the yards. The beginner should always keep in mind the fact that about half the chicks will be cockerels and plan accordingly.

If he has yard room for 100 mature fowls he should hatch about 250 chicks, as this number would give him 100 pullets, counting half for cockerels and some for loss and culls. The cockerels may be sold for broilers at a good price and help to buy feed for the pullets. Feed your pullets well and get them laying early. Feed animal food. Sometimes it is hard to get animal food for young chicks, and one is ofttimes likely to think it is not necessary to feed animal food to chicks, as their chicks eat heartily, seem all right and grow pretty well and don't seem to need it. Give these same chicks a little fresh ground meat scraps and bone and see how heartily they will eat it, and then watch them and note how much faster they grow and mature. Milk is a very good substitute for animal food. It can be soured and made into cottage cheese and salted a little. The little fellows will eat greedily of it. A little meat goes a long way, as a pound is enough for 30 full grown hens at one feed. half an ounce a day is enough for a full-grown hen. Feed your chicks regularly is one of the great secrets of success in poultry keeping. If hens are overfed one day and starved the next, they can not perform their duties properly and loss will follow the lack of system. Watch for mites, and do not forget that the little red mites multiply amazingly in summer.—The Feather.

SCRATCHING MATERIAL.

How many at this time of year stop to think how necessary it is to provide a supply of scratching material for the hens during the winter months? How few take advantage of the opportunities that are presented from now until snow comes of harvesting a supply.

There are in every community meadows and runs that can be cut for the asking or for a small sum. The hay, though it may be too poor to feed stock, is ideal for scratching purposes. It can be cut any time before the frost comes in the fall, cured and hauled to the poultry house where it can be stacked up until ready for use. It costs barely nothing except the time and labor expended in harvesting it: yet how few avail themselves of this chance of supplying one of the most important necessities to the successful poultry plant.

Oat straw is a more expensive litter, for it is valuable as a food for stock and commands a good price per ton in the market. Likewise, barley, wheat and rye straw are also valuable and are not often used in the scratching pens.

Corn fodder, leaves, stalks, husks make a litter that is durable and is not easily reduced to a powder. The butts may be removed after a time, for they will not readily work up into desirable litter.

Pine needles make a good material, especially for young pullets just commencing to scratch. They soon are reduced to a powder and need often to be replenished.

Leaves also are desirable and can be secured in the autumn and stored for the winter. They, too, are soon reduced in the scratching pen and a large quantity is required to keep up the desired supply.

Whatever is used for scratching material let us see to it that we harvest the supply in season. It will pay you in the end. A good supply of litter is the best investment a poultryman can have if he expects eggs from his flock during the winter season.—The Feather.

THE SETTING HEN AND HER EGGS

If the hen will come off the nest of her own accord for food and water and her dust-bath, and return to her eggs in proper time, it is the most desirable; but if she does not do so, she must be taken off each day for this purpose. It is not good for her to remain longer than one day on the nest. She should have food and water regularly in every twenty-four hours. Accumulations in her bowels should be avoided; for if this be permitted it will cause her to lose control and befoul her nest, causing much trouble, as if the eggs become soiled from this or any other cause it will necessitate cleaning them and the nest, which if not done will hinder the eggs from hatching well.

Of the perfection of his wonderful prose, Ruskin ceased to be proud. In middle age he wrote, "I have had what, in many respects, I boldly call the misfortune, to set my words somewhat prettily together, not without a foolish vanity in the poor knack I had in doing so, until I was heavily punished for this pride, by finding that many people thought of the words only and cared nothing for the meaning."

COULSON'S CHICK FOOD

COULSON'S EGG FOOD

Pillars of Strength
—IN—
Poultry Raising

Coulson's Chick Food is carefully prepared with due regard to the delicate mechanism of the little chick. It is rightly proportioned, properly ground and composed of properties upon which the little fellows can live and prosper. It will save your chicks and put them on the road to a commercial return for their owner. INSIST ON GETTING COULSON'S CHICK FOOD IF YOU WANT THE BEST.

Coulson's Egg Food is a most wonderful foundation for liberal egg production. It is not a stimulant. It is the egg itself. The hen transforms it into the egg of commerce. By feeding Coulson's Egg Food you simply give the elements from which she builds her eggs. Analysis will show this. SUCCESSFUL POULTRYMEN USE AND RECOMMEND COULSON'S EGG FOOD.

These foods are for sale by all reliable poultry supply houses

STANISLAUS POULTRY SHOW.

The first of what is to be the annual Stanislaus Poultry and Pet Stock Show was a decided success to the credit of its energetic promoters, and especially the able secretary, J. W. Guyler of Modesto. Many of the birds entered unexpectedly at the last, were not in first-class condition and showed lack of experience on part of owners but taken as a whole, the birds showed good breeding and intelligent selection.

There were also a good many exhibits from out of the county, especially Stockton and Lodi. The show was held in the big new garage on corner Ninth and H Street, a huge well-lighted room, an ideal place for the purpose.

J. D. Yates judged Mediterranean and American classes. Mr. Moore of Oakland, all others and pet stock, and all seemed satisfied with the scoring.

The merchants of the town responded generously with premiums for special prizes. Three hundred display coops were provided, the most of which were filled.

One of the largest displays was of Buff Leghorns and Buff Minorcas. The Black Minorcas were splendid. One trio of Blacks of unusual size and conformation, attracted as much attention as any one feature of the show. The competition was strong in R. I. Reds and Brown Leghorns. Blue Andalusians were in evidence and some good specimens. There was a solid display of Buff Cochin Bantams, a very attractive trio of Silver Braekels. Some very good White Leghorns, but display was small in comparison to average show. Some good Barred Rocks and White Wyandottes. The writer was particularly impressed with White Orpingtons and White Rocks. Guy Miller of Modesto had a fine display of the latter and showed ability as a poultry fancier as well as breeder of Jersey cows.

Some of the keenest competition was in the Indian Runner class, and there was a good display of Pekins, Rouens, Muscovys and Grey Toulouse geese. Some good bronze and white Holland turkeys were shown. A display of big Bourbon Reds attracted much attention. There was close competition in Belgian hares and pigeons.

Capons—First, Mrs. H. Carter; 2, C. C. Parks.

C. C. C.

C. C. C. for chickens is not a patent medicine, but a far more valuable asset in the raising of chickens than has ever been bottled or put in a package. I hold that it is the lazy among us who have to use the advertised cures for our stock, for in several years experience I've never known C. C. C. to fail to keep poultry perfectly well. Its only drawback is that it is no lazy person's perscription, for the letters stand for Care, Cleanliness and Common Sense.

A friend of mine fairly "butted into" the poultry business a year ago, beginning with a brood of seventeen day old Rhode Island Reds. Her knowledge of chicken culture was most limited, but she had a good equipment of common sense, and, having been trained as a nurse, her ideas of cleanliness and carefulness were highly developed. I was fortunate enough to be with her until the chicks were three weeks old, and what I learned from her was assuredly more than the information I gave her, and her success was so surely an outcome of her application of C. C. C. that I'd like to hand on what has proved valuable to me since.

The chicks were confined in a four foot square wire coop, which was made very simply of four panels 48x16 inches, the wood being 4x½ inch dressed pine, and the wire 1 inch mesh. The four panels were hooked together and the whole was covered with a 4x4 foot screen of 2 inch mesh wire. The advantages of this coop were its extreme lightness, airiness, and the ease with which it could be knocked down and packed away when not in use.

The chicks were given grit, shell, charcoal, water and dry wheat bran ad lib., but the rest of their diet was carefully doled out to them, and on the first appearance of any abnormal symptom a change was made. That's where care comes in. I know poultry raisers who will deliberately watch their flock sicken, day after day, when a little correction given at first is all that is necessary to check the disease. I've even heard them say, "I've some chicks with sore head that ought to have salve put on; I'll do it tomorrow." There is no "tomorrow" with a sickening chick if its owner is careful. What is to be done is done in the first place, and nine times out of ten the chick gets well.

In my friend's flock there was but one fatality. When they were nearly three weeks old one chick overate and died suddenly. After that more care was taken to prevent the chicks from eating "not wisely, but too well." They were fed a great variety—green food, rice, wheat, oatmeal, commercial chick food, fish, lean meat, and very little corn in any form. Once or twice they were given a little Jamaica ginger, and several times a pinch of Epsom salts in their water. The coop was moved every day, and all grain was fed in a litter. The coop was sprayed each week, and each chick was inspected for vermin occasionally. The coop was at all times almost as sanitary as a hospital room.

At three months old the cockerels were caponized, and one was lost through the severing of an artery. The operation was found to be simple if one used plenty of C. C. C., and the capons more than paid for the care and food of the flock raised to maturity.

Naturally such success encouraged the beginner, and she now has a yard of very profitable Reds, having bought pullets, and having raised dozens of youngsters hatched in incubators. She exercises the same care with her many as with the first few, and is rewarded in proportion, and I, who watched her methods, have adopted them and am vigilant in the use of C. C. C.—Poultry.

WHEN HENS DO BEST.

One of the most practical egg farmers at Colorado Springs prefers to have 20 hens in each pen 12x16. The connecting yards are 16 by 80 feet. A number of times he has tried more than 20 hens in a pen of this size, but each time lost money by doing so on account of reduced egg production. With 20 hens in each pen he gets from 80 to 95 per cent in egg yield. He frequently gets 20 eggs in a single day from 20 hens or pullets. It is the rule to gather 16, 17 and 18 eggs from each pen of 20 hens during the laying season. He has tried as many as 75 hens in a pen, but in that case could get no more than 60 to 70 per cent of eggs, despite his best efforts in care and feeding. A number of times he tried the experiment of turning the layers out into an alfalfa lot, thinking that perhaps the large range and the green food in its natural state would benefit them and cause them to lay more eggs, but just the reverse seemed to be true. When having the run of the alfalfa they averaged five or six eggs less a day. He is satisfied that his hens do best when kept in their runs and fed regularly the right kind of foods, including green food, grit, shells, etc. In other words, fowls are creatures of habit and after they get settled down to a certain daily routine they will do better under proper conditions than if allowed to run at large or do something different.—Field and Farm.

ADDITIONAL STOCKTON WINNINGS.

Your valuable paper, the California Cultivator, just received. See the account of Stockton Show, with prize list of all varieties except French class. Why has that been left out? It had twenty-four birds in line, and some very fine specimens in it, Mrs. Emma F. Reid's celebrated "Teddy" winning first. She also won in full, cock first and second, hen second, cockerel first and second, pullet first and second, pen first and second, silver cup for best display. Mr. Richards won hen first and second, cock third.—Emma F. Reid.

SAN DIEGO SHOW.

The Fanciers Club of San Diego's forthcoming Poultry Show, January 12 to 18, will be the largest and best ever held in San Diego. Handsome ribbons with cards attached giving variety and awards and many special premiums are being offered. The judges are Geo. P. Meyer of Encanto, Geo. W. Masterson of Duarte and E. C. Emerson of Los Angeles.

Lee's Egg Maker

Are your hens laying *now?* If not, are you doing your part in furnishing proper feed. Protein—*digestible* protein—is the feeding secret. It's a simple matter to get food rich in protein, but the percentage of it that is *digestible* is the thing to consider. Lee's Egg Maker is almost a pure meat product, clean, sweet, and wholesome, and contains more protein in *digestible* form than any other meat product. Successfully replaces all other kinds of meat food at *less* feeding cost and better results. That's our *guarantee.*

Prices 25c to $7.00, according to size.

GERMOZONE

is the best health-insurance you can furnish your fowls. Indispensable as a remedy for *Roup, Colds, Chicken-Pox,* and other poultry ailments. Disease in your flock now will probably mean diseased birds all winter and poor breeders in the spring. Germozone twice-a-week tones and builds up the system, destroys disease germs, insures better and healthier stock *now* and strong, vigorous birds for the breeding season. Best guarantee *against* disease; surest remedy if disease has already taken hold. *Either tablet or liquid. Price 50c.*

Lee's goods are on sale in almost *every* town, but if yours is an exception send your order direct to us and ask for our *free* offer.

GEO. H. LEE CO.,
225 W. 2d St., Los Angeles, Cal.

Send for your *free* copy of Lee's New Poultry Book. Interesting; instructive. The "best yet."

LIVE STOCK

POLAND CHINAS.
REAL BIG, SMOOTH TYPE.
Sows and gilts bred to "Greenbacks," the great Ohio boar. Gilts sired by "Greenbacks" old enough to breed. Gilts sired by "Meddler Keep," the great Missouri boar, who was sired by "Master Meddler," said to be the greatest Poland China boar living. Serviceable young boars sired by "Greenbacks" and "Meddler Keep," and whose dams, "My Peerless Illinois Sows," are among the cream of the breed. Prices very reasonable.
GEO. A. SMITH, Corcoran, Cal.

We have now five choice young registered Holstein bulls for sale. Handsome fellows. Stock of our breeding won at the fairs all over the state. Juliana De Kol was champion at Sacramento. Most of these bulls are either sired by her brother or are out of her sisters. M. E. Sherman, Minnewawa Stock Farm, Fresno, Cal.

Grapewild Farm Herd of thoroughbred Berkshires. State fair prize winners. Boars and sows of all ages, unrelated. Address A. B. Humphrey, Mayhews, Sacramento Co., Cal.

For Sale—Poland China pigs, 4 to 6 months old. Nice lot, either sex. Guaranteed as represented; at farmers' prices. Start right. W. A. Young, Lodi, Cal.

For Sale—Your choice of two registered Jersey bull calves, dropped about Nov. 1st. Both of these are from unusually fine stock. Price $50 each. I will ship at once or feed them for a few months for you. T. E. Wilson, Ceres, Cal.

For Sale—Ten head Shorthorn bulls and Berkshire hogs from best strains in America. I won silver cup for best herd at California State Fair, 1911. H. L. Murphy, Perkins, Cal.

Three Holstein Friesian Bulls, splendid young animals, for sale. Well marked and subject to registry. Write at once to Geo. C. Roeding, Fresno, Cal.

Belgian Hares—Fine, healthy breeding stock, for sale cheap. Write for your wants and prices. J. A. Reinhart, Hollister, Cal.

Pure Toggenburg Buck, a bargain. H. W. Shepard, Paradise Valley, National City, Cal.

Berkshire Pigs, all ages and both sexes, for sale. B. de Groot, Aptos, Cal.

WANTED

Local Representative Wanted—Splendid income assured right man to act as our representative after learning our business thoroughly by mail. Former experience unnecessary. All we require is honesty, ability, ambition and willingness to learn a lucrative business. No soliciting or traveling. This is an exceptional opportunity for a man in your section to get into a big paying business without capital and become independent for life. Write at once for full particulars. Address E. R. Marden, Pres. The National Co-Operative Real Estate Company, L 448, Marden Building, Washington, D. C.

Wanted—Position as working foreman or under-foreman on ranch, by married man. Perfect health. Salary no object. R. C. Batchelder, 2360 Thompson St., Los Angeles.

Established 1892 112-118 South Los Angeles Street, Los Angeles.

FARM LANDS FOR SALE.

For Sale—
A FINE COUNTRY HOME.
75 acres—20 acres alfalfa land, some alfalfa planted, all under cultivation. Good six-room house, big barn, 24x50, with stable full length on each side; windmill and tank. Water piped to house and barn and chicken corrals. Lots of shade and flowers; 8 acres vineyard; picked 24 tons grapes this season. Large well and gas engine for irrigation, 5 H.P. This alone is worth the price asked, but the owner will for a short time throw in 4 work horses and harness, 2 cows, 1 heifer, 250 chickens, 1 heavy wagon, 1 light wagon, 1 covered buggy, plows, harrows, and, in fact, all farming tools. Hay enough to carry stock through till harvest; 25 bushels corn and 25 bushels wheat, and other things too numerous to mention. Family orchard on the place. Only $8000; ½ cash, balance to suit. This is an income from the start. F. J. Conrad, The Hustler, Escondido.

WILL YOU BUY A HOME
In one of the best colony districts of the State? We have sold many 20-acre tracts in the last three weeks to people who have inspected the land, and they pronounce the land first class and the conditions ideal.
There is plenty of water, creamery, cannery, churches, schools and packing houses.
Close to 4 Railroad Stations.
We want the right people and will make terms to suit, and, if desired, will accept part of crop each year after first cash payment until land is entirely paid for.
ORCHARD AND FARM LANDS COMPANY, 309-310 Stimson Bldg., Los Angeles.

For Sale—LINDSAY ORANGE LANDS.
Eleven days before Christmas the fourteen packing houses of Lindsay sent out pay checks for the 1910 navel orange crop. Lindsay orange district had the holiday orange market all to themselves, and of course they sold at good profit.
Why not invest in some of this Lindsay orange land and get the benefit of rapidly advancing prices?
Ten-acre tracts in Lindsay, $150 per acre, on easy terms.
Choice Tulare alfalfa lands, water in abundance; any size tracts, $50 per acre up.
KIOUS-WHANN REALTY CO.,
235 Mason Bldg., Los Angeles. A4164.

$17.00 Per Acre——880 Acres.
880 acres A-1 citrus, grain or stock ranch, 8 miles south of Escondido, in line of new electric road now building; ½ mile from boulevard. Five-room house, barn, sheds, etc.; good well. Creek runs through place; 700 acres can be cultivated. This ranch is just across the road from land selling at $75 to $150 per acre. This is a bargain. Charles Soults, Escondido, San Diego County, California.

170 Acres—¼ mile from R.R. station and school, $30 per acre. 100 acres in crop; more can be planted to trees or vines. Partly warm citrus soil or for winter gardening; some alfalfa land; well 50 feet deep, 10 feet across, water 8 feet from surface; all under fence; no other improvements. Terms $3000 cash, balance at 7 per cent; will not trade. Address C. F. Haney, Escondido, Cal.

Choice Orange Land, Exeter District—63 acres, 3 miles south of the town of Exeter, California, three-quarters of a mile from Southern Pacific railroad station, right in the foothills, leveled, water developed on it. Write for particulars. The Phalanx Company, 513 Chamber of Commerce, Los Angeles, Cal.

For Sale—
THE ORANGE GROVE MAN.
Large list of orange groves in best districts. Seven years' experience in growing oranges.
A. W. RICHARDS,
THE ORANGE GROVE MAN,

IS CIRCULAR SILO PATENTED?

The Iowa Agricultural Experiment Station has set out on a nation wide hunt for a home made round silo built in 1898 or earlier and incorporating some of the esesntial features of the patented structure of today. H. L. King, agricultural engineering experimentalist of the station, has offered a reward of $50 for the first definite information about just such a silo. He expects also to make a trip to several of the older dairying districts of the United States for a personal search for pioneer silos.

Back of this unusual hunt is the claim of the wooden silo manufacturers that American farmers cannot build round silos of any type or material without first paying tribute to them in license fees. They claim a patent monopoly, and they have organized themselves to enforce it. In the past summer of extensive silo building they sent out thousands of letters warning farmers who were putting up home made silos and threatening suit for infringement.

This claim of a silo monopoly concerns the Iowa station, because two of its experimenters, Prof. J. B. Davidson and M. L. King, designed a successful hollow tile silo three years ago, which they dedicated to the American farmer and his free use. This silo has been made the special object of attack in Iowa, where nearly a thousand are in use. Letters warning farmers building these silos have been sent out, and intimations of damage suits have been frequent. Whenever appealed to, the station has made the positive statement, based on investigation, that neither brick, tile nor masonry silos in any way infringe upon wooden silo patents. After further investigation the station has taken the new stand that it is doubtful if the manufacturers really have a monopoly, as they claim, on wooden silo building.

"We have good reason to believe," says Mr. King, "that the special features of wooden silos for which patents are claimed were used in some of the silos built prior to the date of the patents, June, 1899. Those features are the continuous door, reinforced door jambs, door jamb braces and devices for holding the doors in place. Round wooden silos were in use long before 1899. We want additional information about them. For the first information received about such a silo containing some of these mentioned features $50 will be paid if it is sent to the Iowa Agricultural Experiment Station, Ames, Ia.

"The Iowa station is not setting out to fight anybody. It merely wants to make certain about these disputed points and to protect the farmers in Iowa and in every state in what it considers their right to build round silos of brick, tile or masonry, and possibly of wood also."

Kerman's first annual chrysanthemum show called out large attendance.

SHOULDER GALLS AND ABSCESSES.

The causes of shoulder galls and abscesses are ill-fitting and dirty collars, also horses unaccustomed to work are put at hard, continuous pulling before the shoulders become toughened. The first symptom of a sore shoulder is that the hair stands erect in the location of the injury. Later, if the animal is continued at work with the same kind of collar, the skin and hair slough, leaving a raw, bleeding surface. The size of the sore may be from that of a silver dollar up to three inches in diameter.

The sore shoulder causes the horse considerable pain, and if not relieved the animal soon loses flesh, and may cause a sound animal to become balky.

Many times a soft swelling appears just above the point of the shoulder. If opened at the outset a straw-colored liquid escapes. On the other hand if not molested it becomes infected and an abscess forms.

These abscesses are often superficial, but may be deeply seated and require expert attention. The deep abscesses may be located six inches or more below the surface of the skin, between the shoulder joint and the chest wall. These abscesses often prove serious and should only be treated by a qualified veterinarian.

By way of prevention of shoulder abscesses and galls, give particular attention to the collar. See that it fits snugly at the top and only room enough between the neck and collar to admit the arm. Also remember that the collar should be kept clean. Wash the dried sweat off the collar at night, and bathe the shoulders with cold water after the horse is unharnessed.—C. L. Barnes, Colorado Ag. College.

FOOD VALUE OF WALNUTS.

State Statistician Geo. Robertson sends us the following extract from the London Lancet:

"The food value of walnuts is very high; they are very rich in fat, containing as much as 63 per cent, while the proteins amount to nearly 16 per cent. It has been calculated that 30 large walnut kernels contain as much fat as 2¾ pounds of lean beef, and yet the walnut is used as a supplement to a square meal. In the combination, therefore, we have all the elements which make for a complete diet, viz., fat, protein, carbohydrate, to which may be added mineral salts."

FIRST ROADS.

The first road built by white men in the United States was at Jamestown, Virginia, and the first law passed by the General Assembly in 1632, read as follows:

"Highways shall be laid out in such convenient places as are requisite, according as the governor or commissioners shall appoint, or as parishioners of every parish shall agree."

The oldest New England road was "Coast Path," which joined Boston and Plymouth. It was established by the general court in 1639 and in 1653 the Massachusetts commissioners established "Kennebunk Road by the Sea," as a "highway between towns for horse and foot."

Over on the other side of the world in the tropical possessions, the Philippine Islands, the United States government is building good roads at a rate that would surprise the most enthusiastic road booster. Why not at home?—Better Roads.

Midland, Texas, will hold a big irrigation well celebration next week on account of the discovery of a strata of underground water in such quantity that one well is furnishing 2000 gallons per minute, and that at a depth of only 120 feet.

VALUABLE LANDS.

The story of Patterson makes good reading, for it is an epitome of the story of California. Patterson has grown as California has grown—amazingly. And with its growth have come new wealth, artistic beauty and contented people who live on the land, by the land and for the land. Not two blades of grass but twenty have been made to grow where one grew before. Intensive and intelligent cultivation is working the same wonders at Patterson that it has worked elsewhere in California and is playing its part, the leading part, in the making over of Patterson into one of the garden spots of the world.

While the Patterson lands are being developed along the most diversified lines, it is notable that the growing of English walnuts, at present a most important industry confined almost solely to Southern California, promises to become the most attractive business at Patterson. It has been thoroughly demonstrated that the English walnut, when grown on the root of the native black walnut, thrives amazingly at Patterson. The trees make a splendid growth, even more rapid than in Southern California, and come into bearing early. The Franquette and Mayette are the varieties that are being planted, practically to the exclusion of all others. A combination of alfalfa and walnuts is a great favorite with the Patterson settlers, on the theory that the alfalfa will keep up the payments and pay for the property while the walnuts are reaching the full bearing period. No one who knows much about California needs to be told of the sure and certain profits in walnuts. That industry is well established as one of the foremost in California. And alfalfa ranks equally high. It is the greatest mortgage lifter in the world. Combine the two, as they are doing at Patterson, and you have a team that ought to pull any man to prosperity. Watch Patterson's walnut orchards and in a few years you'll see a new star in the walnut firmament.

CHAS. S. WAKEFIELD, - - - Petaluma, Calif.

Part of Trinidad Asphalt Lake

It costs no more to lay Genasco than it costs to lay ordinary ready roofing which soon cracks, breaks, and leaks.

Genasco

the Trinidad-Lake-Asphalt Roofing

is a permanent waterproofer.

Unlike roofings made of coal-tar or manufactured so-called asphalts, whose oils rapidly evaporate on exposure to sun and air, the *natural* oils of the *natural* asphalt stay in Genasco and keep it full of the life that resists all atmospheric conditions and changes.

This prevents repairs, renewals, and added time and labor cost; and that means real economy.

The **Kant-leak Kleet** adds to the life of roofing seams. Makes them absolutely watertight; prevents nail-leaks.

Ask your dealer for Genasco with Kant-leak Kleets packed in the roll. Write for samples and the Good Roof Guide Book.

NATIONAL QUARANTINE.

(Continued from Page 547.)

A recent issue of the Pacific Fruit World reports that Mexican oranges are being shipped into New Orleans. The first consignment of the season, consisting of 1500 boxes, was expected to reach New Orleans about the middle of September. It is not stated from what section of Mexico this fruit was shipped, but it is not very likely that it came from a section which is located very far from the districts known to be infested with the orange maggot—in fact, it is more than likely that this Mexican fruit came from a point where the pest exists.

A national quarantine and inspection law is sadly needed. All Mexican oranges should be prohibited from entering this country, at least through a port situated, as is New Orleans, in the midst of a citrus fruit growing district. The United States Department of Agriculture and the entomologists of the United States, through the Association of Economic Entomologists, have for years striven to have Congress enact a national law for the purpose of protecting against the importation of pests. Certain nursery interests, however, have opposed such a law so strongly as to have prevented, up to this time, all legislation of this kind.

The secretary of the United States Department of Agriculture should have authority with the advice of his bureau chiefs to regulate the importation into this country of fruits and vegetables, as well as nursery stock, and also to regulate the interstate shipments of fruits, vegetables and nursery stock when necessary for the protection of farmers and fruit growers. In Arizona we are especially interested in the prevention of the establishment in this country of the Mexican orange maggot, the melon fly and the Mediterranean fruit fly. It is true that other parts of the country are more directly menaced by these pests than is Arizona, but if once established they will eventually reach our farming districts in spite of our comparative isolation.

Many other foreign pests might be mentioned, but these three which have been considered are of sufficient importance to justify our taking a live interest in the matter of a national quarantine and inspection law. This is an issue which our candidates for the national house of representatives and the senate should consider, and our fruit growers' associations and farmers' organizations should bring the importance of this matter to the attention of these candidates. It is not a political question in any sense, but a matter of doing our part in securing legislation which is first of all for the welfare of the nation at large, and second, for the protection of our local farming industry.

The United States is being made a dumping ground for European refuse nursery and ornamental stock and our farmers and fruit growers are menaced by the importation of fruit and vegetables infected by insect pests and diseases which are capable of doing incalculable damage. Practically all European powers, Canada and other important British possessions have protective legislation which in most cases absolutely prohibits the importation of American nursery stock and admits our fruits only after rigid inspection shows freedom from insect infestation.

The text of the bill now before congress providing for a national law to prevent the importation of insect infested or diseased plants is contained in a circular (No. 37) recently issued from the office of the secretary of the U. S. Department of Agriculture. Let us not only hope, but insist that those who officially represent the new state of Arizona at the national capitol support this bill for the benefit of not only the producer of farm products, but for the consumer who pays his share of taxes levied by insect pests.

CATCHING COLD.

Coryza is an inflammation of the mucous membrane lining the cavities of the nasal passages, and may be either of the acute or chronic variety. In its acute form it is generally called "a cold in the head." The reason for this is that, given certain conditions of the system which tend to inflamed mucous membrane, the acute attack can very often be traced to exposure to cold, drafts or damp. It can, perhaps, just as often be traced to heat, dust and stuffiness; but, whatever may be the final touch, it is certain that the victim of the coryza was in a condition in which his powers of resistance were reduced, or he could not have "caught cold."

It is of great importance that those people who spend many months of the year traveling from one attack of coryza to another should learn just where to place the blame for their trouble. It is a pity to get into the habit of blaming every open door or window, or dreading every unexpected breath of air, because this only leads to the course of life most to be avoided. If a person finds himself with the "catching cold" habit increasing winter by winter, depend upon it there is something wrong, and that something is not fresh air, because that is the very thing he, of all people, most needs. In such a case the daily habits should be carefully overhauled.

Does the sufferer overeat, and especially does he take too much animal food and too little exercise? This mistake is at the root of the coryza habit in many cases. It is simply the sign of rebellion on the part of the overloaded system. Often the trouble may be traced to too much heavy clothing, to rooms kept too warm, and to an atmosphere dried up with steam and no ventilation. People who sleep in shut-up, stuffy bedrooms ought to live in a state of grateful surprise if they do not have constant colds.

The change that can be produced in the human constitution in this respect by a continuous course of common sense applied to daily life is almost like miracle working. But the course must be begun today and kept up at least three hundred and sixty-five days in the year. The cold catcher must pay minute attention to the digestive process, and is probably better off to eat meat not more than once a day at the most. His bedroom window must stay open winter and summer—not two inches, but all the way open. He must accustom himself to cold water bathing. This does not necessarily mean ice water bathing. A bath thermometer is a cheap purchase, and sixty-five degrees is cold enough for most persons.

Deep, slow breathing, with the mouth closed, should be constantly practiced, and never more faithfully than at the moment when a cold seems to be in the act of getting itself "caught."—Youth's Companion.

The harvesting of the crop of the Stanford Vineyard at Vina, Tehama County, required 20 men and 50 teams. This vineyard was planted over fifty years ago.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper, and sign full name and address. Unsigned communications receive no attention.

Buffalo Bugs.

I send specimens of bugs or worms which were in a trunk where there was nothing apparently to attract them; also found them near flour bin and around edges of pantry shelves.—Subscriber, Monrovia.

These were submitted to Mr. E. O. Essig, secretary of the State Horticultural Commission, who writes:

"This same insect came to me at Santa Paula. It is one of the carpet beetles of the genus Anthrenus, and is what is commonly known as the buffalo moth. It is not surprising to find it among clothing in trunks, as it is a common clothes feeder, and also works on carpets, and in fact any of such materials. A good way to rid a house of this pest is to give it a strong fumigation with hydrocyanic acid gas."

This pest is one of the most perplexing the housewife has to deal with. It will destroy any woolen cloth. We do not know whether moth balls will affect them or not, but the inquirer should take steps at once to destroy them by the method Mr. Essig prescribes.

Dynamite for Subsoiling.

We have read with interest your article on removing of hardpan with dynamite; also have the booklet issued by the Du Pont people, but in neither do we find anything regarding its use in destroying plowsole or so called hardpan in orange groves. Last spring I tried running a subsoil plow through the middle, going both ways, in the orchard, but see little, if any, beneficial results. My plow was 18 inches from point to beam. From this you will see that I could not go very deep.—Subscriber, Bloomington.

We believe the use of dynamite will not be necessary in such a case. We also believe that fall subsoiling is much to be preferred. If this orchard were ours, we would run the ordinary 12 inch plow as deep as possible, then put the subsoiler in the bottom of the furrow. If this is done in the fall, when the subsoil is dry and hard, it would result in shattering and breaking up a material area of it. In the spring, after the heavy rains, there is practically no plowsole, and even if there were, it would be so softened that subsoiling would not have the breaking up effect which it would when it is dry and hard. We grant it will take a powerful team to do it at this time of the year. The trouble with dynamite in this class of hardpan is that the effect would be for only one season.

Defective Walnut Shells.

I send walnuts with perforated shells or shells so very thin that the least pressure breaks them through. There is apparently a deficiency in shell making material. The trouble is confined to some ten or twelve trees in my orchard. The trees are large, about 18 years old and seedlings, vigorous and very healthy looking. Hulls were all right, same as in the perfect nuts. This has appeared to a limited extent in these trees before, but this year it is worse.—Subscriber, San Jose.

Dr. J. Eliot Coit answers: "Walnuts the shells of which are malformed, leaving in many cases openings exposing plump, well filled meats, are known by walnut men as "perforated" walnuts. It seems to be a physiological disease due to some obscure derangement of nutrition. Appears to be worse on young trees than old. Cause has never been ascertained. It has been suggested that the walnut aphis which occurs in such large numbers some years is either partly or wholly responsible for this trouble."

Legal

Edw. L. Payne, attorney, 301-304 Douglas Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ N Broadway, Los Angeles.

Tresspassing Stock.

Would like information as to the present status of the law regarding trespassing stock. Must land be fenced in order to secure recompense for damage done? What is the law as to estrays?—Subscriber, K. M. H., Santa Ynez.

See article by Mr. Payne in stock department of last week.

IRRIGATION RESOURCES OF CALIFORNIA.

The mapping of the irrigable agricultural areas of California and the preparation of a report showing the present and possible future irrigation development in the state is the task turned over to the irrigation investigations of the United States Department of Agriculture by the State Conservation Commission of California, of which former Governor Pardee is chairman, and Francis Cuttle and J. P. Baumgartner are the other members.

Ten thousand dollars has been set aside by the Conservation Commission for this work under co-operative agreement with the Director of the Office of Experiment Stations and the Secretary of Agriculture. According to this agreement, not only is the Department of Agriculture conducting the investigation and supplying part of the immediate funds needed, but it is also placing at the disposal of the Conservation Commission for the purpose of this report the results of the irrigation census in California recently completed at a large cost under co-operative agreement between the Department of Agriculture and the Bureau of the Census. All of the data gathered in California along irrigation lines during the past eleven years under authority of the Secretary of Agriculture and in co-operation with the State of California will also be drawn upon.

While the irrigation map being made is not to be based on precise surveys made during the present year, it will follow careful field investigations into the irrigable agricultural areas of every valley of any importance in the state. The map will be prepared on a large scale, and will show the irrigable agricultural areas in every part of the state where irrigation is or should be practiced. It will also show the irrigated areas, the water resources of importance in irrigation, and all of the co-operative and company canals.

The field work of this investigation has already begun, and the northeastern counties of the state are covered. From eight to ten men will be engaged on the investigation throughout the winter, and it is expected that it will be completed by April. In the meantime progress reports will be issued stating the conditions found, and before the next meeting of the legislature it is expected that a bulletin carrying the results of the entire inquiry will be issued by the Department of Agriculture at Washington. The work is being directed from the California headquarters of Irrigation Investigations, at Berkeley.

STRYCHNINE POISONING IN DOGS.

When the house dog comes home, acting very strangely and frothy saliva driveling from the mouth, there are a number of things to be considered. Most people think first of rabies and secondly of poisoning. Since both are very common the general public should be enlightened in regard to them.

Rabies can not be easily diagnosed, but strychnine poisoning should be readily recognized by anyone.

The first symptoms of strychnine poisoning appear in from fifteen to sixty minutes after the drug has been administered, if it is carefully hidden in a large piece of meat it may be an hour or more before any symptoms appear.

At first the animal acts extremely nervous, it cannot stand still and constantly lifts its feet as if the floor were hot. Rapidly the muscles become stiff and the dog assumes a position resembling a saw buck, next spasms appear and last for a few seconds, then the muscles will partially relax and the animal will be able to breathe more freely.

Spasms will recur more and more frequently until death results.

What can the owner do for the patient until the doctor arrives? In the first place, do not waste valuable time trying home remedies before calling professional aid. Minutes are precious in cases of strychnine poisoning.

Lard, cream and all such agents are absolutely of no value and the animal is only annoyed by attempts to administer them. The only household remedy that can be of value is mustard, and it is ordinarily too slow in action to accomplish any good. A teaspoonful in a cup of water may be given by means of a tablespoon. Other remedies are useless and are consequently worse than nothing. The doctor can produce vomiting in less than fifteen minutes or wash out the entire intestinal tract.

There is no danger of the animal biting and absolute quiet is good treatment.—H. E. Kingman, Colorado Agri. College.

Now that a shake-up has occurred in the state printing office and presumably an honest administration of affairs will obtain, we would like to see the system of state text book production continued for a short time. That there has been graft in the past goes without saying; the books have been offered at a price even equal to that asked by the book trust. Youngsters of this state should be supplied with school books at a much lower price than during the past few years. It is indeed unfortunate that the system of graft in this country should fasten itself upon the education of our youth. It is self-evident that we must have new and up-to-date books to place before our children, but the chronic change of books each term or at least each year has placed a useless and heavy burden on all parents.

HIS CONSOLATION.

Nebuchadnezzar was dining on all-fours.

"Anyway," he observed, "I'm more comfortable than that picnic party."

Thus we see there's nothing so bad that it might not be worse.—Harper's Bazar.

Household Department

THE OLD GRAY TURKEY'S NEST.

Adown a green lane shaded by spreading apple trees,
Near where the young corn murmured uncertain melodies,
A lithe and agile figure, all clad in feathered gray,
With high and halting footsteps pursued its devious way.
Cool lay the morning dewdrops on every blade of grass;
The sweet June winds blew over, then turned to softly pass;
And all the nameless odors of Araby the Blest,
Lured on and on the seeker for the old gray turkey's nest.

Beyond, a fragrant jungle abloom with nodding peas,
Where butterflies swayed lightly to the trombones of the bees.
Where slid, with wary motions, and with suspicious eyes,
A small head, weirdly snake-like, in a perfumed paradise.
The cherry-bird chirred shrilly amid the crimson fruit,
The bobolink—derisive—urged on the sly pursuit,
And, skulking in the thicket, the partridge joined the quest;
All subtly knew the seeker for the old gray turkey's nest.

'Mid gently tossing wheat waves, there cleft its sinuous way,
A curving neck, and over there sailed a dash of spray:
With plumy breast and pinions a swan the cloudlets grew—
A gray swan in the green sea, a white swan in the blue.
And then through tags of sweet fern a shadow held its way,
With flakes of light bemottled, all swift and lithe and gray;
Behind, a larger shadow with naked small feet pressed,
With eager blue eyes seeking the old gray turkey's nest.

A pause, a questing "quit, quit," a running swift as thought,
Then silence, and the quick eyes fixed on the spot they sought.
And nearer yet, and nearer—the dry leaves eddy round,
A sudden flash and scuttle—the treasure rare is found.
The small heart swells with triumph, and inly shouts and sings,
Till joins in exultations the subtle soul of things.
Oh, once to know the rapture, the triumph of the quest,
Again to follow, follow, to the old gray turkey's nest.—Exchange.

DIGESTION AND HEALTH.

The scientific physician of experience will observe patiently and confidently the patient's need for nutrition, as unmistakably shown by weakness and loss of weight. It is good treatment to offer what is delicate, light food to a sick person. Nothing is ever lost by encouraging the return of real hunger, and everything is gained for the good of the patient, says "Medical Review."

Let not your fear of complications, or your theories of fasting or waste of patient's strength cause any neglect of the foregoing rules in the scientific treatment of the unfortunate sick. The hunger signal will appear in due time, but if it should not come, it shows that the case is hopelessly fatal: in such cases it would be wholly useless to force food.

The alimentary canal is the root of life. The weight of the body depends upon the amount of food that it can prepare and absorb, while strength and bodily comfort depend upon so much as is perfectly converted and assimilated. Perfect digestion depends upon health of the vital organs, and in turn perfect health of the vital organs depends upon a perfect digestion.

It is seen by this interdependence between vital parts and digestion, that continuous health depends upon an even balance of forces acting in harmony. If the food is proper and digestion perfect, nature has a fair chance to show itself in the beauty of health.

Mental and physical wrecks and human beings with added sorrows, are directly traceable to mistakes, which start at the mouth. It seems strange that man's food, his best ally, can at the same time be his greatest danger.

Temptations of the table and sideboard appear hard to resist, habit is strong and holds on with a tight grip. Children are misfed as a rule from the beginning, thus creating a bad tendency before the infant leaves the nurse. As a growing child the dangerous habit of gorging candy and stimulating food is unchecked, child sickness and disease are thus produced, and in no other way, save in rare cases.

Children have many narrow escapes from death, but reserve vitality carries some of them to mature years, even though affected with disorders and disease all along the way. In spite of daily and oft repeated errors, children manage to live and grow, but many are stunted and deformed by the time the growth is finished.

SCOTCH HUMOR.

If any of my readers are still in doubt as to the exact connotation of the adjective "pawky," or question its entire applicability to the humor of Scotland, I think the following little tale will clear the matter up. At a funeral in Glasgow a stranger had taken his seat in one of the mourning carriages, clad in decent black. His presence excited the curiosity of the other three occupants, one of whom presently could stand it no longer, and thus addressed him:

"Ye'll be a brither o' the corp?"

"No!" replied the gloomy stranger: "I'm no brither o' the corp!"

"Weel, then," pursued the curious mourner; "ye'll be his cousin?"

"No, I'm no that!" was the still tantalizing reply.

"No?" went on the insatiate querent; "then ye'll be a freend o' the corp?"

"No that either!" admitted the stranger. "To tell the truth, I'v no been that weel mysel', and as my doctor has ordered me some carriage exercise, I thocht this wad be the cheapest way to tak' it!"—Charles Johnston, in Harper's Weekly.

ANTIDOTE FOR "TOADSTOOL" POISONING.

Dr. Murril is reported as stating that there is no antidote known for "toadstool" or amanita poisoning. Gibson, in his book, makes mention of sulphate of atropin, which, injected hypodermically in repeated doses of one-ninetieth of a grain, is said to be extremely efficacious.

When all fungus gatherers learn to discard such foolish tests as boiling with a silver spoon? If they look for the bulb or poison cup at the root and the frill on the stalk and find them lacking it is safe to say they can eat any pleasant-smelling fungus without serious inconvenience — even russala emetica, provided that it be cooked. At least they will not encounter the hideous risks attendant on an entanglement with the amanitas.—New York Times.

MEXICAN LAND

EVERY DAY BRINGS THE PANAMA CANAL NEARER TO COMPLETION.

WHAT ARE YOU DOING TO REAP A PROFIT?

ARE YOU MAKING AN INVESTMENT WHERE YOUR $$$ WILL EARN MORE $$$$$$$$ EVEN BEFORE THE CANAL IS COMPLETED?

THE WEST COAST OF MEXICO WILL BE BENEFITED MORE BY THE CANAL THAN ANY OTHER SECTION.

NOW THE QUESTION IS:

WHAT PART WILL ADVANCE THE QUICKEST?

ANSWER: THAT PART WHICH HAS THE MOST NATURAL ADVANTAGES AND A CLIMATE SUITABLE FOR AMERICAN SETTLERS.

THE CULIACAN VALLEY is just below the frost line, yet far enough north to avoid the disagreeable tropical features.

Ample rainfall for one crop and some years two.

Abundant water for irrigation when necessary.

A larger variety of products than any other section of the continent.

Markets for everything.

Excellent transportation facilities.

Cheap and efficient labor.

In the Culiacan Valley the American Farmer can raise the products he understands best and turn a portion of his land into a money making tropical garden.

The soils are deep and rich; no fertilization necessary for fifty years.

FARM LANDS AT $10.00 TO $25.00 AN ACRE ARE SELLING FAR BELOW THEIR INTRINSIC VALUE.

Fibre and range land at lower prices still.

THERE IS A FORTUNE FOR YOU IN SINALOA IF YOU SELECT YOUR LAND WITH DUE REGARD TO SOIL AND LOCATION.

A PLEASANT, HAPPY LIFE WHILE MAKING THE FORTUNE.

If you are interested in bettering your condition or investing where the largest returns compatible with safety are to be had, our literature will interest you.

DON'T DELAY. PUT IT OFF, OR FORGET IT.

WRITE TODAY.

BEN. W. McCLOSKEY & CO.

Mexican Lands Exclusively **305-306 Union Trust Building**

FOR SALE

Registered Jersey cows, heifers and heifer calves and two bull calves. The young things are sired by Brown Lassie's Advocate 80.045. He is grandson of Diploma's Brown Lassie and a descendant of Brown Bessie, Merry Maiden, Ida Marigold and others of noted merit. The heifers should duplicate the work of their ancestors, being out of high testing dams.

Also a few choice Berkshires of both sexes. Write for prices and breeding; or, better come and see them.

THE R. F. D.

By Amos R. Wells.

Of all the works of Uncle Sam,
Beneficent and wise—
The mighty irrigation dam,
The conquest of the skies,
The money coined sound and true,
The seeds he scatters free—
There's none that holds a candle to
The R. F. D.!

The R. F. D., with lengthened arms,
Extends its kindly sway
To little isolated farms
From cities far away.
Through country lanes it reaches out,
Beyond the upland lea;
And ah, its travel-feet are stout—
The R. F. D.!

The blessed little box of tin
Beside the winding road,
What treasures may be stored therein
From out the postman's load!
The barefoot children caper down
And crowd about to see.
Ah, better than the joys of town—
The R. F. D.!

The long and lonely country days
Are lightened by the mail.
And cheery hopes and better ways
Spring in the postman's trail.
And farm and city, understood,
More happily agree.
God bless the bond of brotherhood
The R. F. D.!
—Youths' Companion.

EQUIPMENT MEANS ECONOMY.

I saw an aluminum pail the other day that struck me with great admiration and envy. It had a lid that was easily removable and easily clamped on so tightly that no un-intelligent effort could remove it—and this lid was perforated by a grating of small holes at one side allowing air to pass in, or offering a splendid means of draining off water or liquid from anything inside the pail.

I made clabber cheese in this pail and found the process wonderfully simplified by this convenient appliance. Besides, the pail itself was so light, so easily cleaned, it was a simple joy of possession to the woman who owned it.

When I consider the rapid growth of convenience in the household the past twenty years, I am struck with fresh wonder and alarm at the growing distaste for housework that posseses the young women of our time.

When I remember the heavy wooden tubs, iron tea kettles and dinner pots our blessed grandmothers wrestled with and came out serene and smiling, I feel like shaking the degenerate women who complain, today, of drudgery.

This complaint is, of course, the mere echo of our progress along the line of convenience. There is no limit to human aspiration. Wonderful as the telephone is, I heard a young woman say, not long ago, that telephone poles were terribly primitive looking things that she believed we would get rid of them some way. Sure enough, I soon heard that they were running the telephone wires under ground—and who knows when a still more subtle means of communication may be discovered?

Grasp the Situation.

Now the thing we must learn to do in this world is to grasp the situation as it dawns, extract the good, discard the evil, and move along with the world as it goes. This does not mean, as many mistaken women have supposed, that we are to throw down our old responsibilities and cares, shake off the claims of the kitchen and the household and step forth emancipated from the ancient work of woman—the household work. But it does mean that we are very stupid if we do not at once grasp every improved means of convenience possible to human life.

Not all of us are assured of more than one comfortable existence—the life here on this little planet we call the world. People are wont to allow this "spangle of existence" to slip away without sensing to the fullest its possibilities. I believe this is particularly true of a certain class of farmers. They fail to realize the possibilities of home life.

The big work of agriculture is calculated to occupy to the fullest a man's mind. He is so tired when he comes to the house that anything like a meal or a bed appeals to him as a luxury and he is likely to sit down in great contentment in the kitchen or any place else where there is a chair. The fact that his wife may have been in the kitchen all day and may be feeling quite tired of it, scarcely occurs to him.

This used to be a very common condition of farm life, though it must be admitted that in these days it is more than likely that the woman has "hitched up" and gone to town or to a meeting of the neighborhood club or the church Ladies' Aid Society.

At all events, the old time farmer's wife who seldom left the place, whose hands were constantly full of work of some sort or other is certainly a thing of the past in America.

Yet with all our progress and our freedom we still hear women complaining of having no time—of being constantly in a rush—of feeling intensely the complexities of modern life.

Washington Woman Saves Time for Garden.

I know a woman who makes her living on a five-acre "ranch" in Puyallup Valley, Washington. She is the most systematic person I ever knew and it is the rule of her life to investigate everything that is called a convenience and to get it for her use in the kitchen and on the ranch if she sees that it in any way expedites toil or saves wear and tear of brain and muscle.

She quickly grasped the fact that the steam cooker gets dinner while she hoes or plants or plows her crops; and I have no doubt if the electric washer or mangle were a possibility for her she would have them, because she is alert to every mechanical possibility of getting a living out of five acres of ground.

I am sure the farmer after watching her employ every clever idea by way of simplifying the interior work so as to get more time for the out-of-door work would be for going home, at once, and fitting up his kitchen with every device for shortening the labors of his wife and rendering her thus free for the remunerative work of dairying and poultry raising and small fruit growing that a woman may so healthfully and easily manage.

Saving of Work; Also of Money.

I believe if all farm women were fully awake to the economy of convenience the men would also become awake to it.

Much is wasted on the farm by following along old drudgery lines of labor. It is not so much to "save work" as to save money and add intelligently to the family income that the farm woman should turn her attention to all that expedites her work and brings her better results.

Take as a sample instance the aluminum pail. I had my cottage cheese made in five minutes, because of the strainer in the tight lid of that pail. To be sure the first outlay for the pail was considerable, but the moments saved in a year's time will re-

turn in actual cash value much more than the difference between the aluminum pail and a common tin one.

If you will study the subject of proper equipment in the farm kitchen you will discover that results attained and money saved are quite as great in proportion as those attained on the farm by proper machinery and scientific farming.

Modern Kitchen Training Needed.

Though I say it with some hesitation, fearing the reproach of my fellow women who undoubtedly do "work hard," there is a lot of very unintelligent work done by women. If there is anything in the world that we need worse than we need a general religious awakening, it is training in practical and economical domestic work for girls. Somehow, by some means, housekeeping must become more scientific, less hap-hazard, less wasteful and on the whole more cheerful and matter of fact.

Women have been shielded in many secret violations of all laws of sanitation, in bad cooking and clumsy and unsanitary methods, by the very privacy and seclusion of home. It was nobody's business if they fed their families on soggy, greasy food and did their work in a slip-shod, unsanitary fashion.

But year by year we are coming out of this. Our modern notion of sanitation and convenience—our ridding ourselves of unclean things that once cluttered our houses, filling our lungs with dust and disease germs, the clean bare floor, the light, quickly scoured cooking vessel, the fresh air and sunshine idea chasing out the shadows that once lurked in our homes—all of this is good, intensely good, and wholesome.

In a time not far distant we shall see the kitchen of the farm house the most important and interesting place on the farm. For the women will be educated to be the mistresses of a new economy the importance of which can scarcely be exaggerated.

And if woman should continue to dislike the kitchen, to prefer the counter, the typewriter or the general branches of business or the professions, then men will take up the vocation of cooking and cleaning in the household since this all important work by which we live and have our being is the one branch of human industry we never can dispense with while the world stands.

The man who through stinginess or fancied economy refuses his wife a well-equipped kitchen strikes at the rest of his own business, crippling then and there one of the most important factors of the industry he hopes to succeed in.—Agricultural Epitomist.

A RISING FINANCIER.

The old man was perched upon a high stool, figuring up the day's sales of dry goods, groceries, and hardware, when his son came in with a rush.

"Say, Pop," exclaimed the young man, "if I can buy a $300 horse for one-fifty will you take a chattel mortgage on him and help me out with the cash?"

"What kind of a hoss, my son?" inquired the father cautiously.

"Say, 4 years old, sixteen hands high, weighs 1000 pounds, and sound in wind, limb and bottom."

"That sounds good to me, my son, and I want to do all I can to help you along in the world;" and he reached down into the safe for his roll. "How much do you want?"

"A hundred and forty-nine, fifty."

The old man gasped and caught hold of the desk.

"What?" he exclaimed.

"A hundred and forty-nine, fifty. I've got half a dollar."

Slowly the old man shoved the roll back into the safe.

"My son," he said softly, "you are wasting time trading hosses. What you ought to do is to go into the loan and trust business."

HE STAYED ON THE FARM.

Mr. James B. Weaver, Jr., in The World's Work for November, very enthusiastically describes the present increasing prosperity of agricultural conditions of Iowa. The reason for it, he says, is that the farmers aren't afraid to do new things in new ways.

For instance, this is what happened to a farmer who had always been satisfied with "good enough." His son, after a half day's attempt at plowing corn in the muck upon the margin of a ten acre pond situated in the center of a forty acre field, came to the table one noon hour with the startling announcement: "Father, that pond will be tiled or I quit the farm—either the slough goes or I go—take your choice." And the pond "went." Today that boy, riding his gang plow, descends into the old pond basin that three years ago was the habitat of the muskrat, with the very satisfying consciousness that from its virgin soil, the product of untold centuries of accumulation of vegetable mould, shall come for each acre eighty to one hundred bushels of corn.

COMMON SENSE HINTS.

Every one should take a walk daily. Walking improves the action of the heart, lungs and stomach, aids digestion, takes out the kinks and removes the grouch.

For tender and sore feet, bathe in hot water, in which a half tumbler of vinegar and a small handful of salt, has been added. Dry carefully and rub with cold cream. Dusting talcum powder in the shoes will prevent the burning sensation, so prevalent in summer.

FURTHER PROOF.

"Why did you quit your job?"

"The boss said I was a fool."

"But he didn't discharge you, did he? Did you resign just for that?"

"Yes."

"Well, I guess the boss was right."—Toledo Blade.

There is always work,
And tools to work withal, for those who will;
And blessed are the horny hands of toil!
The busy world shoves angrily aside
The man who stands with arms akimbo set
Until occasion tells him what to do;
And he who waits to have his task marked out
Shall . . . leave his errand unfulfilled.
—Lowell.

If a man write a better book,
Preach a better sermon,
Or build a better mouse trap
Than his neighbor
Though he build his house in
The wilderness
The world will make a beaten
Path to his door.
—Emerson.

RAISING FOODSTUFFS.

"I know a city man who is making a fortune raising cucumbers on a town lot."

"How does he do it?"

"He buys them from the producers for 10 cents a dozen and raises them to 5 cents apiece."—Kansas City Star.

The Marlin Model 20 REPEATING RIFLE

You can buy no better gun for target work and all small game up to 200 yards.

Without change of mechanism it handles .22 short, long or long-rifle cartridges perfectly. The deep Ballard rifling develops maximum power and accuracy and adds years to the life of rifles.

The solid top is protection from defective cartridges—prevents powder and gases from being blown back. The side ejection never lets ejected shells spoil your bead and allows quick, accurate repeat shots. With simple take-down construction, removable action parts,—least parts of any .22—it is the quickest and easiest to clean. A great vacation rifle. Ask any gun dealer.

The 136 page Marlin catalog will help you decide what rifle best suits your individual desires. Send 3 stamps for it today.

Hay.

Scott, Magner & Miller say:

Arrivals for the week ending today have amounted to only 2,500 tons. These are the smallest arrivals that we have had in any week during the current season. Considerable of this amount consisted of alfalfa, which is now practically cleaned up from the river section.

The arrivals during the last few weeks have been remarkably moderate, and not nearly enough to supply our usual current demand. Therefore, it is plainly evident that the dealers' warehouses in the city and the consumers' barns have been heavily drawn on during this time, and therefore stocks of hay on hand in the city have been materially reduced, and at the present time are comparatively lighter than usual.

The market during the week has taken on better color, and a generally firmer and advancing hay market appears plainly now to be in active process of early development. We have had no rains to start the green feed, and we are now experiencing considerable inquiry for hay from interior points where stocks are light, and where much pasture is usually depended upon.

There is somewhat of shipping to Pacific Coast points steadily going on, and while these orders are not large in themselves in the aggregate, they have considerable bearing on our daily market, as they go to absolutely outside points, and relieve the tracks here.

While we cannot quote any definite advance in prices, the whole situation appears to be strengthened by these recent developments.

The alfalfa market has also taken on more strength, as the heavy shipments from the river have now practically ceased, and from now on considerable of our supply must necessarily be drawn from other districts.

Deciduous Fruit Market

Sacramento, Nov. 25, 1911.

F. B. McKevitt, general manager of the California Fruit Distributors, reports:

The following gives the number of cars of deciduous fruit shipped from all points in California for the week (seven days) ending Friday morning, Nov. 24, 1911:

Pears: Two cars. Although shipment of two cars of this variety is reported this week, none went forward, these cars representing shipments made previous to our last report, but not reported in time to appear there. There are no more pears to go forward, and the movement for the season is now concluded.

Grapes: Ninety-three cars. The shipment of this fruit is now nearly concluded. While it is not possible for us to tell what the future movement will be, in all probability it will not exceed twenty-five carloads, and will consist entirely of Emperors.

Light to heavy frosts are in evidence every morning.

Comparative statement of shipments up to Nov. 18, 1911:

	1910.	1911.
Cherries	250½	216¼
Apricots	289¾	214½
Peaches	2,517¾	2,027
Plums	1,552½	1,366
Pears	2,361	2,322¾
Grapes	4,898½	6,254½
Sundry	17	16¼
Total	11,887	12,417½

Citrus Fruit Market

LOS ANGELES, Nov. 28, 1911.

Navels are being well received in every market. The auctions are still showing Valencias, but shipments have long since ceased. Some Navel shipments have begun from south of Tehachapi, but none of these reached the Thanksgiving market. From now on until Christmas the northern groves will show activity in picking, and nearly every packing house will be crowded to its limit.

Lemons are lower in price than for some time, but the general condition of the market is fair. Foreigns are not coming in large quantities, and fair prices will doubtless continue.

Shipments.

Shipments of oranges to date since Nov. 1, 1911: From Southern California, 83 cars, lemons 386, total 469 cars. From points north of Tehachapi, 1,013 oranges, 43 lemons, total 1,056 cars. Grand total from the state of 1,525 cars. To same date last season from Southern California points: Oranges, 176 cars; lemons, 390; total, 566 cars.

NEW YORK, Nov. 24.—Two cars Valencias and two cars lemons sold. Market strong on Valencias, firm on good stock lemons. Raining.

Get 2 to 6 Lbs. More Milk per Cow a Day

From the Alfalfa You Feed

Alfalfa is a good milk producer—but you can feed it so as to get 2 to 6 pounds more milk per cow a day.

Your cows like it—but it can be made still more palatable. It is a healthful feed—but it can be fed so as to insure your cows being and keeping in absolute health.

Alfalfa fed with Steam Dried Beet Pulp will make every one of your cows earn $10 to $20 more a year. Multiply these figures by the number of cows you own and you can safely count the result as your increased profits.

Alfalfa is an unrivalled feed for the dairy cow—but it should not be used alone. Cows need variety. They are human to that extent. Alfalfa supplies the important element of protein, but, fed alone, it is lacking in carbohydrates—an equal need in a milk producing ration.

STEAM-DRIED BEET PULP
Just Like Roots
Makes More Milk

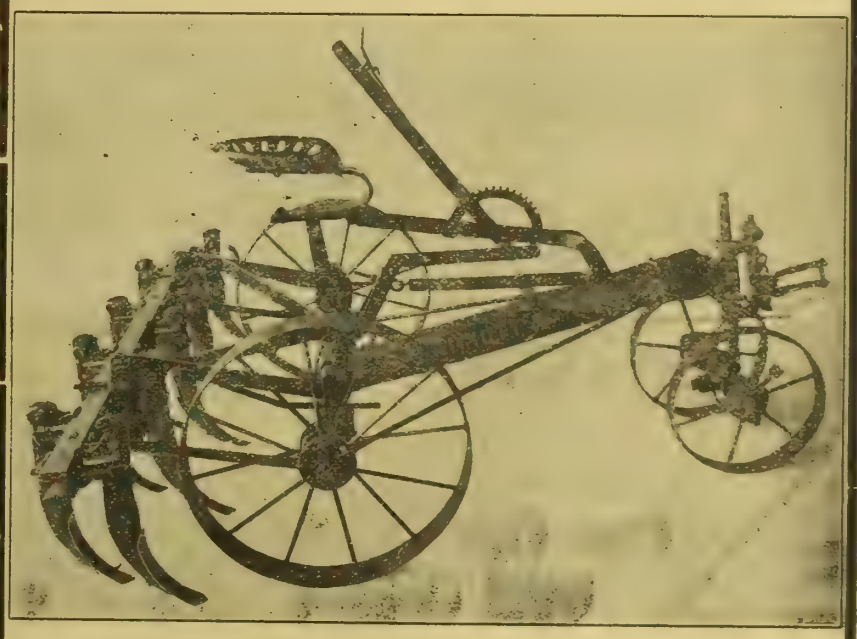
Steam Dried Beet Pulp is the ideal combination with Alfalfa. Used in the proportion of 8 lbs. to 15 or 20 lbs of Alfalfa Hay—all the Alfalfa a cow will eat—gives a ration almost perfectly balanced. It is light, bulky, succulent, easily digested, absorbs water quickly and swells to about six times its original bulk. It is cheaper than bran or rolled barley, and it is a greater milk producer. Steam Dried Beet Pulp is the clean beets dried by steam as soon as the sugar factories have extracted the sugar. Be sure you get Steam Dried. It is uniform in quality and color, never burned or blackened by smoke, always clean and pure. Keeps indefinitely. For convenience in handling, it is packed in 100 lb. sacks.

Steam Dried Beet Pulp is also a splendid food for horses, pigs and poultry, and raisers are placing more and more dependence upon it as a feed for their choicest stock. Steam Dried Beet Pulp is rapidly becoming a staple product among feed dealers. If yours does not handle it, write us direct. We will see that you are supplied.

THE LARROWE MILLING CO., 607 Central Bldg., LOS ANGELES, CALIF.

Be Sure it's Steam Dried.

The Arnott Improved Orchard Cultivator



WE are pleased to be able to announce that prompt shipments can now be made of the **New Arnott Cultivator** as shown above. This has been for years the most popular cultivator in the Southwest and with the **New Fore Truck** it is way in advance of any other orchard tool.

Sold by Leading Dealers everywhere, or write us direct if your Dealer cannot Supply you.

Farmers and Orchardists
are becoming enthusiastic about the

La Verne Rotary Cultivator

The La Verne Rotary Cultivator carries no soil with it. Can be used at a greater depth and with less draft than any other cultivator on the market Works close to the ground. Has no wheels or attachments to catch limbs or tear off fruit. Can be used close to the trees where other tools do not reach.

Farmers and orchardists using the La Verne Rotary Cultivator place their irrigation periods from one to two weeks further apart, as the La Verne leaves the soil in condition to absorb more water and to retain the moisture for a greater period of time.

The La Verne rotary action does away with the dragging motion on the ground, preventing the formation of "cultivator sole" and permitting the water to reach a depth where it does the most good.

Vol. XXXVII. No. 23. LOS ANGELES: THURSDAY, DECEMBER 7, 1911 One Dollar the Year

The Advance of Denmark Under Co-operation

By Thos. Wm. Cowan, Taunton, England

The principle of co-operation has been adopted in every part of Denmark and to this and the wonderful system of education available for its people is due the great progress of that country during the past thirty years.

The area of Denmark is 14,844 square miles (9,375,403 acres), with a population in 1906 of 2,588,919 (174 per square mile), nearly one-half of whom live exclusively by agriculture. The exports to the United Kingdom of agricultural produce in 1909 amounted to £18,768,417, about $93,000,000.

The first co-operative creamery was organized in 1882, and the dairying movement has made such progress that in 1902 there were 1150 co-operative dairies with a membership of 148,000, and dealing with 750,000 cows. The amount invested in the erection and equipment of Danish creameries exceeds £1,500,000 sterling.

The first bacon factory was erected in 1887; there are now over 30, and the progress of co-operative work in the bacon industry is quite as striking as in the case of butter.

The egg industry has also improved immensely owing to the application of the co-operative principle to collecting, grading, packing and export of eggs, The "Dansk Andels Aeg-export" was founded in 1895, and has 400 societies affiliated with it, with 30,000 members. The eggs are purchased from the farmers by weight irrespective of size and are packed by the society. The packing is done by women, while the men make the boxes and nail on the lids. Every egg can be traced to the original supplier as the collector puts a number on the egg, and any member guilty of sending a stale egg a second time is expelled from the society. Dirty eggs are not accepted.

The production of these commodities of the breakfast table, namely butter, bacon and eggs, practically absorb the whole energies of the rural population and the tendency has been not only to increase the actual output, but to enhance the quality of the product. All these items of export are subject to constant supervision of central committees watching all that concerns the efficient management, and supplying the most up-to-date information as to methods of production and access to markets. There is no "cutting prices" as the understanding between the whole of the Danish creameries is such as to raise the standing of Danish butter in the market rather than depress it.

In addition to the above branches of agricultural industry, the spirit of association manifests itself everywhere. There are co-operative societies for the improvement of the breeds of cattle, pig improvement, poultry improvement and distribution, purchase of agricultural requirements, joint purchase and use of agricultural machinery, and in various other forms connected wtih agriculture.

All these societies are self supporting, and, with the exception of the agricultural societies, receive no grants from the government. There is no such thing as "taking of shares" in Denmark. The preliminary organization is started by ascertaining (a) the quantity of raw material available in the particular district for the purpose of the society, and (b) the extent to which the farmers were prepared on the principle of "each for all and all for each" to pledge themselves to secure the necessary capital to enable the business of the society to be successfully carried on, and, this being accomplished, in giving binding effect to the twofold agreement, namely, that they should only dispose of their milk, pigs or eggs through their own society, and that they should be jointly and severally responsible for its liabilities.

There is a distinct organization for each form of society, and a separate body is always formed to take charge of each kind of work. At the same time business relations are arranged between these district societies, so that, for example, a man who obtained manures and seeds through his agricultural supply society could have the amount deducted from his milk account at the creamery.

There are hardly any debts due to merchants by the farmers, as, in consequence of the regular receipts for their agricultural output from the various cooperative societies, the system of monthly payments has become almost universal. This places the Danish peasant in a position of security and independence which adds materially to his efficiency as an agriculturist and to his social status as a citizen.

The success of the Danes may be attributed to (1) the universal application of the cooperative principle to every department of agriculture, and the invariable obligation imposed upon the members in all societies to support an institution founded by themselves and maintained in their interest against all temptations of "rings" or "syndicates." (2) The practical interest which the government takes in these cooperative organizations. Conferences of cooperators are held in various districts, a public officer being invited to attend them, whose function is to advise the minister for agriculture, and all questions of public policy affecting agriculture in Denmark are framed in accordance with the opinion advanced by these conferences. At the same time the various experts employed by the government are in constant touch with these societies, and are always available to give such technical advice as may be useful in the farming industry. (3) The unremitting industry and zeal of the people themselves.

The smaller societies federate and make up one large society for purchasing. As an example of working which applies to all the societies, the "Funen Cooperative Feeding Stuff Society" can be taken. It is made up of forty-seven cooperative dairy societies, which guarantee 20,000 cows. The guarantee consists of two kroners per cow, but no society becomes a member under a guarantee of 300 kroners, and are bound to purchase their requirements for a period of three years, and each individual farmer is obliged to purchase at least 300 pounds of feeding stuffs in the year. The yearly trade is over one and a half million kroners (£83,300).

These societies are independent of government aid.

The agricultural associations known as "Landhoforeninger" receive substantial assistance from the government and deal with almost every phase of agricultural development. The societies are cooperative in character, and the members are bound to observe the obligations imposed by the rules, and the society is supported by the common law of the land in recovering penalties for violation of the regulations made for their government. No society is recognized as such unless it has a membership of 150 farmers who contribute at least 300 kroners annually to its funds, and all are obliged to furnish a balance sheet and full report of their operations to the minister for agriculture before the first of April.

There are 107 of these associations, with 64,800 members, who contribute 160,000 kroners annually to the societies' funds. The amount voted by the government for grants is aout £10,000, allotted as follows:

	Kroners.
Agricultural and live stock experts	15,400
Premiums to cattle shows	75,000
Supervision of milch cows	3,600
Premiums and traveling expences for farmers	72,800
Local experiments and demonstrations	7,600
Other purposes	700

The government also gives subsidies for improvement in their breeding of cows, horses and pigs. There is no special tax, but the money is paid out of the amount allotted to the Department of Agriculture. All the institutions organized in the interest of agricultural production have, as a fundamental principle of their credit, unlimited liability. The government gives agricultural credit for small peasant proprietors. It has placed five million kroners (about £280,000) at the disposal of the farmers. Should the farmers of a village wish to borrow money, each for his own object, they form a society which can borrow money from the government on the joint guarantee of the members. The limit of loan to a society is 6,000 kroners (£333). The state pays the taxes on the loans, and has allotted a certain sum to pay for the expenses incurred in the organization of these societies. The maximum of any loan to an individual farmer at any one time is 50 kroners (about £2.15). He is obliged to repay this loan within nine months, and the rate of interest is 4½ per cent, or 1 per cent over that which the society pays the government. The money is repaid to the government at the end of nine months, but prior to the repayment the members of the society may state how much they wish to borrow after repaying the original loan, and in this way a certain amount of the capital borrowed from the government is used as a floating capital, being payment made by the right hand and received back by the left, between the society and the state. There is no control by the societies or the government as to the manner in which each individual applies his loan. These loans, however, are invariably applied to purposes which result in a profit to the borrower.

There is a very useful book published in Rome, Italy, by the Italian government, entitled "Bulletin du Bureau des Institutions Economiques et Sociales," Annee 1, Volume 1, No. 1, 30th September, 1910. On page 179 and following pages a great deal of information is given on cooperation in Denmark. In this it is stated that in 1909 (to which date statistics are given) there were 154,568 properties, on which there were 1,059,956 cows supplying cooperative creameries, all working without pecuniary assistance from the government.

THE RACE TO THE SWIFT.

Who wouldn't like to be a farmer if he could live in Iowa and unlock the state's treasure houses in the manner described by Mr. James B. Weaver, Jr., in the World's Work for November? Does the occupant of the city flat excuse his purchase of an automobile by pleading the necessity of a spin to the country after supper for fresh air? The Iowa farmer is not slow to take the hint. With him it is change of scene. Stand aside, for here they come every evening after supper down ten thousand highways—"Bill" at the wheel, and by his side "Dad," "Mother," and the remaining household. No delay for elaborate toilets, with shirts open at the throat, bared heads and sleeves rolled back, off they go twenty to thirty miles, to town and back, forgetting for two blissful hours in their careening joy-wagon the heat and fatigue of the day.

SPLITTING ORANGES.

Mr. Carroll B. Smith of Redlands writes:

"I was glad to notice Prof. Coit's article on the "Splitting of Oranges," in the last Cultivator, and am enclosing herewith an article on the same subject which was published in the Los Angeles Times in November, 1901.

"It differs a little from Prof. Coit's presentation, but the general conclusions are the same in both articles, namely, that weather and climatic conditions are responsible. Prof. Coit has added considerably to my article by the scientific way he treats the subject, but, at the same time, my article covers certain conditions he does not mention under which splits occur and do not occur, which might suggest a remedy."

The Splitting of Oranges.

"Certain characteristics are found by observation to be peculiar to all split oranges:

"(1) Splitting commences at the time of year when fruit is about to turn.

"(2) The most splits are on the south and southwest side of tree.

"(3) The splitting starts, and rind is thinest, at the blossom end.

"(4) After an orange is once split the skin cannot be pressed together again without breaking the flesh of the fruit.

"(5) Trees which show the most vitality and strongest feeding power have the most split fruit.

"There may be rare exceptions to the foregoing statements, but not enough to disprove them as general rules. Now if these are true and general characteristics of split fruit can we not find a cause?

"The circulation of nutriment through the orange is first from the stem through the core to the blossom, while the flesh is fed next and the skin last. Possibly skin and flesh are fed together from the membrane between them, but in either case ripening may and does commence on the outside without interfering with the continuing development of the fleshy parts. And it is also true that the navel may remain green long after the color is completed, and the orange has ceased to increase in size. I have measured several dozen of fully-colored oranges with green navels; tagged them with the date and measurement, and two months later found the navel turned yellow and the oranges average increase in circumference to be only one-eighth of an inch, an inconsiderable amount. This looks as though ripening might go on beginning at the outside of fruit while growth continued on the inside. The last parts fed will ripen first.

"To state this fact in another way: The evidence of assimilation is the presence of chlorophlyll or green coloring matter of leaves, stems, and rind of fruit. Now when fruit begins to color the green disappears, or what is the same thing, assimilation ceases. When assimilation ceases so does growth. The navel remaining green long after assimilation and growth have ceased in the rind shows that growth is continuing on the inside and if it proceeds too far will split the fruit. Especially is this the case when the rind begins to lose the green color. Growth is evidently less rapid there than in the fleshy parts. There is a check, partial or complete, in the growth of the rind, but less of a check if any in the fleshy parts. This is evidenced again by the fact that fruit once split cannot be pressed together again without displacing some juice or flesh. The development of the rind certainly does not keep pace with the growth of the fleshy parts when once it is split. Of course the edges of split rind turn yellow most rapidly and we would expect growth to cease there, but in a new split on an orange quite green, edges and all, you cannot press the open part together.

"If chlorophyll is the evidence of assimilation (this seems to be a fixed rule in the biology of plants) and the navel remains a deep green while the rind shows partial coloring or light green, it certainly looks like unequal growth in the parts. The part which has ceased to grow must give way to the other.

"Trees which show the most vitality and strongest feeding power have the most splits. The Washington Navel is a vigorous grower and feeder and will have more split fruit than St. Michaels, Mediterranean Sweets or seedlings. Old stocks budded over show the greatest number of split fruit in the first few crops. This is because the root or feeding power of the tree is large in proportion to the "head" it has to feed. The vitality of that tree is exceptional and growth persistent. Young stock on virgin soils also has exceptional vitality, and the first crops will have a large proportion of split fruit.

"Now as to the cause: Suppose that about the time fruit is well developed and ready to turn, the weather has been warm and all conditions favorable to growing, there comes a cold night and day, so that growth receives its first check, will not this show at the extremities first? The weather has not been cold enough, we will suppose, to chill the earth and sap. The fruit being ready, may turn, this lessens assimilation and growth in the rind. The earth is still warm and sap has not been chilled so growth may continue with inside parts. This would cause splitting. Such a condition might be repeated. Growing weather might alternate with checking weather several times so that fruit developing a week or two later would be caught and splitting would be excessive. If the whole tree could be put in dormant condition at once when fruit is ready to turn there would be no splitting because the check to the sap and to the growth of fleshy parts of fruit would follow too soon. I have seen trees in isolated places as a corral or flower bed, where they did not get the best of care, carrying a full load of fruit, apparently healthy, and not have a split orange. This might be because the tree has not the same persistent growth and vitality; the earth is not as warm, being uncultivated, so when the first check comes the whole tree is ready to stop growing.

"Such I believe to be a cause. Let it be conclusively established or refuted and the remedy will be a matter for further thought and investigation."

A TIGHT SQUEEZE.

Stella—Can you dress within your income?

Bella—Yes, but it is like dressing in a berth in a sleeping car.—Harper's Bazar.

BLACK ROT OF NATAL CITRUS FRUITS.

Some interesting results, arising from an investigation into the cause of a black rot of various citrus fruits in Natal, have recently been published in Science Bulletin No. 4, of the Transvaal Department of Agriculture, entitled On the Structure and Life-History of Diplodia natalensis, n. sp., by I. B. Pole Evans, M. A., plant pathologist to the Transvaal department of agriculture.

External Symptoms of Disease.

The disease first appeared on lemons shipped to the Transvaal from Natal, but subsequent investigations showed that it could occur on all forms of citrus fruits. The account of its symptoms, as given by Pole Evans, is as follows:

"The first evidence of disease is a translucent or watery appearance of the rind, usually around the stalk end of the fruit. This is quickly followed by a softening, and gradual brown discoloration of the affected tissue. The brown discoloration, when it has once appeared, spreads very rapidly and uniformly over the whole fruit, which then becomes distinctly sticky to handle, while at the same time a greenish-brown liquid exudes from it where it comes into contact with anything on which it is resting. Very soon after this a dark olive-green to black discoloration appears at the stalk end, and from thence encroaches over the whole fruit, until it is converted into a black, mummified mass, with a very wrinkled and shrivelled surface.

"Fruit in this condition, if left exposed to a dry atmosphere, soon dries out, and remains indefinitely a hard body, exceedingly light in weight, but retaining to a considerable extent its original form and shape. The loss of weight in the fruit can be detected almost as soon as the brown discoloration appears. When a dry lemon is cut open, the whole of the pulp has become absorbed, and nothing remains but a dark, fibrous mass of tissue.

"The pips and radiating septa are usually covered with a dull greyish growth. On examining the external black discoloration more closely with the naked eye or with a hand lens, it is seen to be due to the formation of a number of small black patches under the epidermis of the rind. As these dark masses increase in number they run one into another and coalesce, so that the whole surface takes on a homogeneous dark color.

"If affected fruit is kept under moist conditions, a very different state of affairs occurs. The surface very soon becomes studded with innumerable tufts of hyphae, at first greyish-olive in appearance, but which later on turn darker colored and then eventually completely invest the fruit with a dark felt-like mycelial growth."

Cause of the Disease.

The disease is due to a species of Diplodia, believed by Pole Evans to be different from any previously described, to which he has given the name Diplodia natalensis. The fungus produces scattered pycnidia beneath the rind of infected fruits. The spores are biseptate, dark olive-brown in color, and very similar to those of the cacao die-back fungus, except that they are marked with bands running along their length. In artificial cultures, under damp conditions, the pycnidia are produced in small hummock-like protuberances covered with a thick felt of dark olive-green hairs; this is similar to the manner in which those of Thyridaria tarda are produced under similar conditions. The resemblance between these two fungi is strong, though there are some points of difference.

Infection Experiments.

These left no doubt that the fungus Diplodia natalensis was the cause of the disease described. They further showed that the fungus was capable of living on apples and peaches, and of producing characteristic pycnidia upon these at the end of ten days, although there was no formation of these organs on infected lemons at the end of fourteen days. In fact, on lemons and oranges, pycnidia only occur on the black sclerotial bodies found in the infected fruit after such bodies have passed through a resting period of two months. If after this, the fruits are exposed to the right conditions of temperature and moisture, pycnidia will develop.

Another set of inoculation experiments on lemons gave rise to some points of interest. It was found that infection occurred on placing spores of the fungus upon the stalk scar, both when this was punctured with a sterile needle and when it was left untouched. Furthermore, it was observed that spores placed on a slightly wounded or abraded surface of the rind could cause disease, but that they could not do so when the rind was intact. Another point revealed by the experiments was that in many cases there was an incubation period of from ten to fifteen days between the date of infection and that of the first appearance of the disease. Thus fruit apparently quite sound might be packed in a case and develop the disease in transit.

Preventive Measures.

The chief source of infection is the mass of spores formed in the pycnidia arising on mummified fruit left lying about the orchards. The principal means of reducing the prevalence of the disease must, therefore, lie in destroying, by heat, the fungus contained in all such mummified fruits, which must be carefully collected and removed from the orchards for the purpose.

A fungus very similar in appearance and possibly identical with that found in Natal has recently been shown to cause gumming of citrus and peach trees in Florida. An account of the inoculation experiments carried out to determine this was published in Mycologia, Vol. III, p. 151, under the title A Gum-Inducing Diplodia of Peach and Orange, by H. S. Fawcett and O. F. Burger. It was shown by cross-inoculation that the fungus on citrus caused gumming on peach trees, and vice versa. The same fungus also occurred on rotting fruits of orange and grape fruit, while inoculations with it caused softening and decay of oranges, lemons and apples, in the space of one to two weeks. In the case of the two former fruits it was only necessary to place the mycelium on the stalk end to induce decay, while the fungus could subsequently be recovered from the diseased fruit. The authors are of the opinion that the Diplodia causing the gumming may well be the same as D. natalensis, though the point is not yet established.—Barbadoes Ag. News.

Dow Non-Pulsating Pump

We have been building Pumps and Compressors for more than thirty-seven years and in that time have originated many types of pumps, most of which are now in use throughout the world. Yet we believe our Non-Pulsating Pump is a greater improvement than any we have yet brought out. Its efficiency, simplicity, and reasonable up-keep costs are remarkable.

If you care for advance information, we will be pleased to give it. Address or call at either office.

New Deal on Light

My Friend, The 20th Century Light Co., will sell 20th Century Generators direct to you from "MAKER TO MAN" for a period of 30 days—cutting out the Agent's commissions.

The Generators are made of the same material and the same workmanship and carry the same five year GUARANTEE that has made them among the first in the Acetylene trade. Ask your neighbor who has a model G or Model H Tandem and he will tell you what they are.

Made in Los Angeles. Does not affect your insurance. Will furnish you man to install or you may do so yourself, or your local man. Will give you the Agent's discount on the fixtures as well.

And now, my friend, if you want a light in your home and can afford to overlook this opportunity to get it at a discount of about 40% saving—that is your business! It is my business to tell you that we have absolutely cut out the middle man, who we have found promised a great many things he does not write in on the order, that's the reason we are cutting him off and giving you his profits.

Does this sound reasonable? We will make just as much? You will save money? So my friend, when you come in measure the height of your ceilings, and if we are not able to convince you that the goods are right as well as the price with a thirty day free trial, we will take them back at the end of the time.

This AD will not appear again! We mean business, the day is past for so many profits!

Yours truly,

20th Century Light Co.

Deciduous Fruit Culture

SPRAY FOR BLACK SPOT CANKER.

Apples having this disease have been examined this week at the Washington State Experiment Station and found to be distributing spores. Spores are also distributed at this season from the cankers on the limbs and trunks of diseased trees. These spores are carried by insects, water drops and wind to other parts of the same tree and to neighboring trees. Many of them will develop new cankers. To prevent this spread of the disease, affected orchards should be sprayed as soon as possible after the apples are picked. The spray solution used may be either Sulphur-Lime (specific gravity 1.02), or double strength Bordeaux, as preferred. As soon as the leaves fall another spraying should be given. The spraying should be supplemented by a systematic destruction of all disease-spotted apples. Much of the infection of stored apples is brought about by mixing diseased apples with the good fruit during picking and storing. Observations recently made by experiment station men at Chehalis indicate that flies may be instrumental in spreading the disease. Under a number of trees were decaying windfalls, many of which showed the characteristic Black Spot rot. During the sunny part of the day flies and other insects were continually flying to these apples and later flying off into the trees. If the windfalls were carefully gathered and destroyed, this source of infection would be eliminated.

It is comparatively easy to distinguish the Black Spot rot from the Fruit Spot, which is also common in the orchards of the state. The Black Spot rot has a small point or opening in the center. If the spot is small this will be surrounded by a narrow border of light brown. If the spot is larger, concentric rings of light brown will surround the point and the spot will be darker brown around the edge, which is rather sharply defined. The spot also seems flat and shallow as compared with the Fruit Spot infection. Spots which are producing spores are usually one-fourth inch to one-half inch in diameter.

TUMBLING MUSTARD.

(Cisymbrium altissimum.)

This weed is popularly called in eastern Washington the "Jim Hill" mustard. It is properly known as the Tumbling mustard. It is an annual, that is, it goes to seed each year and dies to the ground. The plant grows to an extremely large size, making a real tumble weed. It bears a large number of seeds, which are oily and therefore live a long while in the soil.

The best way to fight this weed is to go onto the land in the fall and disk it lightly, thus covering the seeds just enough to make them sprout. Do not plow, as this will bury the seeds to such a depth that most of them will not grow promptly, but will lie in the ground for years, and as they are brought up by each successive year's plowing will fill the field with weeds. If the land is lightly disked, the fall rains will usually cause the seed to sprout. If the land should dry off enough, the sprouted weeds may be killed by disking or harrowing, or any other sort of weed-killing cultivation, during the winter. But if, as is more probable, the land is too moist to cultivate in the winter, go on the land in the spring as late as possible with a weed-killer and kill the young weeds. After this the land may be plowed and planted to some spring crop such as barley or oats, or it may be summer fallowed. The greatest danger is in burying the seeds. Otherwise, the weed is not hard to kill.—Bul. 6, Wash. Ex. Sta.

BIRD INVESTIGATIONS.

Secretary Wilson has just received some interesting and valuable information from the biological survey by a special investigator.

The study of bird migration has been continued and has resulted in the accumulation of much valuable information on the distribution, breeding times, and habits of birds. This information is of value as a basis for legislation having for its purpose the proper protection of game and other birds. A bulletin is in preparation on the distribution and migration of herons, cranes and rails, similar in scope to the one recently published on the shore birds. A report on the wood rats of the genus Neotoma has also been received, and for the first time these native mammals are fully characterized and their distribution given. Maps show the range of every known species inhabiting North America, and a brief account of their habits and economic status is given.

By direction of Secretary Wilson the survey in co-operation with the University of Iowa sent an expedition to Laysan Island. The members of the party acted as wardens during their stay and secured specimens of the flora and fauna, some for the biological survey, the rest to form the basis of a panoramic representation of the bird colony for the University museum. A special representative of the department who had formerly visited Laysan, accompanied the expedition, to make a report on the present condition of the birds as compared with eight years ago. From this report it appears that none of the species nesting in the island has been exterminated, but there has been considerable decrease in the number of albatrosses.

Depredations were committed on the Tortugas Reservation by fishermen, who, during the winter visited Bird Key and stripped the warden's quarters of everything movable, including materials stored there for repairs and improvements. The co-operation of the navy department has been secured and it is believed that future trespasses on the island will be prevented.

The Educational Department of the Y.M.C.A. of Portland, Ore., will continue a series of agricultural lectures during the coming winter. This has been a regular custom with this or- apple growers of the Hood River Valganization for many years. "The ley" will be the first topic discussed.

CULTURE OF PAPAYA.

The Department of Public Instruction of the Philippine Bureau of Agriculture has issued the following cultural directions for papaya, written by P. J. Webster, Horticulturist:

Seed Bed.

The seed bed should be prepared by thoroughly pulverizing the soil by spading or hoeing the ground well, and the clearing away of all weeds and trash. Sow the seed thinly, about one to two centimeters apart, and cover the seed not more than one centimeter with soil, then water the bed thoroughly. In the dry season it is well to make the seed bed where it is shaded from the hot midday rays of the sun, under a tree; or it may be shaded by the erection of a small bamboo frame on the top of which are placed grass or palm leaves. If the seed is planted during the rainy season, a shed of palm leaves should always be put up over the seed bed to protect the seed from being washed out and the plants from being beaten down by the heavy rains.

Transplanting.

When the plants have attained a height of about seven to ten centimeters, they are ready to be transplanted to the place where they are intended to grow.

Unless the transplanting has been preceded by a good rain, the plants should be thoroughly watered before they are removed from the seed bed. In order to reduce the evaporation of water from the plants until they are well established in their new quarters, about three-fourths of the leaf blades should be trimmed off.

In transplanting, take up the plants with so large a ball of earth that as few plants are cut or disturbed as possible. Do not set out the young plant deeper in the new place than if it grew in the nursery; firm the soil well around the roots, making a slight depression around the plant, and water it thoroughly.

In order to protect the tender plant from the sun until it is established, it is well to place around it a few leafy twigs at the time of planting. It is well to set out three plants to each hill, and as the plants grow up and fruit, to dig out the males or the two poorest fruiting plants.

If the plants cannot be set out in the field at the time indicated, transplant them from the seed bed to a nursery, setting out the plants about twenty to thirty centimeters apart in rows a meter apart, or more, to suit the convenience of the planter. While the best plan is to set out the plants in the field before they are more than thirty centimeters tall, the plants may be transplanted to the field from the nursery with safety after they are more than 1.5 meters high, provided that all except young and tender leaf-blades are removed, leaving the entire petiole, or leafstalk, attached to the plant; if the petiole be cut close to the main stem, decay rapidly enters it. If the entire petiole is left, it withers and drops, and a good leaf scar has formed before the fungi have had time to work their way from the petiole into the stem of the plant.

Treatment of Old Plants.

When a plant has grown so tall that it is difficult to gather the fruit, which also at this time grows small, cut off the trunk about seventy-five centimeters above the ground. A number of buds will then sprout from the stump and will form several trunks that will bear fruit like the mother plant in a short time. These sprouts, except two or three, should be cut off, for if permitted to grow the fruit produced will be small.

Seed Selection.

Seed should be saved from the best fruits only. By this is meant not so much a large fruit as one that is sweet and well flavored, with a small seed cavity and few seeds; oblong fruits should be preferred to roundish ones in saving seed, as they grow on plants having both stamens and pistils in the same flower, and these being, very largely, self pollinated, the seeds produced from such flowers are more likely to reproduce their kind than the

General Agriculture

SOME FACTS ABOUT PARCELS POST.

We shall not get clear ideas on the subject of parcels post until we study the methods by which packages of eleven pounds or less are handled. In our country the express companies have a monopoly of this business; in fact, a monopoly of carrying packages weighing over four pounds. It must not be forgotten that we have parcels post. We have had it for many years, but it is limited to a four-pound package, and the rate is sixteen cents a pound. No other country of which we have any knowledge has a parcels post of this limited character and high cost.

In Other Countries.

In European countries the general weight is eleven pounds, with certain regulations as to size. It may be interesting to study rates in some other countries. The highest foreign rate is in Cuba, where the cost is 10 cents up to five pounds and 6 cents for each additional pound. It may be said that Cuba is a small country. So it is; but Australia is a large country. There are six states in it. Its intra-state rate is 12 cents for one pound, 18 cents for two, 24 cents for three, and 6 cents for each additional pound up to and including eleven pounds, the parcels rate for this being 72 cents. The inter-state rate is 16 cents for one pound, 28 cents for two, $1.36 for eleven pounds. The population of Australasia is only one-tenth as dense as that of the United States.

We Oblige Others.

The most striking feature of the present situation is that the United States has postal treaties with twelve countries or parts of countries in Europe, nine in South America, seven in Asia, three in Africa, five in Canada, and with nine groups of islands, and you can send packages up to eleven pounds to any postoffice in any of the above mentioned countries at 12 cents a pound; while our parcels post rate is 16 cents a pound for any distance, and limits the size to four pounds. In other words, a Jap in Omaha can send a package to Japan at 12 cents a pound, while an American in the same city would have to pay 16 cents a pound to send a package to Lincoln. An eleven pound package would cost $1.32 to Japan, but $1.75 to Des Moines—and to send it by mail to Des Moines it would be necessary to make it up in three packages.

Another surprising fact is that the express companies are under contract with the postoffice department of Great Britain to carry an eleven-pound package even clear across the United States for 25 cents, whereas they would charge an American citizen somewhere around three dollars for carrying the same package from New York to Seattle.

Another Fact.

In Europe, where they have parcels post, they have no express companies. The railroads transport all packages above eleven pounds, and do it quite as satisfactorily and at much less relative cost than our express companies here do the business.

It should soak into the minds of both the railroad people and the citizen, that the express companies are simply parasites on the railroad business, and indirectly one of the reasons for the plea for advanced rates on the part of the railroads. A lousy calf or pig must have more feed, if it is to thrive, than one that is clean, so much of the nutriment of the feed goes to the louse. So the railroad that is supporting an express company must either have higher rates or give poorer service. The louse thrives whether the calf does or not. That the express companies are thriving is evident from the fact that the Wells-Fargo Company, as shown by recent investigation, earns a profit of about 70.7 per cent on its capital, largely water. The actual profit on the capital that is really invested in the business of the American Express Company is 105.6 per cent.

Why?

Our readers can easily guess why the railroads submit to this parasitism. It will probably be found on investigation that the men who really own the railroads are heavy stockholders in the express companies. The common stockholder may lose by reason of a lousy railroad, but the men who own the express company fatten by the process.

It is worth while looking into the relations between the railroads and the express companies. The railroad has a contract with the express company. The louse has no contract with with the pig or calf. This contract generally provides that the express company pay to the railroad about 50 per cent of its gross earnings—to be accurate, 47.7 per cent. In other words, the express companies get about half of the total earnings for collecting and distributing the express packages hauled by the railroads. The rate charged, according to the testimony of express company officials, is about two and a half times the first-class freight rates on the same class of goods to the same point. In many cases, however, investigation shows that they are from three to five times these rates. The express rates are supposed to be based on the rate for 100 pounds. When the rates are attacked, the companies simply reduce the minimum, and in this way have been able to advance their rates very materially during the last ten years.

More Discrimination.

When a strike occurs among the express employes, as recently in New York, the whole express business of the country is demoralized, involving very heavy losses to merchants and farmers; while parcels post packages coming by mail from other countries were delivered promptly. In this, as in so many other ways, the people of the United States treat citizens of foreign countries better than their own.

Whenever anything is said in favor of parcels post, the bogie that is brought up to alarm the merchant is the mail order house. This bogie will cease altogether to be a bogie when we realize that no country that has parcels post is bothered by catalogue or mail order houses, or at least we hear of no complaint about them.

We studied this parcels post question pretty thoroughly when on the Country Life Commission, took testimony all over the United States, and we came to the conclusion then that somebody was putting up a large amount of money to defeat parcels post, and making use of it in the way of organizing the country merchants against this movement. Who it is we are not prepared to say, or at least prove.

When writing advertisers, mention Cultivator

We are clearly of the opinion that parcels post would do the mail order houses more damage than any other interest except the express companies, especially the liimted parcels post proposed by the postmaster general under the Roosevelt administration. By this it was proposed to distribute parcels at a very low rate through the rural carriers on the various routes emanating from a town.

This would enable farmers to order packages from the town merchant without the trouble of hitching up and going to town, at an expense probably less than the trouble of hitching up and the wear and tear on team and wagon. The mail order house could not possibly utilize this, and the result would be that the business of the farmer would be thrown directly to the nearest town or city from which his rural route issues. It might possibly change the method of doing business in the country towns, might eliminate some of the local merchants, which would be a good thing, for the reason that in many towns and cities there are more retailers than can make a decent living without charging exorbitant prices.

The cry will be made that it would swamp the rural carriers. There are forty thousand of these, and the official reports say that the average weight of mail delivered by each wagon in the rural delivery service is only twenty-five pounds. The carrier is prepared to take 500 pounds. Now if by this limited parcels post the rural routes earn two dollars for each round trip, the gain would be over $2,500,000; and to make this gain each carrier would only need to take twenty pounds additional, or a total load of forty-five pounds.

Rural parcels post—and we believe this should be tried out first on the plan proposed by Postmaster General von Meyer—would enlarge the scope of our present parcels post by raising the limit from four pounds to eleven, and greatly reduce the rate. It would strike down the monopoly which the express companies now have in transporting everything weighing more than four pounds; but mainly, it would induce the farmer to deal with his country merchant at a very greatly reduced cost.

The rural mail delivery and the rural telephone have been a wonderful advantage to the farmers of our land; and parcels post would be as great an advantage in many ways as either of these. It would not have been practicable until the rural route system was established and the telephone brought into use. It now follows logically as the third great addition to the comforts of the farm home.

It is time for the farmer to let his representatives in congress know that he wants them to do business on this matter without any more foolishness. —Rural New Yorker.

* * *

Here is a copy of the Sulzer bill, the passage of which will be pressed at the coming congress. Its passage means greatly reduced postal rates, and allows parcels up to eleven pounds. It also means other improvements in the postal service, and, we trust, the placing of the service on a more businesslike basis. The bill and the petition below are put in this form in the Cultivator that it may be cut out and pasted on the ordinary legal cap paper and used as a heading for a petition which we hope our subscribers will circulate and send to Washington. We believe the best method will be to send to the representative of the district in which the petition is circulated.

Postal Progress League Bill, H. R. 14

Introduced in 62nd Congress, April 4th, 1911, by Hon. William Sulzer of New York

A BILL—To Reduce Postal Rates, to Improve the Postal Service and to Increase Postal Revenues

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled. That the common weight limit of the domestic postal service of the United States is hereby increased to ELEVEN POUNDS, the common limit of the Universal Postal Union, and that in the general business of the post office the one-cent-an-ounce rate on general merchandise—fourth-class mail matetr—be, and is hereby, reduced to the third-class rate, one cent for each two ounces or fraction thereof.

Sec 2. That the rate on local letters or sealed parcels posted for delivery within the free-delivery service is hereby determined at two cents on parcels up to four ounces, one cent on each additional two ounces; at non-delivery offices, one cent for each two ounces.

FREE RURAL SERVICE.

Sec. 3. That all mail matter collected and delivered within the different rural routes of the United States is hereby determined to be in one class with rates, door to door, between the different houses and places of business and the post office or post offices on each route, as follows: On parcels up to one twenty-fourth of a cubic foot, or one by six by twelve inches in dimensions and up to one pound in weight, one cent; on larger parcels up to one-half a cubic foot, or six by twelve by twelve inches in dimensions and up to eleven pounds in weight, five cents; on larger parcels up to one cubic foot, six by twelve by twenty-four inches in dimensions and up to twenty-five pounds in weight, ten cents. No parcel shall be over six feet in length, and in no case shall a carrier be obliged to transport a load of over five hundred pounds.

INSURANCE.

Sec. 4. That on all unregistered prepaid mail matter without declared value an indemnity up to ten dollars shall be paid by the Post Office Department for such actual loss or damage as may occur through the fault of the postal service, and this without extra charge. Certificates of posting shall be provided on demand. On registered parcels of declared value, and on which the fee for registration, insurance, and postage has been duly prepaid, the Post Office Department shall pay the full value of any direct loss or damage that may occur through the fault of the postal service. The fees for insurance and registration shall be as follows: For registration and insurance up to fifty dollars, ten cents; for each additional fifty dollars, two cents. No claim for compensation will be admitted if not presented within one year after the parcel is posted.

Sec. 5. That all Acts and parts of Acts inconsistent with this Act are hereby repealed.

Sec. 6. That this Act shall take effect six months from and after the date of approval thereof.

(THE ENTERING WEDGE FOR A LOWER RATE AND A GREATER CARRYING CAPACITY.)

General Service—Weight Limit, 11 lbs. Rate, 8c per lb. Rural Service—Weight Limit 25 lbs.... Rate, 1 lb. 1c; 11 lbs. 5c; 25 lbs. 10c. Insurance to full value.

PARCELS POST PETITION

To the Hon. Senate and House of Representatives of the United States of America, assembled in the Sixty-Second Congress:

Gentlemen:—

We the undersigned, respectfully request the immediate enactment of the above bill or of a more progressive measure into law.

Date.....

LILLY'S SEEDS

These 3 Vegetables for 10 Cents

This is not a bargain, but an introductory offer to get you interested in Lilly's Seeds, and to prove to you their quality and reliability.

LILLY'S "DELICIOUS" LETTUCE. A variety introduced by us, very early with fine, hard, medium-sized heads, rich yellow heart, with a delicious buttery flavor.

LILLY'S "EARLIEST OF ALL" RADISH. A very small, round, bright red radish with white, crisp flesh of a delicious, mild flavor. An excellent variety for cold frame.

LILLY'S "NEW WHITE QUEEN" ONION. A very early, small, round variety of fine, crisp flesh, with a deliciously mild flavor. A great favorite for the home garden, easily grown and matured.

The above three varieties are all regular 10 cent packages. We offer the three for 10 cents to introduce. Send money order or stamps.

Small Fruits and Vegetables

THIS MONTH IN SOUTHERN CALIFORNIA.

By O. M. Morris.

This month is the season for general garden and is to be considered our only winter month—if one could call it so owing to the chilly nights. Most everything planted now grows slowly except in very favored localities. Under such conditions plantings are being made of all the hardier vegetables. Some kinds of these are planted with good results. Turnips and cabbage are quite hardy and can be planted now. We might also add carrots, beets, lettuce, peas, kale, Swiss chard, radish, leek, mustard, collards, onions and Brussels sprouts. Also if one wants early greens small plantings should be made every ten days or two weeks of China cabbage. This makes very early greens, but soon goes to seed. So it is necessary to plant along through the season—up till April. It will not do very well in the hot summer months. This also makes an excellent quick feed for chickens and during winter is probably better than Swiss chard, the latter being of slow growth during winter. Another good vegetable greens is pepper grass or cress. This does well during the cooler months, should be planted under same culture as radish or carrots. This is very common in Europe, but not much known here. They use it generally to mix with other greens to impart its tart spicy flavor. This mixed with spinach makes a splendid dish. Spinach is nearly always in season, especially during cooler months, and one should use the winter varieties now. They make quick growth and are ready in about sixty days from planting, and like China cabbage, should be planted at frequent intervals so as to keep a good young crop coming along as needed.

The Los Angeles market is well supplied with an extra fine quality of lettuce this season, also in most other lines of vegetables. The quantity is far superior to former years. This is owing to intelligence in selecting varieties that succeed in this climate for a particular season. Our vegetable growers are becoming educated fast along these lines, and consequently they are making good profit from their investment and labor. It would be very profitable for any one interested in these matters to visit our Los Angeles markets during the very early hours of the morning and see what great quantities of vegetables are handled and also interesting to see how they are disposed of. There is probably less than 15 per cent of the product sold retail by the peddlers that is raised by them, the growers bringing into the markets their big wagonloads, and selling to the peddlers what they need, and they in turn scatter out over the large area of the city and sell their supply to the housewife. There are many hundreds of these peddlers, and their hours of labor are long ones. They are at the market long before it is light and many do not get back home till late at night. This is one reason that the growers find it more profitable to sell wholesale and get back home early to look after their work.

The tree planting season is now close at hand. January 1st will start the season. Fruit trees are in big demand and supply is limited. Apricots are about cleaned up at this date under contract for future delivery. Apples are also finding ready sale under contract. Large orchards are to be planted, and these promise a short supply for later delivery, and prices will probably be a little stiffer than for several years. The many new sections of the country coming under cultivation are calling for a larger supply. Also as deciduous fruit tree planting has not kept up with the demand for the fruit of late years, the orange having held the interest of the horticulturalist. But the price of deciduous fruits for several years has been on the increase in the South and much planting is contemplated.

THIS MONTH IN NORTHERN CALIFORNIA.

By R. E. Shouse, Willows.

In Northern California I do not think December too late to begin a winter planting of all the hardy vegetables, such as turnips, beets, carrots, lettuce, parsnips, onions and radishes. To this list may be added, if the plants have been started, cabbage, cauliflower and celery, which can still be set out to good advantage.

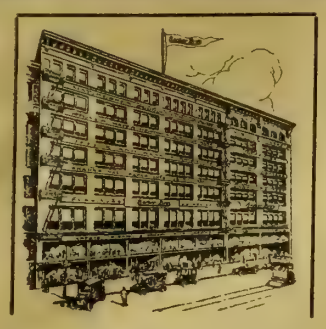
To prepare the soil for a winter garden, special pains should be taken to work in plenty of light stable manure. If possible, field peas, or vetch, should be grown and plowed under green. This will make the soil light and easy to cultivate. Be sure to provide also for thorough drainage. Cultivate the crops in the usual way. Keep the soil well drawn up around the celery. This will keep it white. Celery must not stand in water, as this would cause rust and it would not sell to advantage.

It is a little late now to plant green manure in your orchard. This should have been attended to about two or three weeks ago. Vetch is usually planted in the fall, in the latter part of October, and plowed under early in the spring. Then cow peas can be planted and plowed under in the fall. This is wonderful help in an orchard, either old or young. If no green manure has been turned under this fall it would be well to take stable manure and place it around the tree in a circle about ten feet in diameter and spade it as deep as is possible without disturbing the roots.

If any transplanting is to be done it could be done now. The hole where the tree is to stand should be made ready and the tree should be well cut back before being lifted out of the ground.

Later in the month, when the work is slack on the farm, you can start pruning. This is a very particular piece of work, but there are some who do not realize this fact. Pruning does not mean to cut off a few branches without knowing just why it is done. A pruner should be able, if asked, to tell his object in cutting off each branch, and what good it will do the tree. It would not be advisable to follow any set rule for pruning, as each tree may need attention of a different sort. Young trees, such as apples, cherries, plums, apricots, and peaches, should have the leader cut to about three-quarters of its height and the laterals should be cut back to three or four buds when the tree is planted. The second year the trees can stand a more severe pruning. Cut well back, but remember that you are starting the framework for a well-shaped tree.

Pruning of old orchards will be explained later.



—Largest Household Piano, and Office Equipment House in The United States.

—Goods Carefully Packed and Shipped Promptly to any Point—It Will Pay to Buy of Us if You Live Anywhere West of the Rocky Mountains.

—Write us if you cannot visit our store in person. Our Mail Order Department will furnish prices on anything you may need in the home-furnishing line.

—We have in our immense establishment the largest and most satisfactory stock of household furnishings ever shown under one roof in America. The Ornamental Garden

THIS MONTH IN NORTHERN CALIFORNIA.

By R. E. Shouse, Willows.

Early in December fruit growers in the Sacramento Valley should start pruning all deciduous shrubs and trees. The rose should be cut back so as to leave three or four buds of this year's growth and all dead branches, or cross branches, should be removed. Be careful to cut away any suckers that may appear below the graft. Transplanting deciduous trees and shrubs can be done at this time.

If specimen plants, or single plants that are to stand by themselves, are to be set out, dig a hole at least one foot more in diameter than the space occupied by the roots and about one foot deeper than the roots will extend when in the ground. When the soil is taken from the hole it should be thoroughly mixed with well-rotted stable manure. After the plant has been set in place the soil should be settled around the roots with water.

Trees and shrubs that are to be transplanted should be well-pruned back and all the dead wood should be carefully removed. The prunings can be made into cuttings and packed in damp sand until they start to grow. When this growth starts they should be transplanted to rows and later to the permanent bed.

This is just a little too early to begin to build hot beds; still, I think that if proper care is taken they can be started now with good results. Select a spot sheltered from the wind as the place to start your hot bed. Here you can start all your hardwood cuttings, your geraniums and tuberous rooted Begonias, and seed of almost every annual and perennial that can be planted. This hot bed should contain fresh manure to the depth of about 18 inches, with about 6 inches of sandy soil on top. The bed is simply a box and should be made of 2-inch material. The sash is usually 6 feet by 4. The top of the sand when the hot bed is finished should be about one foot below the level of the ground. Build the bed and put in the soil at least one week before you are ready to do the planting. This gives the soil a chance to become warm. Plant the seeds and cuttings in rows, and be very careful to keep an even temperature in the bed.

When the hardwood cuttings have started to grow they may be set out in rows in the field, thus making more room in the hotbed for more tender plants. The seeds when up about one-half, or three-quarters of an inch in the hotbed, should be thinned so that they will be about two inches apart. The geraniums and begonias when well rooted, should be transplanted into 3-inch pots. This will give you an early start for spring and summer flowers.

HISTORY OF A FLOWER.

Flower lovers may be interested to learn that a flower from the first chrysanthemum ever grown in England may still be seen in the herbarium of the British Museum. The plant, one of the small yellow-flowered variety, was introduced into the Chelsea botanic gardens in 1764, by the famous floriculturist Philip Miller, who himself preserved the specimen now in the museum. The new flower, however, failed to "catch on." Its culture was neglected, and it is only within recent years that it has attained its present enormous popularity. — Westminster Gazette.

THIS MONTH IN SOUTHERN CALIFORNIA.

By O. M. Morris.

This is the season that one should be making ready for the early garden. Sweet peas should now be planted, the earlier the better. Field-grown roses will be ready for planting out within the next two or three weeks, and for spring blooming the earlier they are planted the more flowers one can expect. The field-grown rose business has become of considerable importance to Southern California. We have a dozen or more firms that grow them in large quantities. Three firms estimate their supply away over one million plants, and they are shipped all over the United States. Large quantities are shipped to Oregon and Washington and car shipments have gone to the Middle West and even as far as New Jersey. One can get better rose plants in California than anywhere and there is no excuse for having the small greenhouse plants sent in by mail from the East that seldom give satisfaction. These California roses can be secured in your own town or from some nurseryman near by, and will give good satisfaction, or can be had from the leading seedsmen.

Many varieties of flower seed can be planted now: Phlox, mignonette, forget-me-nots, sweet alyssum, centaureas, candy tuft, cosmos, snapdragon, dianthus, gypsophila, Hunnemanias, poppies, hollyhocks, flax, lupins, pentsemons, stocks, pansies, etc. These are all hardy and easily grown. The sowing broadcast of California wild flowers, or even the California poppy in vacant lots, on hill sides and waste places, should be more encouraged, as they look much better than having such places bare, or grown up with weeds.

Early flowering asters should be planted now under a form or cover. They should be ready to bed out in March and would give bloom in May and June, following this planting a month later with Giants comet and American branching and have the flowers nearly all summer. There is no single flower that is so fine for cutting or for the flower garden as the aster in its many classes, and they are universally admired. The newer classes are almost as large and fine as large Chrysanthemums and are cheaper and more easily grown. Every one should try the Giant comet and Giant American branching, and we might mention here that California seedsmen grow the principal supply for this country, and this has been accomplished during the last few years. One firm shipped East over two tons of seed the past season. Formerly this seed mostly came from Germany. But times have changed and now we grow a finer flower than they ever produced and seed is of higher germination.

We all know the delight of going back to an old home, searching out the flowers we remembered—the roses by the walk, the iris under the crab apple trees, the bed of phlox; how good it seems to find them all there! Let us begin making memories for our children by putting out perennial plants and shrubs for them to come back to; the flowers mother used to raise are a more pleasant topic for conversation than the pies, cakes, etc., mother used to make. It is always with pride that a man says: "My mother was a great hand for flowers." Flowers indicate refinement.

IMPROVEMENTS IN NATIONAL PARKS.

The Department of the Interior proposes to spend $381,620 in the national parks in California during the fiscal year ending June 30, 1913, if the amount requested by the Secretary of the Interior is appropriated by Congress. This is an increase of $314,070 over the appropriation for the current fiscal year. The increases requested are as follows: Yosemite National Park, from $50,000 to $274,000; Sequoia National Park, from $15,550 to $89,550; General Grant National Park, from $2000 to $17,250. The items for each park are as follows:

Yosemite National Park: New road along south rim of Yosemite Valley from Fort Monroe to Glacier Point, $75,000; improving the road on the north side of Merced River from Pohono bridge to the junction with the Coulterville road, $50,210; continuing the improvement of the road on the south side of Merced River from Camp Ahwanee to Happy Isles, $46,750; a reinforced concrete bridge to replace the Sentinel bridge over Merced River, $14,000; construction of trail from Merced River, $5000; construction of trail from the head of Lyell Fork Meadows to the Lyell Glacier, $1500; continuing the installation of the water-distributing system in the Yosemite Valley, $25,000; garbage incinerator, $6900; operating the present road-sprinkling system, $7500; the extension of the road-sprinkling system to Fort Monroe and Happy Isles and operation of the same, $7500; repair of existing roads, trails, bridges, culverts, buildings, plants, fences, camp sanitation, and removal of undergrowth, $25,000; salaries, $10,460.

Sequoia National Park: Widening 21 miles of Giant Forest wagon road to 18 feet and constructing drain culvert, $25,200; constructing 40 miles of trail, $12,000; improving 150 miles of trail, $15,000; construction of 20 miles of telephone line, $8000; fencing 50 miles of the park boundary, $10,000; completion of water system for Tourist Camp at Camp Sierra, including public drinking fountains, $2500; constructing a stairway and handrail on Moro Rock, $2500; construction of pier, bathhouse, and boathouse at Twin Lakes, $2000; improvement and development of Paradise and Clough caves, $2000; piping water from Log Creek to Military Camp, $2000; repainting Marble Fork bridge, $250; fencing rangers' pasture and constructing and painting rangers' cabins, $2400; salaries of rangers, $5700.

General Grant National Park: Construction of two miles of wagon road, $5000; construction of 2 miles of trail, $400; completing water supply system at Tourist Camp, $500; fencing Tourist Camp ground, $800; rebuilding 8 miles of park boundary fence, $1600; construction and improvement of park buildings, $1050; forestation and protection of growing forest, $5000; construction of three gateways at entrances to park, $750; construction of public bathhouse, $750; salary of park ranger, $1400.

For the development and care of the national parks the Secretary of the Interior has asked Congress to appropriate the sum of $791,080.60, an increase of $617,830.61 over the appropriations for the current fiscal year. The national parks constitute ideal recreation grounds for thousands of people, but their development and use are seriously retarded by the lack of adequate roads and trails, and until sufficient money is appropriated for beginning a comprehensive plan of development the parks will fall far short of rendering the important public use for which they are intended. The general public interest in these pleasure grounds is shown by the fact that in a list recently issued by the Department of the Interior 390 magazine articles on the parks are enumerated. It is the intention of the department to make the principal places of interest in the parks accessible, to render traveling more comfortable by sprinkling the roads throughout the dry season, and to guard the health of the traveler by the installation of proper water supply and sewerage systems. The responsibility for the future conduct of the national parks must rest with congress, but the department feels that the financial needs of these reservations should be clearly presented to congress in the annual estimates.

THE COLORADO RIVER BASIN.

There is no more interesting river in the world than the Colorado. Industrially, scenically and geologically it presents more diverse conditions than any other stream in the United States. From the crest of the Rocky Mountains in Colorado and Wyoming it sweeps across the intervening country, traversing parts of Utah, New Mexico, Arizona and Nevada, to the head of the Gulf of California, the area drained being about 300,000 square miles. In the Rocky Mountain region it flows through a country covered by eternal snows and waters, some of the most fertile and valuable agricultural lands in the world, in Western Colorado, Northwestern New Mexico and Eastern Utah. It traverses the famous Grand Canyon of the Colorado in the northern part of Arizona, and finally passes over the broad, flat plains above the head of the Gulf of California. In this lowermost portion the river strongly resembles the Nile, having annual floods which distribute silt over the adjoining lands and render them as fertile as those in the historic valley of North Africa. The Colorado and its tributaries have other values than that of irrigation, for, descending in steep channels, they present abundant opportunities for the development of water power. Power has been developed at a few points, but the resources of the Colorado basin are in this respect yet practically untouched.

Prevent Disastrous Inundations.

In a basin so liberally provided with natural resources it is a fundamental necessity, in planning for the utilization of the river, to ascertain the amount of water available in the main stream and its principal tributaries, so that future developments, as well as those now under construction, can be suitably designed in type and capacity. For a long period of years the United States Geological Survey has been making observations and measurements at many important points in the Colorado basin, and the latest published information on the subject is contained in Water Supply Paper 269 of the Survey, which is a progress report of river flow measurements in this basin for the year 1909. In this report are recorded observations at

179 stations, covering Grand River and tributaries in Utah, Colorado and Wyoming, the San Juan basin in Northwestern New Mexico, the Little Colorado River basin in Colorado, the Gila River basin in Arizona, and finally the discharge near the mouth of the main stream at Yuma, Arizona. These records are not only of local value for guiding economic development, but they have an international significance in connection with the difficulties that have been encountered in the control of the Colorado near its mouth in Mexican territory. The escape of the river from its regular channel and its diversion in the Salton Sea are matters of recent history, and the consequences of a diversion of this kind, which promised to inundate some of the most fertile country in Southern California, have been discussed in the public press.

Controlling the River.

The control of the Colorado for the prevention of further outbreaks must involve thorough knwledge of the tributary flow, even in the high regions of its headwaters in Colorado, and the ultimate steps taken to prevent disastrous inundation will in all probability involve the control of these upland tributaries.

The size of the Colorado River is indicated by its total discharge in the year 1909, which was 26,000,000 acre feet, or enough water to cover that number of acres to a depth of one foot. Such an amount of water, if poured upon Manhatton Borough of the City of New York and confined by retaining walls, would bury the city 1,857 feet deep, or it would make a lake 66 feet deep over the state of Delaware.

A copy of Water Supply Paper 269 may be obtained on application to the Director of the Geological Survey, at Washington, D. C.

YELLOW PINE.

The Department of Agriculture will soon issue Forest Service Bulletin 101, on "Western Yellow Pine in Arizona and New Mexico." The bulletin goes into the history of this tree, showing its progress, its faults and virtues, how best to protect it against fire and other enemies, how to conserve its growth, and its commercial value.

Answering the question would it pay to practice forestry of yellow pines affirmatively, the bulletin adds: "Just how much it will pay will depend, of course, upon the conditions under which each individual operates. The lumbermans' chief loss is undoubtedly through fire. Therefore, it will pay him to protect his timber from fire, and to use reasonable precautions in his logging operations. To burn oil in his engines and to see that his steam skidders and donkey engines are provided with spark arresters may be the means of preventing great losses. Close utilization is wise from a financial standpoint, and dead timber is now being profitably used by one of the largest manufacturers in Arizona."

"Western yellow pine," the bulletin concludes, "does not reach the development attained on the Pacific Coast, yet it is a tree admirably adapted to the semiarid conditions of the region, and is capable of yielding excellent saw timber. It withstands disease well, and except in early life is not susceptible to fire, drought, frosts or snow. From 160 to 200 years are usually necessary to produce a sawlog. The better grades of lumber are excellent for finish. Lumbering in the Southwest is expensive chiefly on account of the high price of labor. The higher grades of timber are easily disposed of, but the lower ones are difficult to market. Nevertheless, the timber in the national forests in the Southwest offers excellent opportunities for investment."

SNOWFALL.

"During the last two years the Weather Bureau has made systematic measurements of the amount of snowfall in the mountain regions of the West for the purpose of determining as accurately as possible the amount of water available for agricultural and commercial interests during the ensuing spring and summer seasons." The above statement was made by Secretary of Agriculture Wilson.

Continuing, the Secretary said: "In connection with the study of snowfall and its consequent run off, a systematic snow survey was begun in the watershed of Maple Creek, near Springville, Utah. While the work was of an experimental nature, it is thought that within two years sufficient observations will have been obtained to permit of accurate forecasts of water supply from the winter snowfall. The system can also be extended to other and larger projects, and the work will be limited only by the amount of funds available for the purpose. The report on the preliminary campaign in the Maple Creek watershed has brought many expressions of commendation from farmers and hydraulic engineers."

THE WORLD'S OUTPUT.

The United States Department of Agriculture has received the following cablegram, dated November 18, 1911, from the International Institute of Agriculture, Rome, Italy, regarding areas and production, this year, of the crops specified in the principal producing countries of the northern hemisphere, and the conditions attending the sowing and germination of winter cereal crops in the northern hemisphere.

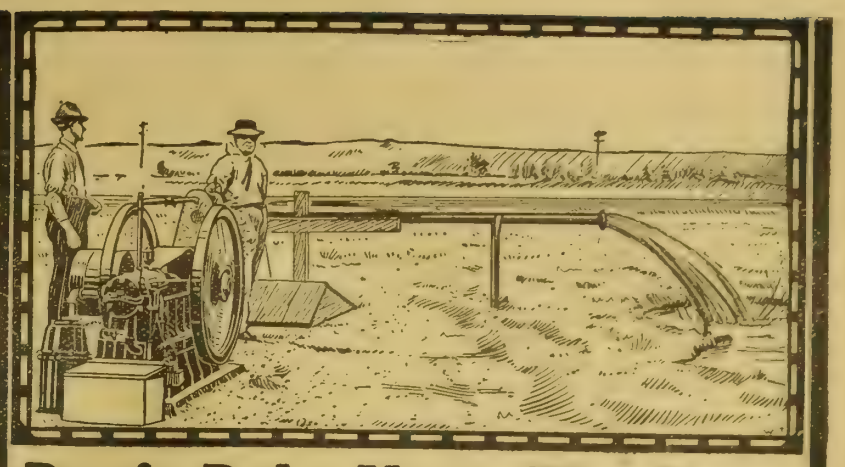
"All Wheat: Single numerical statemen of production 100.2 per cent of last year's production, indicating a total production of 1,637,000,000 cwt., or 3,055,733,000 bushels of 60 pounds.

"All Rye: 93.0 per cent of last year's production, indicating a total production of 662,000,000 cwt., or 1,324,000,000 bushels of 56 pounds.

"Barley: 99.4 per cent of last year's production, indicating a total production of 518,000,000 cwt., or 1,208,667,000 bushels of 48 pounds.

"Oats: 90.8 per cent of last year's production, indicating a total production of 967,000,000 cwt., or 3,384,500,000 bushels of 32 pounds.

"Winter Cereal Crops: The sowing is approaching completion; the work preparatory to sowing, and the sowing, was accomplished under good conditions, and germination is regular."



Don't Rely Upon The Rain

THE wise farmer takes no chances—he doesn't worry about the rain. He uses an I H C Gasoline Engine, pumps from a stream, lake, river, or well, gets all the water he wants, when and where he wants it. He's boss of the water supply—in absolute control. His profits are certain—he can bank on them.

I H C Gasoline Engines

are making and saving big money for farmers everywhere, every day. Why not for you? Besides being a perfect irrigation power, an I H C will do all other kinds of farm work, such as grinding feed, operating the clover huller, fodder cutter, saw, cider press, etc., more economically and dependably than any other engine.

Not only that, but in choosing an I H C you can select the engine best suited to your individual needs.

Vertical type—2, 3, 25, and 35-horse power; horizontal—1 to 50-horse power; semi-portable—1 to 8-horse power; portable—1 to 25-horse power; traction—12 to 45-horse power; sawing, pumping, spraying, grinding outfits, etc. Built to operate on gas, gasoline, kerosene, distillate, or alcohol—air-cooled or water-cooled. See the I H C local dealer, or, write nearest branch house today for our new catalogue.

WESTERN BRANCH HOUSES: Denver, Col.; Helena, Mont.; Portland, Ore.; Spokane, Wash.; Salt Lake City, Utah; San Francisco, Cal.

International Harvester Company of America

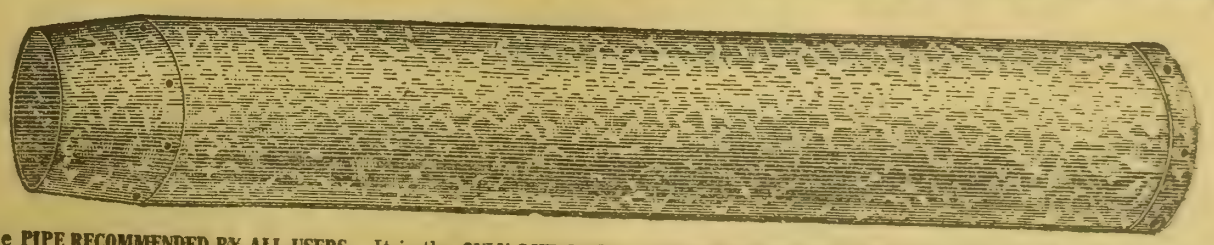
Save Money By Buying This Good Second-Hand Pipe

We can supply you with any size and quantity of Standard Pipe or Casing—all new threads and couplings—all stock guaranteed first-class.

If thinking of buying any kind of pipe, your best interests will be served by writing us for prices and particulars.

PACIFIC PIPE CO., Main and Howard Streets, SAN FRANCISCO.

SAVE YOUR TIME WATER and GRADING BY IRRIGATING WITH AMERICAN SURFACE IRRIGATION PIPE



The PIPE RECOMMENDED BY ALL USERS. It is the ONLY SCIENTIFICALLY CONSTRUCTED SURFACE IRRIGATION PIPE on the market. THERE'S NO ROUND SEAMS TO LEAK, retard the flow of water or weaken the pipe. This pipe is easily handled and cheaper than flumes. It will last a life-time. For irrigating alfalfa it is the only pipe to use. We make RIVETED PIPE AND TANKS. Write for Illustrated Catalogue, also SPECIAL IRRIGATION FOLDER which may mean much to you.

CONTENTS THIS WEEK

PICKING ORANGES IN BUTTE COUNTY, Cover.

ADVANCE OF DENMARK UNDER CO-OPERATION, 577.

CITRUS AND TROPICAL FRUITS.—Splitting of Oranges; Black Rot of Natal Citrus Fruits; 578, 579.

DECIDUOUS FRUITS AND THEIR CULTURE.—Spray for Black Spot Canker; Tumbling Mustard; Bird Investigations; Culture of Papaya; 580, 581.

GENERAL AGRICULTURE.—Some Facts About Parcels Post; 582, 583.

SMALL FRUITS AND VEGETABLES.—This Month in Southern California; This Month in Northern California; 584.

ORNAMENTAL GARDEN.—This Month in Northern California; This Month in Southern California; History of a Flower; 585.

IRRIGATION AND FORESTRY.—Improvement in National Parks; Colorado River Basin; Yellow Pine; Snowfall; World's Output; 586, 587.

EDITORIAL.—Valuable Wheats; Peach Borer; American Breeders; Angora Venison; More Co-operation; Country Life Committee; Buying Abroad; Parcels Post; Burbank in the Cabinet; Wilsonizing; Careless Work; Soil Testing; 588.

AGRICULTURAL NEWS NOTES OF THE PACIFIC COAST.—Northern; Central; Southern; The Coast; 589.

PROFIT IN THE POULTRY YARD.—State Poultry Work; Poultry Notes; Raising Turkeys; Scientific Feeding for Eggs; Infertile Eggs Keep Best; 594, 595, 596.

LIVE STOCK AND DAIRY.—Cleanliness; Signs and Habits of Health in Horses; 590, 591, 592.

VETERINARY.—Thrush; Tail Rubbing; 592.

QUESTIONS AND ANSWERS.—Cotton Seed Meal; Fumigating; Divorce; Productiveness of Oranges; Wistaria; Pruning of Apricots; Olive Cuttings; Dynamiting Vineyards; Muscatel; Eucalyptus Oil; Pecans; Nitrate of Soda; Trespassing Chickens; Chick Feed; Red Apples; The Feed Problem; Chicken Pox; Gangreen of Ovaries; Roup—Wrong Ventilation; How Much Food; 598, 599, 600.

HOUSEHOLD.—Wet Weather Talk; Along the Perilous Way; Useful Helps; Paper Bag Cookery; 601, 602, 603.

PRODUCE MARKET.—Los Angeles Market; San Francisco Market; Deciduous Market; Citrus Market; 604, 605.

VALUABLE WHEATS

Professor Shaw is sending out circular No. 71, "Grains Recommended for Trial." It refers to wheats which the Experiment Station has been testing out for several years. These new grains have not all as yet been pedigreed, but many of them are being disseminated in hundred-pound lots from the University Farm at Davis.

PEACH BORER

"The California Peach Borer" is the title of Bulletin No. 97 issued by the Bureau of Entomology, Department of Agricluture, and is written by Mr. Dudley Moulton, San Jose. It treats of the food plants liked best by this pest and descriptions and seasonal history, its natural enemies and methods of control.

AMERICAN BREEDERS

The eighth annual meeting of the American Breeders Association will be held in Washington, D. C., December 28, 29, 30. Mr. W. M. Hayes, Assistant Secretary of Agriculture, is secretary of this organization, and some of the brightest minds in the United States who have studied the question of plant and animal breeding will participate in the discussions.

ANGORA VENISON

The Angora Goat Breeders are planning a grand feed for January 4th, when a venison banquet is scheduled at the state meeting of the Oregon Angora Breeders. Proof is to be made that "Angora Venison" is one of the most palatable and is a poor man's relief in these days of high prices. At the Angora Show to be held at the same time, $1200 will be distributed in premiums.

MORE CO-OPERATION

We are glad indeed to see the deciduous fruit growers of the North get in line with the new Deciduous Fruit Growers League. This league will handle the larger problems of fruit marketing, such as transportation, tariff, credits and some other factors. J. W. Jeffery, former Horticultural Commissioner, is in charge. Mr. Jeffery has been a consistent believer in co-operation all his life and we believe will make a success of this league.

COUNTRY LIFE COMMITTEE

The California Country Life Committee has issued invitation for delegates to a Country Life Conference, to be held in joint session with the California Teachers' Conference, Bay section. The meeting will be at Stockton, Dec. 28-29. The special topic discussed will be "Rural Schools and Conservation." The basis of representation by delegates will be practically the same as at the October conference held at Davis. The number of teachers attending the conference may aggregate two or three thousand. At least there are three thousand members and it is estimated that the greater number will be present.

BUYING ABROAD

The United States sends to foreign countries one hundred million dollars worth of agricultural implements, and imports about fifty million dollars worth of foreign products which are used on American farms. In the latter are seeds, fertilizers, and of course a few farm implements, though in the line of manufactures the U. S. importation is very light.

Amongst the exports, twenty million dollars is for mowers and reapers, eight million for plows and cultivators and two and one-half million for threshers. The remainder is for miscellaneous tools and implements. Of her imports eighteen million dollars is for potash, guano and manure salts and seventeen million for nitrate of soda. Animals for breeding purposes, chiefly horses, are imported to the extent of three million dollars and for clover seed we send another three million, and for sugar beet seed nearly another million.

PARCELS POST

On another page will be seen a head for a petition which our subscriber may well take an interest in and use, to the end that we may secure a more business-like management of the postal department. Some Congressmen have felt that the department could be placed upon a self-sustaining basis by restricting its business. Usually business houses take the opposite view and meet increased expenses by inducing increased business. Surely no business house could continue as does the postal department, with a deficit every year. Of course it is claimed by the express companies that parcels post will result in still greater deficit in the department. It may under political methods, but if business methods are adopted there is no reason why the postal department of the United States should not be a profit bringer instead of a hard loser. Sign the petition and get your neighbor to do the same, and send it to your member of Congress.

BURBANK IN THE CABINET

We have a communication from a newspaper correspondent of Maryland in which he urges the fitness of Luther Burbank for the position of Secretary of Agriculture. Regardless of Mr. Burbank's fitness for this particular responsibility, he is worth too much to the horticultural world in the position he now occupies and in his wonderful talent for the creation of new forms of plant life to be taken away from that work which may bless mankind for all time to come. The same correspondent says: "Mr. Burbank believes with me that the public schools are not what they should be." Perhaps this is true, for doubtless the schools have not reached the stage of perfection, neither will they in the near future, but when he charges that public school education "does make boys idlers, discontents and criminals," we are sure he is not within the bounds of the truth and equally sure that Mr. Burbank does not agree with him in any sense.

Sure it is we want a change in the cabinet. Mr. Wilson has served well and long. He has not "outstayed his welcome," but plainly the people the country over are getting ready to extend to him a hearty welcome to private life.

WILSONIZING

We note that many of the circular letters of information sent to the press from the office of the Department of Agriculture at Washington state that "Secretary Wilson says," "Secretary Wilson thinks," "Secretary Wilson does" certain things. This is comparatively new. The Department of Agriculture represents the greatest productive industry in this country and the people who follow it, and the accomplishments of the Department are watched with great interest, resulting in much profit to the country and to the producers. It is right that it should have the credit for the great services its faithful workers are rendering, but while effort to give undue credit to the one whose name happens to head the list may be a source of satisfaction to that individual, we do not think it tends to encourage more efficient work on the part of those who are responsible for the accomplishments of the department.

Secretary Wilson has given long and faithful service to the Department. All credit is due him for much effective work, but, frankly, we do not like the new method of everlastingly Wilsonizing the information sent out.

CARELESS WORK

The Oregon Agricultural College is taking exception to certain reports of lectures delivered before the Portland Y. M. C. A. That organization is progressive, and one of its aids to young men desiring the latest along agricultural or fruit growing instruction has been the securing of lecturers who have appeared before the young men and given much valuable information. This was deemed too valuable to be wasted, so the Y. M. C. A. had short-hand reports made and later the lectures published in booklet form. The editing of these reports was placed in the hands of some one apparently uninformed on agricultural subjects and so garbled as to be worse than useless, for many wrong impressions are conveyed. The professors quoted are rebelling and in a statement which they have sent out some sentences in the book are quoted to show its hopeless inaccuracy. On one page of the booklet are seven serious errors. The statement is printed: "We find the soil of the Umatilla Valley will grow better pears than any other soil." This the lecturer "quoted" asserts he never said, for the soil of the Umatilla Valley has never yet been tested for pears and the impression is that it is not adapted to their culture. "Silt and sandy loam along the rivers," becomes in the hands of the reporter, "Silver sands lean along the river." Such a publication should be recalled.

SOIL TESTING

We have a letter from Dr. Cyril G. Hopkins of the University of Illinois, in which he refers to a soil testing outfit being advertised from a small Ohio town. The outfit is offered at ten dollars, one of its features being "The Story of the Soil," written by Dr. Hopkins, supposedly as an added inducement to the purchaser.

Regarding the outfit Dr. Hopkins writes: "I wish to say that I knew nothing of the Foote Farm Laboratories until we began to receive inquiries from their advertisements. We at once ordered an outfit, including all instructions, and have thoroughly investigated the outfit and the methods by which the Foote Farm Laboratories claim any farmer can analyze his soil,—the following quotation being a sample of their advertising:

"'The Foote Soil Testing Outfit is a complete, practical farm equipment with which you can readily tell what plant food each one of your fields needs and what they already have. It tells you just what food elements are in your soil and what is lacking.'

"A thorough investigation of this outfit reveals the fact that it is absolutely worthless. The so-called directions for testing soil not only give no valuable information, but they are absurd and senseless. The farmer who pays $10 for the outfit and attempts to use it will have thrown away both his time and money. I make this statement because my name is being used in a way to mislead."

Agricultural News Notes of the Pacific Coast

Northern California

Eldorado County is shipping winter pears to England.

It has been decided to install a new creamery at McArthur, Shasta County.

Olives of Butte County are two weeks later in ripening than last year.

A hail storm visited Butte County last week and did some injury to maturing olives.

Thousands of turkeys are being shipped from Vina, Tehama County, for the holiday trade.

Work will begin in a few days on a big reclamation project near Suisun, mostly marsh land.

Several carload exhibits of oranges are displayed at the Oroville Citrus Show now being held.

The creamery at Susanville, Lassen County, has been closed again owing to the scarcity of cream.

Fruit growers of Sutter County are busy with their pruning. The present outlook indicates a big crop.

Twelve thousand acres of sheep pasture in Shasta County is to be brought under irrigation and subdivided.

The Citrus Exposition at Oroville is showing the largest display of olive products ever made in the state.

Hundreds of head of cattle are being driven down from the mountains of Shasta County to winter pasturage.

A broom corn grower at Corning, Tehama County, recently shipped two cars which he grew during the past season.

In spite of the dry fall, growers about Vacaville report fruit buds well advanced and in unusually healthy condition.

One buyer of broom corn in the northern end of the state has asserted that he could handle 500 cars if it could be produced.

A ton of dynamite to be used for digging irrigation and drainage ditches, has been ordered by the Sacramento Valley Irrigation Company on its big project in Colusa and Glenn Counties.

A new forage and pasture grass will be tried out this season by the agricultural department of the Sacramento Valley Irrigation Company. This is chicory, which is in extensive use by the farmers of England and Scotland.

It is reported that Philadelphia tobacco dealers have offered four cents a pound to Chico growers for peach culls to be used in flavoring tobacco. Eleven tons of culls were recently shipped for this purpose.

A delegation of bean bag manufacturers has protested to Governor Johnson against bean bags being manufactured at San Quentin. Only recently by request of the bean growers, Gov. Johnson gave the order for the manufacture of the bags.

Belgian horse owners of Walnut Creek, Contra Costa County, have formed an association to promote breeding of good draft horses. A. P. Borges of Moraga Valley has been elected president, and Armand Stow of Walnut Creek, secretary.

The boosters of Butte County are indignant because of a claimed discrimination by the demonstration train service in favor of the western side of the Valley. It is asserted that the exhibit of soil samples on the train did not do justice to the eastern side.

Central California

Mulefoot hogs is the newest introduction to Turlock, Stanislaus County.

The olive crop around Lindsay, Tulare County, is exceptionally good this year.

Tulare County has increased its olive acreage during the past season by some 400 acres.

Commissioner Schulz of Tulare County finds that red spider is infesting the shade trees.

An effort is on foot in Kings and Tulare Counties to form a bi-county association of dairymen.

Sixteen hundred tons of grapes were shipped from Ceres, Stanislaus County, during the month of October.

San Joaquin County wineries found themselves over-supplied with grapes and cut the price on later pickings from $8 to $6.

Merced County is threatened with law suit because of its veterinarian having killed a glandered horse without consent of the owner.

The fruit growers of Clovis, Fresno County, met last week to perfect an organization for better cooperation in handling and marketing their crops.

A mixed car of tangerines, lemons and oranges was recently shipped from Porterville to England for the holiday trade. A similar mixed car was sent to Honolulu.

A strong movement has been started at Dinuba, Tulare County, to make the California Farmers Union the central selling and marketing agency for this year's raisin crop.

Indications are that the celery crop of the San Joaquin delta lands will this year surpass all records. The biggest crops will be gathered from Andus and Sherman Islands.

At a recent meeting of the State Realty Federation held in Fresno war was declared on real estate fakers in an effort to put a halt to swindling schemes to which Easterners have been subjected.

A cotton grower recently from Texas has raised a satisfactory experimental tract of long staple cotton on land south of Porterville, and thinks cotton will do especially well on what are known as the lime lands.

Commissioner Schulz of Tulare County reports that while there is no scale infestation in any of the commercial orchards of the county, that black and yellow scale has been found on dooryard trees in Visalia.

A. G. Schulz, County Horticultural Commissioner of Tulare County, reports about 60 per cent of the navel crop in market for the Thanksgiving trade, the remainder to be shipped by the 10th of December for the Christmas market.

Residents of Inyo and Mono Counties are greatly interested in the movement for conservation of fish and game. El Camino Fish and Game Protective Association has been organized and is affiliated with similar organizations in different parts of the state.

A fifteen hundred mile thoroughfare is the conception of the Inyo Good Roads Club for a Panama Pacific feature. The plan is to put in shape an automobile road from San Francisco along the coast to Los Angeles, north along the Sierra Nevada to Lake Tahoe, from there via Sacramento to San Francisco.

Southern California

Southern California produces annually over 700,000 tons of sugar beets.

Demand for dried apricots is decidedly slack and growers are wondering.

Long Beach Poultry Assoiciation holds its annual meeting next week.

A Coachella Valley cotton grower has obtained 37 per cent lint in his cotton.

Imperial Valley is receiving about a hundred thousand dollars a month from its creameries.

The Anaheim sugar factory is still running on hold-over syrup, but will soon close down for the season.

Eucalyptus Day is proposed for Oxnard, Ventura County, to celebrate the opening of its new eucalyptus mill.

The Citrus Protective League composed of orange growers about Rialto was formed to protect groves from constant loss by thieving.

Coachella Valley is laying plans for its big fair this month. It is expected that the Southern Pacific will give special rates into the Valley.

The cotton gin at Calexico, Imperial County, was recently destroyed by fire. This will compel Calexico farmers to make the long haul to the El Centro gin.

A dredger is at work in the upper portion of the Newbert protection district, piling up sand on the river bank to hold in the flood waters of the Santa Ana.

National City, San Diego County, has a record of 482 carloads of citrus fruit shipped last year through one company. The bulk of the shipment was lemons.

Anaheim Orange Growers Association has just completed one of the largest packing houses in this region. It began handling navels on the 1st of the month.

During the Creamery Operators convention at San Luis Obispo last week dairy cows entered into a producing contest and butter makers participated in a scoring contest.

Some 800 acres has been signed up for planting of sugar beets by ranchers in the San Luis Rey Valley. A spur from the Santa Fe tracks will probably be built into the valley.

A San Bernardino man has crossed mountain sheep with his Leicester flock, developing a new type combining fine texture of wool of the Leicester with the greater size of the native breed.

The coming National Orange Show at San Bernardino will require double the show room used last year. The great tent used at the Watsonville Apple Show will be brought down to accommodate the exhibits.

Forest Supervisor Charlton recently visited the San Bernardino mountains and will soon have his foresters at work planting some 40,000 pine trees on the sides of the mountains which were burned off a few months ago.

The Cucamonga Citrus Fruit Growers Association at its last annual meeting elected the following directors: Chas. Motsinger, F. B. Van Fleet, A. J. Worthington, H. Albert, L. M. Ledig, O. W. Freeman and J. A. Hall. D. L. Barnes, the efficient manager, has been retained for another year.

The Coast

Spokane swine breeders are having trouble with hog cholera.

An apple show is being pulled off at Medford, Ore., this week.

The earliest snow on record at Medford, Ore., fell on Nov. 11th.

Yakima Valley sheep owners are moving their flocks onto the lower ranges of the valley.

The Douglas County, Oregon, Poultry Show Association is planning for a big show Dec. 27-30.

Another irrigation project has been launched in Eastern Oregon to cover ten thousand acres of land.

A Montana cattle man reports the price of $7.90 a hundred for range cattle, the highest ever paid.

A large representation of Seattle and Portland people attended the Spokane Apple Show last week.

During the last year fifty-one new granges were organized in Washington, and forty-six in Oregon.

The Washington County, Oregon, Cow Testing Association has voted to test cows every month next season.

School children of Salem, Ore., recently made an exhibit of agriculture at the Country Life Congress at Spokane, Wash.

Clarkston, Wash., is preparing to entertain 400 delegates to the coming meeting of the State Horticultural Convention.

The State Forestry Board of Oregon is planning extensive tree planting in the dry counties of the eastern part of the state.

Horticulturists of Clarkston, Wash., have declared war on the San Jose scale. They intend to manufacture their own spray.

Cold weather and snow the last week has stopped all farm work in the Inland Empire. Most of the crops were out of the way.

Unsettled weather in Eastern Washington caught some farmers unprepared, but many have winter wheat well up and in good condition.

A storage dam near Ellensburg, Wash., was threatened by storms last week, but finally was saved by releasing the stored water behind it.

Prominent members of the granges near Spokane met last week and discussed matters pertaining to the grange of Eastern Washington.

A swine disease thought to be hog cholera broke out in the herds near Newport, Wash. The State Veterinarian declared the trouble to be pneumonia.

Two members of the faculty of the Agricultural College of Nevada University are making a scientific study of the soil in Los Vegas Valley to determine its agricultural possibilities.

The fourteenth annual convention of Oregon wool growers recently convened at Baker and elected the following officers for the ensuing year: President, Jay Dobbin; vice president, E. P. Cranston, Baker; secretary-treasurer, John Hake, Baker.

Nearly a hundred thousand acres of swamp land in Northern Idaho and British Columbia are proposed to be drained by lowering the Kootenai Straits, thirty-five miles north of the international boundary. The land is suitable for grain raising.

MAN MUST EAT

There is money in

SUGAR and CATTLE

Share in the profits of an agricultural investment, comprising over 21 square miles of rich agricultural lands.

The land has an abundance of water in a district where irrigation, drought and frosts are unknown. Large tame grass pastures have just been prepared.

The land is free from incumbrances, which affords our investors the highest degree of security.

THE PRODUCTS OF THE RANCH ARE CATTLE AND CANE SUGAR, TWO OF THE WORLD'S BIGGEST DIVIDEND PAYERS, AND ON WHICH THE MARKET IS STEADILY ADVANCING.

In this district lean cattle fatten in four months in tame grass pastures and increase 50% to 100% in value.

Cane sugar is manufactured at one-third the cost of beet sugar.

Additional capital is required for improvements and to buy cattle to stock the ranch. A limited amount of investment certificates will be issued in units of $100 cash or on installments. Six per cent per annum interest is guaranteed, and we also share the profits with you. Option given to withdraw your money and profits or to become a part owner of this great property.

Applications for certificates will be filed in the order received. This enterprise is backed by some of the most substantial and well-known business men of Los Angeles. We invite the strictest investigation.

Send for free booklets and descriptive literature.

C. E. Reed, Secretary

710 Grosse Building Los Angeles, Cal.

CHOICE CHEAP CONCENTRATED

Modesto Alfalfa Meal

FOR

Cattle Poultry Swine

For prices see or write

THE GRANGE CO., MODESTO, CAL.

FOR SALE

Registered Jersey cows, heifers and heifer calves and two bull calves. The young things are sired by Brown Lassie's Advocate 80.045. He is grandson of Diploma's Brown Lassie and a descendant of Brown Bessie, Merry Maiden, Ida Marigold and others of noted merit. The heifers should duplicate the work of their ancestors, being out of high testing dams.

Also a few choice Berkshires of both sexes. Write for prices and breeding; or, better come and see them.

GEO. C. DICKSON - - - - National City, Cal.

When writing advertisers, mention Cultivator.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

CLEANLINESS.

We are apt to think that cleanliness in the dairy means only having the milkers in white suits, cows with washed udders in a clean, white lined building with good cement floors. It should mean much more than this. It should mean that neither food nor water is offered to the cow that one would not consider clean enough for his own consumption. It is understood that the cow's taste in food is to be consulted, not ours, for a porterhouse steak or oysters on toast would be as surely rejected by her as distasteful as we would reject a breakfast of corn silage a la wheat straw. Yet both of these meals can be equally clean. The mangers can be as clean as the plates. The man who keeps a few cows without making special arrangements for their care is the one that is apt to do careless work. This shiftlessness must end if the smaller dairies are not to be suppressed. The health officers are worrying the slovenly men all over the United States. The money paid out for fines might as well be put out as improvements. The time has passed when the producer can afford to be independent of the opinions and wishes of the consumer.

Water.

One of the things today that is the worst feature of the small dairy is the water supply. The cows rarely receive clean water in clean troughs. The fact that water is the largest constituent of milk is overlooked. Eighty-seven per cent of milk is merely water. In this water the casein, milk sugar and ash are mingled and the butter globules float. Now, if a cow's milk is so largely water, think what a "great thirst" she must have at all times. It is necessary for a cow giving eight gallons of milk a day to drink that eight gallons and as much more as she requires to make up the watery portion of her blood. A herd of cows suffering from a lack of water shrinks rapidly in milk. Poor water, diseased or filthy water makes the cow's stomach a strainer to remove the disease and filth before it passes into the pail. We trust there are no leaks in the internal strainer of the cow.

Disease.

The watering troughs are most perfect when made of cement with a wide flare at the top. Capacity is gained by length rather than by adding to the depth. In hot weather a roof of palm leaves supported by poles will shade the troughs and prevent the formation of long, slimy strings of green in the water. We like the shallow troughs, as they hold a smaller quantity of water and the waste is not great in cleaning. Where the water is pumped either by engine or by hand it requires courage to turn a large amount out on the ground. It also makes an ugly wet hole at the watering place when this is done daily. The watering trough should be swept out with a stiff broom, pushing it into the corners. Where wooden troughs are used they can be kept sweet by frequently whitewashing the inside. The lime prevents the forming of green slime, and the little that is dissolved acts as a purifier.

Swales.

It pays to fence the cows out of the stagnant water of swales. It is not good for their udders to be wet with foul water. Cows often pass garget and cow pox around in this way. We had trouble with the cows' udders at one time, and found out that when the swales were emptied by the falling of the water in Fancher Creek the trouble passed away. We fenced the swales up when we discovered they were filthy with manure. The cows having udder trouble from standing in this water may be giving diseases to people that we do not understand at present. The cows tracking in and out of a ditch to drink soon make a filthy muddy place that should not be tolerated on a clean man's ranch. The cows smear themselves with manure and mud, and when the udders and flanks are not carefully washed the milk is fouled. It seems that manure in the milk is not only mighty unpleasant to think about but may be deadly in effect. Scientific men tell us that the tuberculosis bacilli or germs found in milk get there frequently from the manure. The manure is often alive with them, while fewer are given off in the milk directly from the udder.

Bad Taste.

The cows are fond of drinking muddy, sun-warmed pools, and will leave the clearer running water to seek the swales. I presume it is like people eating overripe meats and birds. There is a company famous for its meals that boasts that no meats are used under five weeks old. They are not put into cold storage, but ripened at an even temperature. In birds such as plover and grouse the old rule was to hang them up until they dropped to the floor by ripeness before cooking. Cows like to drink the high flavored water, and must be controlled by fencing them out of these spots. A running stream may be used if it is certain that no filth is allowed to enter it higher up. Make a firm road for the cows to enter the stream. I am rather afraid of running water, as the people have a way of throwing dead animals into water. Anthrax breaks out along streams, and is thought to be carried by dead carcasses floating down stream. The water for the cows and stock should be pumped from wells if entire safety and cleanliness are desired. We have done this for years, and do not find it expensive. A good well 109 feet deep into pure water was driven, and then a smaller casing put down inside. Cement was worked down between the casings, and the water supply was permanently good.

Typhoid Fever.

Water is the carrier of typhoid fever, and the dairy cow furnishes the milk that is placed in cans washed in water infected with this bacillus. Now, milk is good for baby germs as well as for other babies. They grow and multiply with great rapidity, and in a few weeks the city or town using the milk has an epidemic of the disease. Dysentery, scarlet fever and cholera are all carried by water at times. The dirty watering place and the illy kept water are all disease producers in the cow, and may be for the master. Now, this winter while the

ASSOCIATED FARM PAPERS

ground is soft use the scraper to fill the swale holes and low wet spots. If these are too large to fill, then fence them up with wire fencing. Use willow posts, as these grow into trees for firewood quickly. When there are deep sinkholes the trees may line the banks, and the holes themselves be used as catchalls for the tin cans and other rubbish that piles up on the ranch. In a few years many will be filled up completely by simply dumping the clean trash into them.—M. E. Sherman.

SIGNS AND HABITS OF HEALTH IN HORSES.

Stands with feet flat on ground, limbs placed evenly side by side, with equal bearing and weight on each. The horse occasionally "stands at ease" by resting the hind limbs alternately—the joints are partly flexed, the fetlock is knuckled, the heel raised, and the toe rests lightly on the ground. The fore limbs are never so rested in health.

Rests at night and during the day, when undisturbed, by lying down with the knees and hocks flexed, and the body inclining slightly to one side. Rises by raising the forequarters first, then gathers the hind limbs under the body, and springs to the upright position.

Gait.

Even and rhythmical movement of limbs, and even distribution of weight.

Appetite When Stabled.

Eager desire for food—as distinguished from greediness or laconic picking—at regular feeding times. Desire for variant foods such as carrots, green stuff, grass and the like. Refusal of mouldy or coarse food, also bones, lime, sand, earth and rubbish. Slow, rhythmic grinding of the bolus of food.

In Pasture.

Almost continuously grazing and moving, except when attention arrested or when engaged in play or seeking shade from sun or shelter from wind or rain. Healthy working horses usually roll when just turned out; whinnying at familiar sounds, or when alarmed, is indulged in at intervals.

Coat.

Sleek, flat, glossy and even (no harness marks) when groomed; greasy to the touch when not.

Skin.

Supple and loose to handle; clean and free from scurf when groomed; scurfy when ungroomed. Pigmented (black) in most horses. Equable warmth and sensibility to touch all over.

Ears.

Mobile, alert, and evenly pricked.

Eyes.

Eyeball bright and glistening, without excess of moisture or tears; sensitive to touch or approach of finger. Pupil transparent, in shape oval or oblong, with rounded ends; sensitive to light, contracting in a bright light and dilating in darkness. White of eye (sclerotic coat) clear, even white; not bloodshot or tinged with yellow or other color. Haw of the eye and conjunctiva (lining of eyelids) carnation red, and moist. Eyelids mobile and sensitive.

Lips.

Mobile, dry, smooth, velvety, and sensitive to the touch.

Nostrils.

Dry, except for an occasional drop of moisture below the tear duct.

U.S. The U.S.

United States Cream Separator for 1912

Embodies Four Separator Requisites to a Degree

Unequaled by any other Cream Separator

Close Skimming: The U. S. holds the World's skimming record — an ironclad fact.

Easy Running: The U. S. is now the easiest running Separator on the market.

Easy Washing: Our new patented skimming device is washed and made perfectly sanitary in less time than any other manufactured.

Durability: The same sterling workmanship which has made the U. S. famous for long life with fewest repairs.

The United States Cream Separator for 1912 is sold at the lowest price at which an *efficient Separator* can be sold — and this is the only basis of true economy.

A New Way to feed Alfalfa

HERE is the way to feed Alfalfa so as to produce two to six pounds more milk per cow a day—feed it with Steam Dried Beet Pulp

Alfalfa-fed cows are simply ravenous for Steam Dried Beet Pulp—a fact full of significance to the dairyman who studies his herd and pays close attention to feeding problems. He soon learns that alfalfa, though rich in protein, is deficient in carbohydrates, the element which Steam Dried Beet Pulp supplies. Cows, like mankind, crave variety in their feed, and they show their appreciation of Steam Dried Beet Pulp in the ration by giving a largely increased milk flow, with a higher per cent of butter fat.

Steam Dried Beet Pulp is light, bulky, succulent, easily digested, helps the digestion of other food, absorbs water quickly, swelling when moistened to six times its original bulk.

STEAM-DRIED BEET PULP
Just Like Roots
Makes More Milk

It is cheaper than bran or rolled barley and greatly outclasses them as a milk producer.

Steam Dried Beet Pulp is the clean beets from which the sugar factories have taken out the sugar, *dried by steam*. Steam drying insures clean, pure pulp, uniform in quality, appetizing in color. It is never blackened by smoke, never burned, keeps indefinitely. Packed in 100-pound sacks.

Your dealer should supply you and give you facts about this feed that is increasing the milk and butter production of the country. If he will not, write us, and we will see that your needs are supplied.

IN THE FIELD MAKING MONEY-

or in the Barn Wasting It

Whether your horses work or not, their feed costs you big money. When a horse is laid up you not only lose the cost of *feed*, but also the profit that the horse would have paid if *able* to work in the field.

Since there is no way to *prevent* spavin, curb, splint, ringbone, sprains and lameness, your thought should be given to the quickest, surest and most economical *cure*. And for over 40 years, thousands of horsemen have depended on Kendall's Spavin Cure. It's the old, reliable, *safe* remedy that has saved millions of dollars' worth of *horse flesh*, to say nothing of the *worry*, *time* and *trouble* it has saved horse owners. *You* should get and keep a bottle of—

Kendall's Spavin Cure

for emergencies. You never can tell when you'll need it, and when the time does come, you'll be mighty glad you had the foresight to prepare. Here are samples of the thousands of letters we receive from grateful horse owners every year. Mr. J. J. Sandlin, New Hope, Ala., writes:—"I am a great believer in Kendall's Spavin Cure. A few applications have just taken an unnatural growth off my horse's back, thereby increasing his value $25.00 at least." Mr. J. B. McCullors, Haleysville, Ala., writes:—"Last July I bought a mule for $65.00. He had a bad Spavin and was unable to work but after using three bottles of your Spavin Cure, I cured it and he was sold in March for $180.00. I advise all horse owners to use Kendall's Spavin Cure." And Mr. Wm. Booth, of Grovette, Ark., writes:—"I have cured both Blood and Bone Spavins, taking the bunch all off and leaving the horse as sound as he ever was. The horse does not need entire rest while using Kendall's Spavin Cure. Light work and careful handling are better than standing in the barn. If the horse was in the pasture not many people would take proper care of him. I use the Spavin Cure a week at least, sometimes three, according to the severity of the trouble. There is enough in one bottle to cure three large Spavins if used according to directions. It is excellent for bruises, both for man and beast. Your Spavin Cure will cure Thoropin in a hurry. With over twenty years' experience with this remedy I know what I say to be true. If one doubts my my word he may bring me a horse with a Blood Spavin on one leg, Bone Spavin on the other and Thoropin on both and I can make him a sound horse in six months. What I have done I can do again and what I have done others can do."

Why take chances on any other remedy—when you know positively that Kendall's is *right*. You can get Kendall's Spavin Cure at any druggist's, $1.00 per bottle, 6 for $5.00. Ask for free book, "Treatise on the Horse," or write direct to

FANCHER CREEK NURSERIES, Fresno, Cal.
Geo. C. Roeding, Pres. and Mgr.

When writing advertisers, mention Cultivator.

Mouth.

Lining dull pink color, moist, and free from clamminess.

Teeth.

Incisors free from chipping or signs of wear, except on nipping surface; molars, even grinding surfaces, free from jaggedness at edges and from decay.

Gums.

Upper bars level with teeth, soft and springy, but not tense, painful or swollen, except during teething.

Tongue.

Mobile, moist, and free from furriness.

Visible mucus membranes (linings of nostrils, eyelids and vulva), carnation red in color, and moist.

Hoofs.

Shape approaching the circular on the ground surface; the hind hoofs are somewhat more oval. The natural angle at which the front of the hoof meets the ground at the toe is about 50 degrees in the fore feet and 55 degrees in the hind feet, the latter being more upright and having usually higher heels. Wall.—The surface of the wall should be even, smooth and polished, free from cracks, rings or unevenness of growth. Heels broad and open. Bars strong and thick, to afford bearing surface for heel of shoe. Frog broad, full and springy, free from moisture and foetid smell; should show signs of wear by contact with ground. Sole dry and flakey; free from moisture; absence of softness and powdering texture. The hoof horn should be tough and yielding, not rigid, brittle or "shelly." The off and near hoofs should be uniform in size and shape.

Defecation.

Moderate frequency of bowel movements—the average being ten or twelve times in twenty-four hours—unaccompanied by foetid flatus and without unpleasant smell.

Faeces (dung).

Quantity.—From twenty-five to thirty-five pounds during the twenty-four hours, a greater bulk being passed during the night than the daytime. Appearance.—Moderately dry and balled, with moderately firm coherence of particles, but without gluey consistence or coating; free from whole grain or only partially disintegrated food particles; color corresponding with character of food. (Balled faeces of normal cohesion float in water.)

Urination.

Desire to "stale" on returning to the stable or on being bedded down.

Urine.

Quantity varies according to diet and activities, being less in horses at work; average about nine pints per day, passed at three or four stalings. Appearance.—Yellowish-red or straw color, and turbid, without excess of sediment, blood tinge, sliminess or foetid odor. The urine of mares in season has an oily consistency.

Temperature.

Internal, 100 to 101 degrees. External, moderate and even warmth of body surface; warmth of ears, extremities (pasterns and cannons) and hoofs uniform.

Pulse.

From thirty-five to forty-five beats per minute.

Breathing.

From twelve to fifteen respirations per minute. Even rhythmical rise and fall of ribs and flank; absence of tifting cough or other noise, and of double flang heave on sharp exercise.—American Cultivator.

Veterinary

Answers in this column by Fred G. Matthews, M. S., D. V. M., 1223 Central Ave., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Thrush—Itch.

What is good for thrush in horses' feet? Can it be cured? Is there a cure for the itch? This horse was in this condition when I bought so I do not know how long he has been that way.—Subscriber, El Centro.

The danger from thrush alone is trifling, as it is readily cured by simple remedies. However, when thrush is a sequel to deeper-seated inflammation, it will recur when cured, while the cause exists. Do not mistake thrush for canker. In thrush the frog is undermined by black pus; in canker a soft, white growth appears which does not yield to treatment. Have your blacksmith pare away all ragged edges of the frog and follow each pocket of pus to its bottom. Then swab the parts with pure turpentine and work dry calomel into all cavities. For itch use coal tar disinfectant one part, neatsfoot oil three parts; shake and apply to itching surface every third day.—F. G. M.

Tail Rubbing.

A horse seven years old is always rubbing his tail and biting himself on the sides. Otherwise he is healthy.—Subscriber, Lincoln.

Tail rubbing is sometimes caused by parasites lodged within the rectum. The grub of the red-tailed bot fly (Estrus hemon rhoidalis) hook themselves to the lining of the rectum and two kinds of round worms are known to infest this part. Externally the skin of the tail may be irritated by mange parasites, mites, or eczema. Oil the hand and insert it into the rectum and search for bots or grubs. Remove the hand and look it over carefully for small round worms. Bots must be picked off with the fingers. For rectal worms inject a gallon of warm water in which a plug of tobacco has been steeped for some hours. Failing to find the cause within the rectum examine the skin of the tail by scratching several places, watching the lips of the horse at the time. When the spot which itches is reached the head will be turned and the lips worked, showing a desire to assist in the scratching. Treat by washing thoroughly with warm water and soap; dry; and apply a mixture of Eucamphol one part, water four parts.—F. G. M.

Profit in the Poultry Yard

Practical poultry people who may have ideas from their experience as to methods of feeding and housing and general care of poultry will confer a favor upon the Cultivator and its circle of readers by sending in concise accounts. Mrs. Basley is always willing to answer queries, which with the experience of others should make this a most valuable feature in poultry life on the Coast. Opinions or matters of a personal nature should be omitted, but a concise statement of facts is always valuable.

STATE POULTRY WORK.

By Henry Langenschwadt.

Fruit is one of the leading, if not the leading, product of California, all varieties taken together as a whole. The growth of this industry has been comparatively recent, in the past two or three decades. Success has not been accomplished without overcoming difficulties and solving problems encountered. Yet there is much to be learned, and many more problems to be solved. This will never end. One needs to be constantly on guard for insect pests and other things. The government, both state and federal, has been and is doing much to aid the fruit grower, having men engaged in certain lines of work gathering information and experimenting to ascertain facts, doing what private individuals never could afford to do. This is as it should be, and we are glad to see it so. The government cannot do too much of this kind of work, if money expended is spent wisely and in the right way.

Poultry is another of California's growing industries. The growth in some sections has been remarkable. The state can boast of having in one of its counties one of the greatest poultry centers known. There has been some state aid given the poultry man, but mostly he has been left to solve his problems at his own expense and experience. He has had much help from poultry work done in other states. Nevertheless the conditions are often so different here that same cannot be applied as there. The writer beileves the reason that more state aid has not been given to solution of the poultry man's difficulties is because it has not been asked for. If poultry men would insist more, they would receive more. There is instruction given in poultry work at two of the state's institutions, and it has been included in demonstration trains. The experiment station, it seems, has been discontinued. Such is the extent of state work being done.

Counting all the persons that have just a few, and those that have hundreds and thousands, there are probably more individuals interested in poultry than in any other branch of farm work. It is not alone those that are now interested, but the many, many more that will be. Poultry is being consumed as meat more and more, and will continue to be. Cattle ranges are being farmed. The increase in cattle will not keep pace with increase in consumption, so that the price of beef will be higher, and poultry will be used more. Poultry will be one of the big industries of the state.

The climate and conditions peculiar to the state confront you with difficulties in raising and keeping poultry different from those in other sections. The state can well afford to assist the poultry man more and extend him a helping hand. It ought to have a poultry department second to none in the country, engaging the best men to be had to conduct it. Let the poultry men get together and insist on it till secured. All cannot be accomplished in a day or in a month or year, but a start should be made. It will mean years of work to solve some of the problems. We have lots of them. Many are peculiar to this section. Our climate, soil, seasons, etc., are not like those elsewhere. It is said that one must learn all over again when he comes to California to raise poultry. This is true to a great extent. A few thousand dollars now will do more than five or ten times that amount ten years from now. The amount of money that could be saved annually if people knew more and better what to do when engaging in poultry raising would surprise you. It would pay for many poultry departments with best of equipments.

Poultry is receiving more attention in all parts of the country. One state after another is taking up the work, establishing a department for instruction and experimental work. We want to get in line. Not because others are doing so, but because we need it, and need it badly.

NOTES.

It must be evident to anyone who thinks that two very high-class birds being mated, their good properties must be in the blood of the progeny, even if they do not show outwardly. Therefore the breeder's task is to bring them out. This can best be done by pairing the best hen back to her father, the best young cock to his mother, or pairing two of the young together. It is a hundred pounds to a penny that such mating will bring the desired success, and if followed will prove both profitable and pleasurable; whereas the constant introduction of fresh blood can end in nothing but disaster and disappointment.—American Pigeon Keeper.

Age causes an egg to become stale and shrunken and it can never be classed as a fresh egg. Heat seriously affects the quality of eggs and in warm weather they should be gathered as often as possible. Moisture causes molds to develop and quickly changes the quality of the egg. Muddy weather means dirty nests, consequently dirty eggs. Nests built upon the walls of barns and hen houses are often used as roosting places, causing filth to accumulate, resulting in dirty eggs. Dirty eggs must be handled as second grades; washed eggs are just as bad. Eggs deteriorate in quality if they are left behind the kitchen stove or are stored in damp or musty cellars.

The poultry business is one of the safest and surest money producers if built up properly. Too many people go into poultry raising on a large scale and expect it to furnish a big revenue from the start, and so meet with reverses. The best way is to begin in a small way, and make the business pay a revenue from the start if possible, and increase the number of birds as conditions warrant. The experience that will be secured in working up the business will be worth many hundreds of dollars.

There is good money in geese for meat and feathers. Some object to these birds on account of their harsh noise. Geese are hardy, long lived, and subsist on grass and the cheapest of feeds.

Keep Your Layers Laying

Successful poultrymen look to a continued yield of eggs and to get it they feed egg making food.

COULSON'S EGG FOOD MADE IN PETALUMA

will sustain your hens in the egg producing period longer than any other food on the market.

By analyzing an egg we find of what it is composed. By studying the needs of the hen we determine what will produce a given result and by buying in large quantities we secure the lowest possible prices.

Our food is made right and sold right. We give you more in egg making material than you can secure in any other way. Modern poultry success demands the right food.

Coulson's Chick Food

is a prime factor in raising chicks. You can raise the little fellows to strong and vigorous maturity if you give them a good start. Coulson's chick food is the food to use.

Our new catalogue, Poultry Feeding for Profit, is just off the press. You can secure one free by writing for it.

A Sure Way To Get More Eggs

Remember it is not always the amount of ration a hen *eats* that goes to make eggs, but the amount she *digests*—keep that fact uppermost in your mind—act on it—and you'll make the egg business a *paying* business. Dr. Hess has compounded a number of bitter tonics which help the hen to digest more of her food and thereby increase her egg yield.

DR. HESS Poultry PAN-A-CE-A

is the personal formula of Dr. Hess (M.D., D.V.S.); it solves the problem of converting nutritious food elements into eggs by sound digestion. By exactly the same process, Dr. Hess Poultry Pan-a-ce-a fattens broilers and helps the chicks to vigorous maturity. A penny's worth feeds thirty fowl per day—sold under the most liberal guarantee.

Our Proposition—You buy Dr. Hess Poultry Pan-a-ce-a of your dealer. If it fails to make your hens lay more eggs and keep your poultry healthy, he is authorized by us to refund your money.

1½ lbs. 35c; 5 lbs. 85c; 12 lbs. $1.75; 25 lb. pail $3.50.

If your dealer cannot supply you, we will. Send 2c for Dr. Hess 48-page Poultry Book, Free.

DR. HESS & CLARK
Ashland, Ohio

DR. HESS STOCK TONIC. Been 18 years on the market—proved a continuous success as a flesh, muscle and milk producer. Good for Horses, Steers, Hogs, Cattle and Sheep. Increases digestion—lessens nutritive waste of feed—makes a splendid conditioner. Not a ration—but makes a ration more valuable. Guaranteed just the same as Dr. Hess Poultry Pan-a-ce-a. 100 lb. sack $7.00; 25 lb. pail $2.25. (Smaller quantities at a slight advance.) Send 2c for Dr. Hess Stock Book, free.

Free from the 1st to the 10th of each month—Dr. Hess (M.D., D.V.S.) will prescribe for your ailing animals. 96-page Veterinary Book free for the asking. Mention this paper and enclose 2c stamp.

RAISING TURKEYS.

Since it is known that turkeys are harder to raise than chickens, ducks, or geese, when we hear of a breeder having great success in maturing the majority he hatches I am always anxious to know his method of doing things. There is a breeder in this county who has grown more turkeys, perhaps, than any other man living today. I had often heard of him through his friends, as he never advertises through the journals. Always has been able to sell his stock for breeding purposes due to his great success in growing them. It is not often that a man can build up such a trade privately, but this gentleman has done so and for that reason I have been anxious for years to visit his place in order to meet him personally. I had never been afforded this opportunity until this fall, when we made a trip to his place. On arriving we received a warm reception and were shown over his place and made to feel quite at home. Why it is that all men are not endowed with an agreeable disposition like this prince of men is a mystery to me. He was a free talker, a good entertainer and did not hesitate to reveal to us his method of handling his fowls.

After showing us his flock of turkeys he looked us square in the face and said: "What do you think of them?" I said: "Well, sir! This is just about as fine a flock of turkeys as one usually finds. I have seen larger flocks and of various sizes, but I don't think I ever saw a more uniform flock or better marked flock than yours. I am frank to say, your method of handling turkeys is certainly a good one and I would like to know your methods."

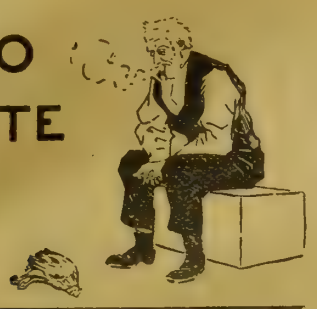
"In expressing your opinion of my flock you made the remark that you had seen larger flocks than you see here. Now right there is where I attribute largely my success. Turkeys bring a good price in the market, you know, and the majority of farmers try to grow too many turkeys in one flock. I learned years ago that large flocks of turkeys could not be grown successfully, hence I have never attempted over 60 or 70 turkeys in one season. Another thing: So many growers just turn their turkeys out and just let them go, never giving them any care whatever. I have noticed through the journals you advocate allowing the hens to care for the poults themselves and never feed any artificial food. I agree with you there, but I go just a little further than that. I like for the poults to depend largely on the mother turkey for their support, yet I always bring them home at night and make them go in that enclosure of wire netting you see there. I give them a small amount of wheat at night, never failing, and they always come home along about four or half past four and go into that enclosure of their own accord and if I am not there with the wheat when they arrive they always go up on the roost poles and wait my coming, for they know I will come. They don't know anything else, only to go in this enclosure at night. They never have roosted outside.

"Now, let me tell you another thing, which I am sure is the cause of all those poults living and looking as healthful as they do. I went to the tinner and had him make me a small funnel with a long slender spout about five inches in length, just large enough to allow it to pass freely down in the throat of the poults, passing the entrance of the windpipe. Every Tuesday morning I give one teaspoonful of milk and one drop of turpentine to each poult. On Friday morning I do the same thing, every poult gets his medicine regular. I give them this amount until they are two weeks of age, then I increase the turpentine to two drops and the milk to one and one-half teaspoonfuls to each poult. This is some trouble and a little work, but it pays. Almost all the turkeys died around here. I gave this treatment to mine as I always have done and never lost any. I have lost but three or four and I think the crows got them.

"Since this so-called black head has become so common in this country you have to give them this treatment. It immunes them from the disease and if you don't give it to them you can't raise them, that is all there is to it."

This is about the best thing I know of, if it will work and I am going to give this treatment a fair test another year. If it will work for one breeder it should work for all and from what I saw at this farm certainly stamps quite a bit of faith in me as to the merits of the treatment. I have used castor oil and turpentine and some milk and turpentine on the growing stock in the fall when they feed too freely on green corn and find it corrects almost all forms of bowel troubles, but never did give it regularly to the poults. However, I have great

TOO LATE



Don't be "Too Late!" You have seen your chickens moping, sneezing, coughing, eyes watering and heads swollen. You have seen them fight for breath and die. That's ROUP. It's humane to relieve them. It's dollars saved to cure them.

faith in the treatment and believe it will do the work. The enclosure this poultryman mentioned for his turkeys to roost in was built directly in front of his large brooder house he built for his young turkeys. It was inexpensive and consisted of four posts with woven wire stretched around them and over the top a plank six inches in width was run along on the bottom. A neat handy gate was placed at the end and stood open through the day. Comfortable roost poles were placed inside this enclosure which was ten by twenty, making it sufficiently large for 75 or 80 poults to roost in comfortably. At night the gate was closed and locked, no "varmints" could enter and any thief would have trouble in getting inside unless he cut the wire. I am convinced that his methods of growing turkeys is a good one and one that is worthy the consideration of every turkey grower who has had trouble with this fatal black head. —Farmer's Guide.

SCIENTIFIC FEEDING FOR EGGS.

There is too much haphazard feeding among poultry men. Feeding should be so arranged that egg production would become a certainty and not a lottery.

It is safe to assume that "free range" poultry generally are fed nothing but corn. They are left to their own free will to eat all the bugs, worms and greens they can find. That will do very well for a season, but the time will come when the animal and vegetable foods become limited and finally exhausted. Then it is necessary to supplement natural by artificial means.

If allowed absolute freedom among all kinds of foods it is a debatable question whether a hen will "balance" her own foods.

For all practical purposes we will consider all foods as resolved into three elements only—protein, carbohydrates and fats.

Each of these elments is subject to further resolution, but they are not considered in the balancing of rations. The protein element is nitrogenous and is exclusive and independent of fat and the carbohydrates, yet, if overfed, may have a fattening tendency. It is the "lean" of foods and is used to build up muscular tissue. The fats are composed of ether extract and are used for fuel and strength. They are used largely in winter for bodily warmth. In summer this element must be limited.

Carbohydrates are used largely to give form to the organism and to a limited extent take the place of fats in supplying heat and energy. These three elements must be used in the proper proportion to secure the maximum egg production, so desirable. Right here I must state that the analysis of foods has been found to vary so much that I am compelled to use what may be designated as average composition. To be absolutely scientific each feeder would have to be his own chemist. So it may be safe to conclude that science itself is limited or progressive. Not being a chemist myself, I shall be governed in all my calculations by the average composition of foods as found in Bulletin No. 23, of the Agricultural Department of Washington, D. C.

As has been indicated before, the proteins, carbohydrates and fats must be correctly proportioned for best results. Scientists have decided to call this arrangement the feeding ratio. From experience it has been found necessary to change the ratio with the variation of temperature. For our calculation I will divide the feeding year into three seasons—the hot, the cold and the temperate periods. The hot period occupies the three hottest months, the cold period the three coldest months, and the temperate period the three months between the hot and cold periods. We shall further designate this as the transitional period. Now, when we make use of one pound of protein and four pounds of carbohydrates and fats combined the ratio is said to be 1:4. This is a good feeding ratio for the hot summer period. I therefore submit the following table for our guidance the coming year:

June, July, August feeding ratio	1:4
September feeding ratio	1:4.25
October feeding ratio	1:4.5
November feeding ratio	1:4.75
Dec., Jan. and Feb. feeding ratio	1:5
March feeding ratio	1:4.75
April feeding ratio	1:4.5
May feeding ratio	1:4.25

You will observe that as the cold season is approached the carbohydrates and fats are gradually increased, also they are decreased as the summer period is approached. In other words, the colder the weather the wider the ration, and the warmer the weather the narrower the ration. That arrangement is calculated to prevent an overproduction of fat at any time of the year and at the same time allow the hen to eat all she wants at all times.

Send in your list of foods to be formulated a month ahead of time that each formula may appear in due season for each month intended.

INFERTILE EGGS KEEP BEST.

A large part of the heavy loss from bad eggs can be obviated by the production of infertile eggs. This has been demonstrated beyond a doubt by the investigations concerning the improvement of the farm egg which during the past two years have been conducted in the Middle West by the Bureau of Animal Industry of the Department of Agriculture.

Secretary Wilson of the Department of Agriculture estimates that, between the producer and the consumer, there is an annual loss of $45,000,000 in the egg crop of the United States, the greater portion of which falls on the farmer, who is by far the largest producer. Of this enormous loss, about one-third, or $15,000,000, is caused by heat which develops the embryo of the fertile egg, causing what is known to the trade as a "blood ring." As it is impossible to produce a "blood ring" in an infertile egg, such an egg will stand a higher degree of temperature without serious deterioration than will a fertile egg.

The secretary says that if farmers and others engaged in the production of eggs would market their male birds as soon as the hatching season is over, a large saving would be made, as practically every infertile egg would grade a first or second if clean and promptly marketed.

Alfalfa is an egg producing material. It is rich in nitrogen and mineral matter, thus providing the hens with substances that are derived from it in forms most suitable for the purpose desired. Lime is an essential substance in the production of eggs, and there are some that use oyster shells for supplying the hens with lime, but alfalfa contains lime in a soluble form and ready prepared for use. The various grains are deficient in lime, and when poultry receive no food but grain, it is impossible for the hens to lay perfect eggs, many being soft shelled. When the needed elements are supplied, and the hens lay regularly, the carbonaceous matter is appropriated by the eggs, but if the hens do not lay, they become fat and remain in a condition that invites disease. Alfalfa or clover by displacing grain, supplies the hens with substances which are lacking in grain and also provides bulk food and heating food. It is good both in the dry and green state and happy is the poultryman who has an alfalfa patch for his hens to wander in. They can get animal and green food at the same time. If you don't raise alfalfa yourself, buy it by all means and save half your grain bill.—Colemans'.

Lee's Egg Maker

Are your hens laying *now?* If not, are you doing your part in furnishing proper feed. Protein—*digestible* protein—is the feeding secret. It's a simple matter to get food rich in protein, but the percentage of it that is *digestible* is the thing to consider. Lee's Egg Maker is almost a pure meat product, clean, sweet, and wholesome, and contains more protein in *digestible* form than any other meat product. Successfully replaces all other kinds of meat food at *less* feeding cost and better results. That's our *guarantee.*

Prices 25c to $7.00, according to size.

GERMOZONE

is the best health-insurance you can furnish your fowls. Indispensable as a remedy for *Roup, Colds, Chicken-Pox,* and other poultry ailments. Disease in your flock now will probably mean diseased birds all winter and poor breeders in the spring. Germozone twice-a-week tones and builds up the system, destroys disease germs, insures better and healthier stock *now* and strong, vigorous birds for the breeding season. Best guarantee *against* disease; surest remedy if disease has already taken hold. *Either tablet or liquid. Price* 50c.

Lee's goods are on sale in almost *every* town, but if yours is an exception send your order direct to us and ask for our *free* offer.

GEO. H. LEE CO.,
225 W. 2d St., Los Angeles, Cal.

Send for your *free* copy of Lee's New Poultry Book. Interesting; instructive. The "best yet."

Write us describing what you wish to buy. When in the city a personal call will show the largest stock and assortment in the Southwest. Arnett & Company. Established 1892. 112-118 South Los Angeles Street, Los Angeles.

DUCKS

We have a few genuine "Rankin" strain Mammoth Pekin drakes to spare that will add a pound each to your next lot of ducks. Grand big fellows, fit to show. Price two to five dollars each. Eggs from our best pens, $10 per hundred, $2 setting. Long Beach Poultry Ranch, Long Beach, Cal.

Five varieties of Ducks, four breeds of rabbits. Catalog free. Caldwell Bros., Los Angeles, Cal. Phone Glendale 421 R.

Indian Runner duck eggs from heavy laying, white egg stock, $1.50 per dozen. Mrs. Fred Chester, Santa Rosa, Route 2.

POULTRY SPECIALITIES.

For Sale—Incubators, brooders and poultry supplies, new and second-hand incubators bought, sold and rented. Also the new California. Write and ask about it. California Poultry Supply House, 852 Los Angeles St., Los Angeles, Cal.

FARM LANDS FOR SALE.

For Sale—
BEAUTIFUL "OAK DELL HOME."
No. 666 Cal.—Situated 3½ miles from the thriving town of Escondido; contains 132.44-100 acres, about 30 acres of alluvial soil around and near the house, several acres more of good land on different parts of the ranch. Many beautiful live oak trees on the ranch, and one especially fine, standing in the front yard; splendid well of water with windmill and tank; brand new bungalow of six rooms, modern and well built; new barn, 20x37 feet, 16 feet to comb; store room, 12x32, divided into three rooms. Stone house 10 feet square in the clear with cement floor, thick walls, making a cool place to keep canned fruit and milk. Good woodshed. One of the desirable features of the bungalow is a fine chimney and fireplace. Abundance of wood on the place makes this desirable and practical. There is abundance of living water in the creek that runs through the place; this is one of the most desirable features of the place. This place is truly one of nature's beauty spots, and would be fine for a resort. Must be seen to be appreciated. The mountainous land is fine for pasture. F. J. Conrad, "the Hustler," Escondido.

WILL YOU BUY A HOME
In one of the best colony districts of the State? We have sold many 20-acre tracts in the last three weeks to people who have inspected the land, and they pronounce the land first class and the conditions ideal.
There is plenty of water, creamery, cannery, churches, schools and packing houses.
Close to 4 Railroad Stations.
We want the right people and will make terms to suit, and, if desired, will accept part of crop each year after first cash payment until land is entirely paid for.
ORCHARD AND FARM LANDS COMPANY, 309-310 Stimson Bldg., Los Angeles.

For Sale—LINDSAY ORANGE LANDS.
Eleven days before Christmas the fourteen packing houses of Lindsay sent out pay checks for the 1910 navel orange crop. Lindsay orange district had the holiday orange market all to themselves, and of course they sold at good profit.
Why not invest in some of this Lindsay orange land and get the benefit of rapidly advancing prices?
Ten-acre tracts in Lindsay, $150 per acre, on easy terms.
Choice Tulare alfalfa lands, water in abundance; any size tracts, $50 per acre up.
KIOUS-WHANN REALTY CO.,
235 Mason Bldg., Los Angeles. A4164.

170 Acres—¼ mile from R.R. station and school, $30 per acre. 100 acres in crop; more can be planted to trees or vines. Partly warm citrus soil or for winter gardening; some alfalfa land; well 50 feet deep, 10 feet across, water 8 feet from surface; all under fence; no other improvements. Terms $3000 cash, balance at 7 per cent; will not trade. Address C. F. Haney, Escondido, Cal.

Choice Orange Land, Exeter District—63 acres, 3 miles south of the town of Exeter, California, three-quarters of a mile from Southern Pacific railroad station, right in the foothills, leveled, water developed on it. Write for particulars. The Phalanx Company, 513 Chamber of Commerce, Los Angeles, Cal.

For Sale—
THE ORANGE GROVE MAN.
Large list of orange groves in best districts. Seven years' experience in growing oranges.
A. W. RICHARDS,
THE ORANGE GROVE MAN,
Claremont and Pomona, Cal.

For Sale—Near Lancaster, Cal. Bargains in improved and unimproved land. Also relinquishments for sale or trade. Some homestead land. A. S. Burnham, Box 451, Lancaster, Cal.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

For bargains in orange orchards in the famous early orchard districts at Globe, address E. A. Miller, Manager Globe Realty Co., Globe, Cal.

For Sale—5-acre tracts, with water. Ten years' time. Famous Coachella Valley. Earliest fruit and truck land in the United States. J. Win. Wilson, Indio, Cal.

San Diego County! My splendid weekly newspaper will tell you about this great county and superior climate. 16 weeks for 15c. H. P. Rising, publisher, Escondido, Cal.

For Sale—A-No.-1 alfalfa lands, situated in the San Joaquin Valley. Cheap water. For particulars see C. Menefee, 413½ S. Hill St., Los Angeles.

TURKEYS

MAMMOTH GOLDEN BRONZE TURKEYS. "International Tom," first prize and special prize turkey at the International Poultry Show, and said to be the largest turkey in the world, heads the flock. Young stock with large bone, long body, full breast, well marked and early maturing, for sale. Their mothers are from the leading prize-winning flocks of several Eastern states. I claim to own the best flock of turkeys on the Coast. Write soon, as orders are coming in fast. Prices very reasonable.
GEO. A. SMITH, Corcoran, Cal.

For Sale—Thoroughbred Mammoth Bronze Turkeys, both hens and toms, all ages. Also a few proven good mothers. Special price to close out entire lot. Address Quality Egg Ranch, Artesia, Cal. P. E. Santa Ana line to Coyote Station.

Send us a list of what you want, and we will quote prices which we feel certain will interest you. O. J. Weber Co., 226-227 East Sixth St., Los Angeles, Cal.

Auction Sale

75 FINE DAIRY COWS

On the **Maplewood Ranch,** 2½ miles south of Downey, 1 mile east of Clearwater, and ½ mile north of

CRUTCHER.

Take Santa Ana Electric Cars to Crutcher, and walk ¼ mile north.

Tuesday, December 12, 10 O'clock A. M.

Stock consists of 70 head of fine dairy cows, nearly all large, fine Holsteins, a few choice Jerseys and Durhams, all large, rich milkers; many now fresh, balance coming in soon; all in pink of condition—in fact, an exceptionally fine lot of dairy cows. Purchasers looking for first-class dairy stock should not fail to attend this sale.

6 calves, from 3 to 6 months old; one 12-months-old Holstein bull from Mr. Pellessier's herd, near Whittier. This bull is sired by a registered Holstein, and from one of Mr. Pellessier's best cows; an exceptionally fine and well bred individual.

IMPLEMENTS—Heavy farm wagon, light farm wagon, milk wagon, Milwaukee mower, hay rake, disc, corn planter, gang and walking plows, scraper, power feed mill, Cultivators, harrows, seeders, corn sheller, leveler, double and single harness, buggy, 20 tons good oat hay, 1 ton corn in ear, small tools, lumber, etc.; in fact, the complete equipment of the Maplewood Ranch.

Having leased the ranch, owners have instructed us to dispose of their complete outfit on above date, **positively without limit or reserve.** Prospective purchasers are requested to visit ranch prior to sale and see these cows milked. Free lunch at noon.

TERMS: $100 and under, cash; over that amount, one-quarter cash, balance six months' time, with note and approved security and 8% interest. Liberal discount for cash on time sums.

Do not miss this genuine closing out sale.

SAVING THE SUNSHINE.

Most true conservationists will agree with the Secretary of the Interior in his condemnation of those loud talkers who spend their energies in discussing the wickedness of waste without at the same time being willing to assist in any practicable plan to stop the evils they so greatly deplore. We suspect, however, that few, even of those good citizens who believe in the wisest use of natural resources and who are sincerely eager to safeguard the public good both now and hereafter, realize how easy it is to neglect opportuntities for conservation which lie at our door. The coal and forests in Alaska are of vast importance, but the discharge of our duty with regard to them will not occupy much of our time. A nearer need is to see that we make the best use of natural resources in our own back yards. How about making "two blades of grass grow where one grew before?" Why isn't that just as important as keeping the coal or saving the streams or doing any of the thousand and one things that we individually can only talk about? Our truest conservationists are those gardeners and farmers who catch the sunshine and husband the rain and strive intelligently to keep pace in production with the increase of the non-agricultural population.

The very greatest product of land is derived from "intensive gardening." Through generations of intelligent selection and breeding thoroughbred seeds have been developed whose yield far surpasses in quality and quantity that of the ordinary strains. You can be a true conservationist if you have a successful garden. Be sure, however, to start right by planting thoroughbred seeds. These can be bought of seedsmen having sufficient capital and experience to know what they are about and a reputation to maintain.

MEAT SUBSTITUTES.

Meat contains the compound necessary for the growth and repair of body tissue. In selecting foods to take its place, one must choose those having this compound.

Milk contains all the food principles and may be used as a substitute for meat. As cottage cheese it is particularly rich in protein, the tissue building compound.

Eggs are a valuable substitute, as they can be served in such a variety of ways. Besides the various kinds of omelets, the poached egg, the boiled egg, the fried egg and the scrambled egg, they may be served with cheese, tomato sauce, white sauce, as a souffle or salad eggs.

The two following recipes make attractive and appetizing dishes:

Egg Timbals.

Make a white sauce, using 1 tablespoon butter, 1 tablespoon flour, and ⅔ cup of milk; to this add the yolks of 3 eggs, beaten until thick and lemon colored; 1 tablespoon chopped parsley, ½ teaspoon salt, ⅛ teaspoon pepper and a few grains celery salt. Beat the whites of 3 eggs until stiff and dry, then cut and fold into the first mixture. Turn into buttered molds, set in a pan of hot water and bake in a slow oven until firm. Remove from molds and serve with tomato sauce.

Tomato Sauce.

Cook 1¾ cups stewed tomatoes with 1 slice of onion, ¼ teaspoon salt, 2 teaspoons sugar and ¾ teaspoon pepper 15 minutes, strain and add to 3 tablespoons of flour which has been mixed with 3 tablespoons melted butter.

Eggs a la Goldenrod.

Make a thin white sauce, using 1 tablespoon butter, 1 tablespoon flour and 1 cup milk. Chop finely the whites of 3 hard boiled eggs and add to white sauce with ½ teaspoon salt. Cut 4 slices of toast into halves lengthwise, arrange on a platter and pour the sauce over. Force the yolks of the eggs through a strainer or potato ricer and sprinkle over the top. Garnish with parsley and toast points.

Cheese is even richer than eggs in the tissue building compound, and, according to investigations recently made by the government, is easily digested when properly prepared. Cheese may be cooked with macaroni, potato or rice. It may be served on toast, as rarebit, or made into a souffle or fondue.

Among the vegetables which may be used in place of meat are the lentils, peas and beans.

Almonds, pistachio and peanuts are rich in tissue building material, while filberts, walnuts and pecans also contain a considerable amount.—Charlotte Carpenter, Colorado Agricultural College.

DO A LITTLE PAINTING.

Why not use a little paint occasionally, good people? Not long ago a painted farm building was a curiosity, but farmers are learning that paint is a good investment. It prolongs the life of buildings, adds value to the price of the farm, and helps to make a "home beautiful."

Buildings last 25 to 50 per cent longer if painted, says C. F. Chase, assistant in farm mechanics at the Kansas State Agricultural College. That means that a building which would last 50 to 75 years unpainted would last 75 to 125 years if painted. It is the same with certain fences and farm implements. It is easy to see that paint saves money.

Unquestionably, paint raises the value of a farm. A place with well-kept buildings, painted regularly, will sell for from one-half to five or ten times more than it would if it wasn't well kept. The story of an Ohio farmer's experience with paint proves this. A farmer in that state wished to sell his homestead. He had allowed it to run down until the fences were very poor and the house and buildings were a disgrace to the neighborhood. Finally a wide-awake man came along and purchased this farm. He spent $200 in painting the buildings and repairing the fences and tidying up in general. Within two months he sold the place for $1600 more than he paid for it. He did nothing to the crop-producing power of the soil. He had only made the farm neat and attractive and much more "homey."

In making the "home beautiful" perhaps the largest and best paying investment is effected. Who cares to live in an old sunburned house that never felt the touch of a paint brush? Who would blame a boy or girl, either, for running away to town to get away from it? And yet only a coat or two of paint would work a great change. The old home would have a fresh, neat appearance.

PAPAYA.

(Continued from Page 581.)

seed from roundish, melon shaped fruits, which mostly grow on female plants.

All male plants should be destroyed wherever they appear, as not only are they unproductive, but by their pollen being carried to the fruiting plants they tend to produce degenerate plants when these are grown from the seed produced on plants growing in the vicinity of the male plants.

There is no need to fear that the other plants will not fruit if the male papayas are destroyed, for the reason that there are always plants about having perfect flowers and which provide sufficient pollen for the fructification of the female plants. This applies particularly to the Hawaiian papaya.

General Remarks.

The papaya is very impatient of water standing around the roots, and should be planted only on well drained land; being easily injured by strong winds, it should be planted in sheletred situations.

Keep the land clean of weeds and the plants well mulched.

Limited quantities of seed of a superior variety of papaya may be obtained, free of charge, upon application to the Director of the Bureau of Agriculture.

NEW TRAPPING LAWS.

The wide variation in trapping laws in various states makes it quite necessary for the trapper and farmer to be in close touch with game legislation at all times. The old saying that "ignorance of the law excuses no man" has caused regret in the heart of many only when it has been too late.

As a rule, the professional trapper makes it his business to become acquainted with all new laws regarding hunting and trapping, but there are many farmers and amateur trappers who are not as familiar with game laws as they should be.

These people will be glad to learn of a book which is now being distributed free by F. C. Taylor & Co., of St. Louis, Mo., the world's greatest fur house. This book gives game laws of every state in the Union and Canada. It also tells how and when to trap, what baits to use for various animals, and reveals some trapping secrets which have always been carefully guarded by trappers in the past. We suggest that those of our readers who are interested in hunting or trapping send for a copy of the book.

NON-PULSATING PUMP.

We call attention to the announcement of the Dow Pumping Engine Co., on another page.

The desirability of a non-pulsating type of pump is admitted by all engineers, and while the Dow Company has frequently been asked to market a non-pulsating pump, they refused because they believed such a machine, with the quality they demand in their standard pumps and compressors, could not be developed. However, after long experiments their engineers have at last devised a non-pulsating pump without the complicated gears and sliding connections usually found in such a machine.

We would suggest that our readers who are interested in deep well pumping, secure advance information regarding this pump, as when it is illustrated and the advantages it has over other pumps are divulged, the factory will undoubtedly be swamped with orders, and you are well aware of the inconvenience when everything is ready and you cannot get delivery on your pumping plant.

Questions and Answers

THE EDITOR AND STAFF

Cotton Seed Meal.

What value has cotton seed meal applied to field planted to onions? Onions just coming through. Soil is loose, sandy loam. Was in cantaloupes last spring, alfalfa five years preceding.—Subscriber, Imperial.

Cotton seed meal is a valuable fertilizer, but it must be borne in mind that it is not particularly quick acting. It requires certain bacterial action after it is applied to the soil. It is rich in nitrogen and contains some phosphoric acid and potash. Analysis of average sample shows one ton to contain about 100 pounds of nitrates. At 15 cents per pound this would be valued at $15. Of phosphoric acid it contains about 34 pounds, which at 6 cents would be valued at $2.04. It also contains about 30 pounds of potash, which at 7 cents a pound would be valued at $2.10; showing a total of $19.14. Note that the prices given may be somewhat low for material f. o. b. Los Angeles. In other sections these prices would vary slightly. Far more economical use of cotton seed meal is secured by feeding first to livestock and then applying the manure to the land. Fully three-fourths of the original fertilizer will remain in the manure.

Fumigating.

How long should a tent remain over a tree when fumigating for black scale? What quantity and proportions should be used on orange trees?—Subscriber, Alhambra.

Forty minutes to an hour is the usual time. If our subscriber will refer to our Spraying and Fumigation Calendar, issue of November 3, 1910, he will find under "Hydrocyanic Acid Gas": "The amount of chemicals necessary for success in fumigation varies according to size of tent, density of foliage and weave of cloth of which tent is made, but approximately we may say that one ounce of cyanide to each 100 cubic feet of space, exposed for one hour, is a reasonably strong dose. For black scale and similar easily killed insects, such a dosage is sufficient. The proportions are: Potassium cyanide, 1 ounce; sulphuric acid, 1 ounce; water, 3 ounces." If the subscriber wants more particular information he may secure it by writing to the U. S. Department of Agriculture, Department of Entomology, for Bulletin No. 90, Part One, "Fumigation of Citrus Trees," by R. S. Woglum.

Divorce.

If subscriber at Selma will write, giving name, it will be kept entirely private, but until name is sent, answer cannot be given.

Productiveness of Oranges.

What is the average number of boxes obtained from one orange tree at the age of four, five and six years? I mean under ordinary conditions. I have heard the claim made for twenty boxes on a six year old tree. It sounds pretty high to me, an Easterner just entering into this fascinating vocation. By boxes I mean picking boxes. How many picking boxes to the packing box? Wish this that I may figure out the profits at $1.50 per box.—Subscriber, Fresno.

Our subscriber is very wise to take with a grain of salt, even several grains, any twenty box claim for a six year old orange tree. Divided by four it will come nearer to the average, and even at that, or say, to be a little more liberal, six boxes per tree, there is big profit to the orange grower. The truth about California fruit is good enough. Three picking boxes are usually considered equivalent to two packed boxes of fruit. As a word of caution to our new subscribers we would suggest that the $1.50 per box also be shaded slightly. This has been received many times, and we trust will continue to be, but in figuring profits over a series of years $1.50 is perhaps a high average.

Wistaria.

Will wistaria do well where we have frosts and ice at times during the winter? Elevation is 2,130 feet. White honeysuckle does not freeze.—Subscriber, Hemet.

Wistaria will do well so far as the winter frosts are concerned, and we do not think the elevation would in any way be a detriment.

Pruning Apricots.

I have a young apricot orchard which has been top pruned every year. Have had good crops, except that this year there was none, owing to frosts. At pruning time this year should I thin out the tops by light pruning or not, leaving trees to be top pruned after next fruiting season? The trees are of the Tilton variety.—Subscriber, Selma.

We should certainly top prune the apricots. After a vigorous year's growth the limbs are reasonably sure to be long enough to give immense fruit bearing space, which would result in such a heavy crop that injury to the tree and inferior fruit would probably result. We have not had experience with the Tilton variety, but if the Royal, would prune off one-half to two-thirds of the past summer's growth. Will some of our friends who have grown the Tilton give us their experience?

Olive Cuttings.

What is the best time of the year for cutting "slips" for olive cuttings, and how should they be set? How will olives do in land which has water near the surface in winter? Will they stand more cold than oranges?—Subscriber, Porterville.

If by "slips" our subscriber means hard wood cuttings, any time during the next two months will be the proper time for making them. These may be of the size of a lead pencil or from that up to even stove wood size. Of course we would not recommend the latter, but say one-half inch in diameter, ten or twelve inches long, makes desirable cuttings. Possibly the subscriber means herbaceous tips, which are rooted under glass in sand. That is the usual nurseryman's method of propagating olives. The ripened wood cuttings, however, are easily rooted in ordinary sandy soil, buried two-thirds of their length, the same as grape or other cuttings are rooted. We would prefer better drained land. Do not think it would be well for olive trees to stand for any material length of time in water logged land. As to cold, the olive will perhaps stand more than the orange, but if the frost comes—as often it will—before the fruit is gathered, it is ruined for pickling purposes. The recent frosts in the San Joaquin Valley destroyed thousands of tons of pickling olives.

Dynamiting Vineyards.

Having seen much in the Cultivator about blasting ground, I will ask if it would injure grape vines to blast between rows which are ten feet apart. The soil is mostly sandy loam on top, with spots of hard alkali where vines will not grow at all. The loam is from

one to two feet deep; below that comes the hard Imperial clay strata, varying in thickness. How deep should the charge be placed in such ground? Will it pay to blast for field crops?

It is possible that by placing between alternate rows this year and the others the following year, no injury whatever would be done to the vines. The charge should be placed deeply enough so that a hole will not be blown out, only the hardpan broken and forced up sufficiently to allow more perfect drainage. If the alkali spots are partly caused by improper drainage, breaking up all the hardpan, allowing the alkali to be washed away by heavy rains will prove most beneficial. Be sure and place the charge underneath the hardpan. It will not pay to blast for field crops.

Muscatel.

Is the Muscat and the Muscatel grape one and the same?—Subscriber, Beaumont.

In most nursery catalogues we do not find the Muscatel given. Wickson's "California Fruits" gives "Muscatel, syn. White Frontignan," also "Muscatel Gordo Blanco." This is said to be not so long a grape as the Muscat of Alexandria. The book adds: "If the Muscatel would set as well as the Muscat, the difficulty would be obviated." From this we take it there is a Muscatel as well as a Muscat.

Eucalyptus Oil.

For what is eucalyptus oil given internally?—Subscriber, Artesia.

Eucalyptus oil is given internally as a tonic, and is also often taken for colds instead of quinine. It is usually administered in capsules or in emulsion.

Pecans.

I wish to plant pecans around farm. Will they do well in the Sacramento Valley? Can the trees be started from nuts and which is the best for this valley? Where may the trees be secured?—Subscriber, Chico.

As to whether the pecan will prove generally profitable in the Sacramento Valley, we do not believe any one is qualified to say at this time. They are being planted more or less in all parts of the state, but they are not the favorite they are in Texas and many parts of the South, but some which have proved to be desirable trees have been planted and have borne especially fine nuts. Profitable trees are now growing in Visalia and in your own town. This will give an idea as to whether they will do well in your section. About San Francisco Bay they have not as a rule proven profitable. So few of the trees have been grown that no market has been developed and it will not be possible to make a prediction as to their profitableness. The trees may be grown from the nuts if they are fresh. Of course one should secure varieties which are of highest quality and known to be good bearers. Then a small proportion of the trees may prove to be desirable and the remainder may be grafted. The nuts should be germinated and planted in a nursery row, and after the first year transplanted in orchard form. Some prefer planting nuts where the permanent orchard tree is to be, but we do not advise that method. Nurserymen advertising in the Cultivator can supply you.

Nitrate of Soda.

I have been advised to apply solution of nitrate of soda to my garden. What per cent should it be? Am told that nitrate of soda can be made from carbonate by treating with nitric acid. I have a spring which contains .0085 per cent carbonate of soda. Can that water be converted into solution of nitrate of soda?—Subscriber, Globe, Arizona.

We see no advantage in making solution of nitrate of soda for the garden. Simply sprinkle over the surface and work into the soil a little. For potted plants where it is desired to have it safer of application, one teaspoonful may be dissolved in a gallon of water. The waters of your spring can not be changed so as to make them beneficial. In fact they are so heavily charged with carbonate of soda—the black alkali, so destructive to plants—that you should not use it at all.

Trespassing Chickens.

If K. C. will send full name, will send former copy of Cultivator which fully answers.

Chick Feed.

Please give formula for making little chick feed.—Subscriber, Earlimart.

As a beginner you will do best by purchasing one of the standard chick feeds sold by the poultry supply houses advertising in our columns. Always remember that the greater variety of grains or seeds the better and stronger will be the chickens. Also when you want to stop feeding chick feed begin not by stopping the feed but by adding to it wheat and kaffir corn and keep increasing the quantities of these as the chickens eat it. Also give the little chickens plenty of green food such as lettuce, dandelions, cabbage and alfalfa.—Mrs. A. B.

Red Apples.

Mr. J. W. Gregg of the Gregg & John ranch on the Banning-Idylwild road, shows to us apples of remarkable beauty and quality. They are the Baldwin, the old timer, with a color of a deep red shading to almost a black. The Banning country is proving a remarkable apple producer and more extensive planting will doubtless be made within the next few years.

The Feed Problem.

I wish to make two inquiries to be answered through the columns of your paper. First, I keep white Leghorn hens and pullets for laying stock, and would like to know if you would advise keeping wheat before them at all times? Have a friend who has been

very successful with his Leghorn layers following this plan. Mine receive bran mash mixed with beet pulp and small quantity of egg-maker in the morning; green feed and table scraps at noon; and wheat in the evening; on cold days whole corn is fed at night in place of wheat. Once a week I feed green cut bone. There is plenty of grit and oyster shells in yard all the time. With this ration, what do you think of the wheat plan, or would it make the birds too fat. There are 42 birds in the enclosure, which is about 50x70. Second: In issue of Nov. 16, "Hatching and Rearing Turkeys by Artificial Methods," some statements are made directly opposite to the views of Mrs. Basley. Does this article apply more particularly to Southern California conditions, or would a modification be necessary?—Subscriber.

We would advise if you want to keep wheat before your Leghorns all the time that you feed it in deep straw in the scratching pen; by this means they will exercise for it and will lay many more eggs than if they can get it without exercise. Your plan of feeding is good and the only advantage in keeping wheat before them all the time would be to induce exercise. Second. There are many different ways of arriving at the same end. The only radical difference in feeding turkeys at the Washington Station from Mrs. Basley's method is that they gave them a little corn mixed with the other grains, but you will observe that the writer says, "The most surprising thing in connection with the feeding was the small quantity of these grains consumed, which was evidently due to the very liberal supply of milk and green stuff provided." These turkeys had the sense or instinct to take the green stuff and the milk in preference to the grains. Try both methods and then decide for yourself which suits this climate best.—Mrs. A. B.

Chicken Pox.

Swellings like little lumps have appeared on the heads of the Leghorns, which in time goes to their eyes and makes them blind. They would starve in time. We do not know what to do for it.—A. C.

It is chicken pox. The cure is to grease the spots with carbolic salve and give a little powdered sulphur in the food, not more than a quarter of a teaspoonful three times a week to each hen. See several of the recent Cultivators for a full description of this disease and the cure.—Mrs. A. B.

Gangrene of Ovaries.

We often find in dressing hens a number of little eggs or yolks will be very dark and hard like a piece of meat. Some hens have died from an inflamed condition, as we supposed caused by this. What is the cause, and is there a remedy? Seem very fat and well, but find them dead.—Mrs. G., Glendale.

The symptoms you describe are those of gangrene of the ovary. Dr. Salmon in his Diseases of Fowls, says, "The cause of this trouble is not well understood. It has been attributed to the birds being too fat, thus compressing the ovary and hindering the evolution of the ova. Death is caused partly by peritonitis and partly by the absorption of the products of decomposition." There appears to be no cure, but it is hardly found in birds that have plenty of exercise of scratching.—Mrs. A. B.

Roup—Wrong Ventilation.

Pullets have one eye swelled closed and cankerous substance around mouth. Is this roup? What is proper ventilation for houses?—Mrs. J. J. G., Acampo.

Your birds have either a severe cold or the commencement of roup. Swab the mouth with peroxide of hydrogen one day and the next with four grains of sulpho carbolate of zinc in one ounce of distilled water. In ventilating the house be sure to not have a draft. A draft in this country is certain to give swelled up eyes or head and colds of various kinds, and these colds are more or less infectious (as in the human family) so you did right to segregate the sick. I know there must be some drafts in your henery because otherwise you care for your fowls so well that they could not be ill. Arrange to have all the ventilation on one side so that there can be no draft over or on the fowls.—Mrs. A. B.

How Much Food.

What is the proper amount of mash for a hen, wheat being fed in the litter in the morning and mash in the afternoon? Is a pound of mash too much for a dozen hens? Also as to mating Orpingtons and Anconas. I have these two breeds, also Leghorns. Should dark hens be mated to light cocks or dark with dark, and light with light, to get the proper coloring?—C. M. T.

The feeding problem is one that puzzles many a beginner. I advocate the "full and plenty" method, but if you want to weigh or measure you can give one ounce per pound weight of a hen per day. That is, feed a hen that weighs six pounds six ounces of food. Another good way is to weigh out three ounces of grain or by-products for each hen. See how high that comes in your measure and feed that, adding to it the green food and the house scraps and one-half ounce of meat meal or beefscraps. Of course you know that a hen that is laying requires more food (to make the egg) than a hen that is not. A pound of dry mash would be about half enough for twelve Leghorns. The Standard requires the male of the Buff Orpington to be darker than the female. So if you are mating for males use the dark female, and vice versa. The Anconas mate according to the chart in "Western Poultry Book" and the Leghorns the dark males on the light females. Of course it would be difficult to tell without seeing yours what would be the best mating for you, but if you read the chapters on mating you can judge fairly well for yourself.—Mrs. A. B.

TRAPPERS GET BUSY

BIG MONEY IN FURS

Over ten million dollars will be paid to trappers of fur bearing animals during the coming winter. Any man or boy living in the country can add a goodly sum to his earnings by trapping during spare moments. We furnish ABSOLUTELY FREE a complete Trapper's Guide which tells you the size of trap and kind of bait to use for the different animals, how to remove the skins and prepare them for market. We also furnish the best traps and baits at lowest prices. We receive more furs direct from trapping grounds than any other house in the world, therefore can pay the highest prices for them. Our price lists, shipping tags, etc., are also FREE for the asking. If you are a trapper or want to become one, write to us today. We will help you.

WET WEATHER TALK.

It ain't no use to grumble and complain;
It's jest as cheap and easy to rejoice;
When God sorts out the weather and sends rain,
W'y, rain's my choice.

Men giner'ly, to all intents—
Although they're ap' to grumble some—
Puts most their trust in Providence,
And takes things as they come;
That is, the commonality
Of men that's lived as long as me
Has watched the world enough to learn
They're not the boss of the concern.

With some, of course, it's different—
I've seed young men that knowed it all,
And didn't like the way things went
On this terrestrial ball!
But, all the same, the rain some way
Rained just as hard on picnic day;
En when they railly wanted it,
It maybe wouldn't rain a bit!

In this existence, dry and wet
Will overtake the best of men—
Some little skift o' clouds 'll shet
The sun off now and then;
But maybe, while you're wonderin' who
You fool-like lent your umbrell' to,
And want it—out'll pop the sun,
And you'll be glad you ain't got none!

It aggervates the farmers, too—
They's too much wet, er too much sun,
Er work a waiting round to do
Before the plowin's done;
And maybe, like as not, the wheat,
Jest as it's lookin' hard to beat,
Will ketch the storm—and jest about
The time the corn's a jintin' out!

These here cy-clones a foolin' round—
And back'ard crops—and wind and rain,
And yit the corn that's wallered down
May elbow up again!
They ain't no sense, as I kin see,
In mortals, sich as you and me,
A faultin' Nature's wise intents,
And lockin' horns with Providence!

It ain't no use to grumble and complain;
It's jest as cheap and easy to rejoice;
When God sorts out the weather and sends rain,
W'y, rain's my choice.

—James Whitcomb Riley.

ALONG THE PERILOUS WAY.

How Shag, the Timber Wolf, Returned to the Home of His Youth.

The day was very warm for early May, and Shag, the big gray timber wolf at the street railway company's park, lolled lazily on the ground in the corner of his pen. Two feet behind him a coarse wire netting separated him from the adjoining coyote enclosure. Close to the netting were two coyotes, apparently lying, but in reality crouching, with their cunning yellow eyes fixed eagerly upon the hindmost parts of the big wolf. At length Shag gave a half roll and swung his tail backward against the netting. Instantly there was a double snap, as two sharp coyote snouts shot through the meshes and attached themselves to the timber wolf's tail.

Then the air was convulsed with terrible din. Shag freed his imprisoned member—or most of it; for coyotes have sharp teeth. His mate left her four little puppies, to join in the cause of her lord; and every coyote on the other side of the netting lined up and snapped and snarled and made faces in reply to the horrible growling and deep chested, hateful roars of the larger canine. Shag was furious, for before him was that one eared sniveler with the piece of tail still in his mouth. He especially hated that coyote, for he was the villain that only the day before had slaughtered one of Madam Shag's puppies, when the little fellow had inadvertently wabbled through the nettings.

Enraged beyond endurance, the big wolf sprang high, and then threw himself against the fence. To the surprise of the bystanders, of the coyotes, and perhaps more of himself, his legs stuck through the meshes, which were more open higher up, and he hung there. His hind legs immediately became the center of attraction for the coyotes, and they snapped and bit him cruelly. He drew them up and looked about him. He tried to free his front legs, and by working them one at a time he found himself climbing. He looked around him wonderingly, and then upward. He had solved the problem that had defied his wolfish brain for the three years of his imprisonment within those hateful wire walls, the problem that had kept that dreamy, vacant look in his pale eyes, as he used to lie motionless for hours, apparently seeing nothing.

One more effort, and he was teetering with his belly across the top of the fence, looking down upon the coyotes. They were not scrambling over each other now to reach him. Instead, they sneaked quickly about on low, crouching legs, with their tails out of sight, darting for this corner and that, and holding their cowardly eyes fixed upon the big gray figure above them.

Then the big wolf freed his hind legs, wabbled a moment, and fell into the coyote pen. One long growl of triumphant hate broke from him, as he arched his bristling neck and looked for that one eared coyote. A rush, a terrible chop, a few shakes, and it was over. He killed them all, six of them, and then he ran over and, in his delight, rubbed noses through the wire with his frantic mate.

But the cares of a father rest lightly upon a wolf at any time, and now Shag had other things to occupy his attention. Turning, and taking a flying leap, he again lighted on the fence, and began the repetition of his former exploit. Most of the bystanders scattered; but one man, with more courage than discretion, waited till the wolf reached the top, when he belabored him over his head with his umbrella. The brute growled wrathfully, but in spite of his punishment he did not retreat an inch. He rolled over the top, and fell with a heavy thump upon the outside railing. He contented himself with biting his tormentor twice on the part of him that was last in getting away; then the strangeness of his freedom impressed him, and he paused.

The thickets close by invited him; so he turned and slunk into the shadow of the hazel and poplar. He was no longer a captive, but a stalking, wary wolf, joying fiercely in his liberty. He slipped through the willows again, as he had done years before, during that first happy year of his life.

That night he stole out to the enclosure where the deer were kept. Hunger was urging him. But he found a dozen men patrolling the grounds, so he shrank sullenly back again.

TREES

Every Variety

suitable for planting in the interior valleys, coast counties and foothill regions. We are prepared to fill your orders for any quantity—large or small. LET US FIGURE WITH YOU.

OLIVES

There is a great demand for olives—far more than the supply—and prices are tip top.

Better place your orders now if you intend to plant. Trees are scarce and many contemplate planting. We have some of the finest pickling and oil sorts still on hand, and suggest that you get in touch with us at once.

WALNUTS

We call particular attention to the handsome returns that may be had from a walnut grove. The annual output in this state is far below the demand. As a permanent investment there is nothing in the nut line that is more profitable. We have growing in our nurseries the most elegant stand of walnuts we have ever been privileged to offer. These include:

Grafted Mayette
Parisienne
Cut-Leaved
Franquette

and many other commercial sorts. Also SEEDLING TREES OF SANTA BARBARA AND PLACENTIA PERFECTION.

Illustrated Price Catalog For 1911-1912 Now Ready

This year's edition of our annual price catalogue is now ready and we will gladly mail a copy free to anyone making application and giving a list of their probable requirements in nursery stock. It is profusely illustrated—briefly describes and prices all lines of stock carried by us. Burbank's very latest fruit introductions are also fully described.

WRITE FOR IT TODAY

Every planter should have a copy of our book—

CULTIVATOR PUBLISHING CO.,
115 No. Broadway,
Los Angeles, Cal.

Within him was an urgent longing to flee from the vicinity. A voice drifted out of the northward and called to him. He knew the direction. His animal senses and a hundred other signs all told him the way to the land of the maskeegs and jack pines, with silent, cool and shady retreats, carpeted with spongy moss. But across his path lay the city. He knew this by the sounds and smells that reached him with every breeze from the land of his birth.

All the remainder of the night he loped back and forth along the southern side of the city. Everywhere in his way were the habitations of men that he feared and yapping dogs that he hated. Nowhere could he find a place to break through. South of him ran the loop of the river; but he had no inclination to cross it. Northward was the call that spoke so strongly to his fierce, yearning heart, and he would obey.

When the light of early morning returned he stole back again and hid in the stretch of shrubbery between the park and the city. He was hungry, tired from his unusual exertions, and lame in the leg that had struck the railing in his fall. All day he lay, crouching at the sound of anyone approaching. No one molested him, however, and when kind darkness dropped down he came forth, a ravenous wolf bent on finding food. Urged by the gnawing pains of hunger, he skulked close to the buildings; but his attempts to kidnap dogs and cats were failures; and with the return of morning he was forced to skulk back to his old retreat. Now he was a more desperately ravenous wolf than before.

Early in the afternoon he heard sounds of men approaching. They seemed to be spread out to right and left, and were making a great noise. Every man now was a foe to Shag; so he slunk back farther for a new hiding place. His owners had sent men to beat the shrubbery; and the wolf now found that he was being driven back toward the park that he hated and feared. Suddenly one of the beaters was startled by a big gray shape, with an ominous growl emanating from it, that dashed past him through the willows. He fired immediately, for the orders were "dead or alive"; but his aim was poor.

Away through the friendly shelter dashed the fleeing wolf. In him was a great fear; for now he was hunted. Men and that detestable park pen were behind him; the city was before him. Beyond it, he knew, lay the land of his birth, of the jack pines and spruces and cool maskeegs; and they called to him. From the last clump of bushes he peered fearfully out at the city; then he dashed out, and fled down Lorne street, straight for the heart of it.

From behind him he heard a threatening rumble. The electric car was coming under all speed that the excited motorman could muster. But Shag ran for his life, or, what was dearer, his freedom, and he left the car behind. He fled past two dogs on the street, and instantly they were in yelping pursuit. More canines appeared every moment, and when the fugitive crossed the bridge spanning Clear Creek, after a half mile run, there were nearly a score of dogs in his wake.

Along the bank of the creek was a heavy fringe of willows. Shag dodged two astonished cyclists, several pedestrians and a delivery rig, and rushed into the sheltering willows. Some of the foremost of the dogs also went into the willows. Sounds of fierce fighting ensued, and when they came out again they were two less in number.

But a little crowd was quickly gathered, and when the wolf had recovered his wind he rushed out of the willows, crossed the asphalt pavement, jumped the opposite palings and slunk up along a row of evergreens adorning the grounds of a residence. There was a garden fete in session on the beautiful lawn, and the big gray fugitive went almost through the midst of the company. Without pausing to meditate on the consternation that he produced, he again took to the street. Soon there were dogs and more dogs after him, and he had to lope harder to keep ahead of even short legged terriers and squatty spaniels. He was not so terribly frightened now. His heart was becoming numb to such sensations. Anyway, none of the men or horses and drays or snorting automobiles had really hurt him. But that yelping rabble of dogs constantly following him was maddening.

Just ahead was Kennedy street, one of the main thoroughfares of the heart of the city. Across it, dodging an electric car, several rigs and an auto car, came the stream of canines, with the gray wolf in the lead. He was laboring hard; the stern race was telling on him. The chauffeur gave a shout, and, turning his machine, gave chase. In a few moments they were up with the wolf; but he turned in across the boulevards, and then sprang into a side lane, throwing off the men and most of the dogs. But two collies, keen and swift of foot, followed him, and, emboldened by the onslaught of a mongrel hound, they snapped at the wolf's rear. Some workmen near by ran across and with shout and gesture encouraged the dogs, and the fight was on. Once, and twice, the big wolf chopped and shook, and his enemies were two. A collie was as quickly put out of commission; then, to escape the missiles hurled at him, he put off again.

(To Be Continued Next Week.)

USEFUL HELPS IN THE KITCHEN.

A nice way to cook Irish potatoes so as to have them dry and mealy is to put them in a saucepan with just enough cold water to cover them, and let stand uncovered until the water becomes hot, then pour this water off and cover with cold water to which a little salt is added. In cooking prunes, the sweetness of the fruit itself is brought out by long, slow cooking, so that no sugar is necessary, and after washing and cleaning them thoroughly put in a kettle on the stove and allow three pints of water to each pint of prunes, and a slice of lemon added

before the prunes are quite cooked, is thought by many to be an improvement.

Put a pasteboard under and above the table when fastening the chopper or grinder on, and it will not slip or mark the table. Have a bag hanging near the kitchen table ready to receive small pieces of cotton cloth that are too small for other uses, as the clean, soft pieces can be used for wiping out nice dishes instead of scraping them with a knife, and use the small pieces for wiping the sides of the dishpan before you attempt to wash it, as the grease is hard to wash off and the pieces can be burned and the dish cloth can be kept clean twice as long.

Bread crumbs and pieces of bread dried in the oven and rolled fine can be placed in sealed jars and can be used for scalloped dishes, baked hash and in tomatoes and for thickening gravy.

When carving knives and forks and other nice steel knives are not to be used for some time, clean them well, and when perfectly dry, rub each blade with dry wood ashes; then wrap closely in thick brown paper and they will not rust for years.

To keep the inside of the coffee and teapot sweet and clean, boil borax water in them two or three times a week and place out in the sun and air for several hours. Glass and china can be kept bright and shining by washing through borax water without any soap, and then polishing with a soft cloth. The dish towels can be kept soft and white and will last twice as long if they are rinsed out in soda water after each meal and then boiled in strong borax suds twice a week. These suds soften and whiten the towels without any injury to the fabric, and when cleaned in this way they need very little rubbing, and it is the hard rubbing that wears them out much sooner than the using.—M. A. T.

PAPER BAG COOKERY.

The paper bag cookery, which has been the rage all over England for some time, has reached the United States and is taking the country by storm.

These bags were perfected by M. Soyer, a French chef, who experimented until he found a bag suitable in texture and strength and without any disagreeable features attendant upon the use of the ordinary paper bag.

These bags come in all sizes to suit different quantities of food. The bag is slightly greased on the inside and the meat or vegetable put in. Sufficient water to prevent burning or dryness is added unless one wishes a larger amount of liquid to serve with dish. The bag is then carefully sealed by folding over the mouth two or three times and fastening with paper clips. It is then laid on the grill or on a wire rack on the floor of the oven. The oven must have only moderate heat to insure best results.

M. Soyer has carefully worked out a time table for different meats and vegetables.

In serving, the bag is drawn carefully on the plate and then ripped open and discarded.

The claim made for these bags is that they not only do away with washing of greasy pans, but cooking in them preserves the natural flavor of the food. In vegetable cookery, this would mean a gain, as the valuable mineral matter which vegetables contain is thrown away in the stock.—Margaret H. Haggart, Colorado Agricultural College.

THE INEVITABLE TROUBLE.

I cannot run the old cars
I ran long years ago;
For they are so old-fashioned now,
And they're so awful slow,
I can't keep up to this year's pace,
They wouldn't stand the strain;
I cannot run the old cars,
Or take them out again.

I cannot run the old cars,
They aren't built just right;
The aspiration pipes get loose,
The carbureter tight.
The steering-gear declines to work,
The jump-spark will not play;
I cannot run the old cars,
They will not do today.

I cannot run the old cars,
They haven't any speed;
And all the fun is, nowadays,
The limit to exceed,
And so I have to stay at home,—
It makes me awful blue;
I cannot run the old cars,
And can't afford the new.

—Carolyn Wells in Harper's.

MOST UNKINDEST CUT.

With reference to the rumors of country "society" reporting, Mr. Melville Stone, of the Associated Press, tells of the account of a wedding published in a Kansas paper.

The story, which described the marriage in the usual flowery adjectives, concluded with this surprising announcement:

"The bridegroom's present to the bride was a handsome diamond brooch together with many other beautiful things in cut glass.

ABOUT THE HOUSE.

There are sometimes spots on the top of the stove that have become burned on so that the usual application of soap and water will not remove them. It is a good thing to keep a little emery paper on hand for this purpose, as a few rubs with a piece of it will soon remove them. It is also good for rust spots.

HIS CHOICE.

A boy went into a shop to buy a cent's worth of nuts. The man at the counter, a cheery, good-natured soul, said to him:

"You can have them—mixed if you like.

"All right," said the boy; "you may put one or two cocoanuts in, if you please."

HIS JUSTIFICATION.

"The trouble with you, Dobby," said Wilkins, "is that you bother too much over little things. It has become a habit with you."

"Well, it would become a habit with you, too, if you had a pair of three-months-old twins in the house," retorted Dobby.—Harper's Weekly.

FRATERNAL AFFECTION.

Recruiting Sergeant: Why do you say you won't enlist unless you're sent to the Seventy-fifth Infantry?

Tim Geoghegan: Beca'se I want to be near me brother that's in th' Seventy-sixt.'—Harper's Weekly.

A WOOLY TALE.

Mary had a little lamb.
She bought the "critter" cheap.
In five years she owned a farm,
Just through raising sheep.

—Chas. H. Meiers.

To keep the rug in place in front of the door, sew a brass ring on each of the corners nearest the door, and slip these over brass headed tacks that have been fastened to the floor where needed.

Mayer HONORBILT SHOES

These shoes combine style, refinement, comfort, service and high quality. for Men Women and Children

Mayer Honorbilt Shoes are not only stylish looking, but dependable for wear. They are "built on honor."

The choicest leather is selected for the uppers, the soles are of special tannage, the materials and workmanship throughout high-grade. Cannot be equalled anywhere at the price. If you want the dressiest and best wearing shoes obtainable, demand Mayer Honorbilt Shoes.

WARNING—Look for the Mayer Trade Mark on the sole—if your dealer cannot supply you write to us

We make Honorbilt Shoes for men, women and children, including "Leading Lady" and "Special Merit" brands—also Mayer "Yerma Cushion" and Mayer "Martha Washington Comfort Shoes."

FREE OFFER—Send the name of a dealer who does not handle Mayer Honorbilt Shoes—we will send free a handsome picture of Martha Washington—size 15x20.

Hay.

Scott, Magner & Miller say:

Arrivals of hay during the week have amounted to 2,200 tons. The lessening of arrivals has been due to the fact that consumers here apparently are not ready to pay the advanced prices, and also to the fact that the weather remaining dry in the country has caused an active demand from many of the interior sections.

Somewhat of the above arrivals have consisted of river alfalfa, which is now all practically taken care of, and there will be very little to come from the river districts from now on.

Market during the week has been strong. An advance has taken place in some of the medium types, and the entire line shows a strength that is thoroughly justified by the situation. We are now in the month of December, with no rain having fallen. There is no pasture in the country, and cattle, horses and sheep will have to be fed. Even if we have rain now, followed by the usual December frosts, feed cannot be expected to start satisfactorily. These conditions now being thoroughly understood have caused a hardened market with a strong tendency for advancing figures.

Trade in the city has been quiet. There is some demand for shipments along the coast, and we are now having considerable inquiry from many points.

Alfalfa has made a decided advance, due to country demand.

A little choice barley straw has come in during the week, and has sold at top figures.

Deciduous Fruit Market

F. B. McKevitt, manager of the California Fruit Distributors reports:

Sacramento, Dec. 2, 1911.

The following gives number of cars of deciduous fruit shipped from all points in California for the week (7 days) ending Friday morning, Dec. 1, 1911:

Grapes—38 cars. Movement of this fruit during the week has been about as expected. While it shows a total of 38 cars, a considerable portion of these had moved out before our last letter was written, but appeared in subsequent reports received from the railway companies. It is believed that the shipment is now entirely completed, although there are probably a few cars which will yet appear in the railway reports. The last car of Emperors left Vacaville on the 28th and the same day closed the shipment of this variety at Mills.

This is the last report that will be issued by us during the present season. Reference to the table below, which has been brought up to date, will show the shipment so far as reported for the entire season. From this it will be seen that the movement has been much larger than last year when we consider that this season each car contains thirteen tons, whereas in 1910 the minimum was twelve tons. The season has been an erratic one, ranging from the highest prices ever known in the California fruit business, and which continued well into August, to the lowest general range in the history of the business. We believe the trade this year has been more generally unsatisfactory to shipper and dealer than any other of which we have knowledge. It is to be hoped that the same conditions will never again prevail. We are looking forward to a satisfactory crop of fruit in this state for the coming season bud development being all that could be desired.

Comparative Statement of Car Lot Shipments up to December 2.

	1910	1911
Cherries	250½	216¼
Apricots	289¾	214½
Peaches	2517¾	2027
Plums	1552½	1366
Pears	2361	2324¾
Grapes	4944½	6369½
Sundry	17	16¼
Total	11,933	12,534¼

Citrus Fruit Market

LOS ANGELES, Dec. 6, 1911.

Nicer holiday fruit never went out of California than has gone forward this year. The shipments will be almost entirely from north of Tehachapi, although Southern California has forwarded well up towards 150 cars. This for the South is about a third of last year's shipments at same date. The rain which is falling as we go to press will lessen, if not cut out entirely, any further Southern California shipments for the holiday trade. Tulare and Butte Counties' fruit is not only of good quality, but exceptionally satisfactory as to sizes. The tone of the lemon market is decidedly easy, as was expected at this time of the year.

Shipments.

Shipments of oranges from Southern California to date since Nov. 1, 161 cars; lemons, 501; total, 662. To same date last season: Oranges, 733 cars; lemons, 499; total, 1,232. Tulare County shipments we have no report of since Dec. 1. Up to the night of that day the total was 1,305 cars of oranges; lemons, 53; total, 1,358. To same date last season, 1,554 cars of oranges; lemons, 53; total, 1,607. Butte County's total to same date was 183 cars of oranges. To same date, 1910, 271 cars oranges.

LOS ANGELES, Dec. 4.—Three cars navels and three cars lemons sold.

United, fy. or.. navels, Orange, Dec. 2 to Kansas City	$1.75
Dulce, sd, navels, Orange, Dec. 2 to Kansas City	1.30
Lone Palm, fy, or, navels, Santa Ana, Dec. 2, to Kansas City	1.72½
Beach, sd, navels, Santa Ana, Dec. 2 to Kansas City	1.42½

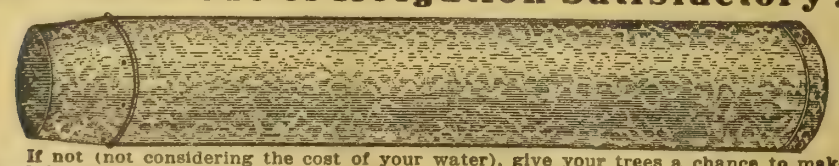
Is Your Mode of Irrigation Satisfactory?



If not (not considering the cost of your water), give your trees a chance to make good by giving your orchard the proper amount of water all over same, and not three-quarters of your water supply within forty feet of your head flume.

The surface irrigating pipe we manufacture will remove this obstacle—will cut your water bill—is more convenient to use and will last a life time.

Write us, stating your requirements and we will cheerfully furnish you with prices and information desired.

We also manufacture Ells, Tees and Gates for this special pipe and are in a position to manufacture any special fittings you may require.

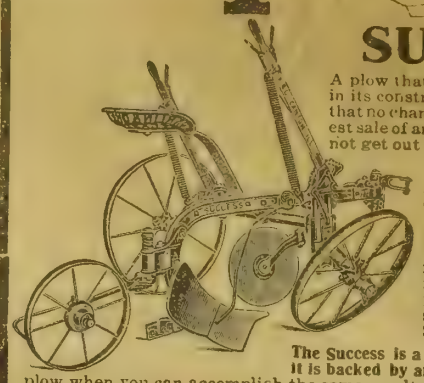
P & O



SUCCESS PLOWS

A plow that has been on the market for years without a change in its construction; a plow that was so well built at the start that no changes have been necessary; a plow that has the largest sale of any riding plow made; a plow that is so simple it cannot get out of order, so strong that it lasts a lifetime—

Such is The Success.

It has the strongest and simplest frame ever put on a riding plow; the best hitch, the best landing device, the best rolling cutter, and bottoms ever made. It has but two levers, but they give the same wide range of adjustments as plows with three or four levers The **Success** is heavier; it has more material, but fewer parts, and therefore less complicated, than others. That is why it is simple, strong and durable. That is why we call it the **Success.**

The Success is a medium-priced plow that will work anywhere, and it is backed by an unqualified guarantee. Why buy a high priced plow when you can accomplish the same results with the Success, a medium-priced plow?

When so ordered, we furnish Alfalfa Shares, which are broader than the ordinary shares.

Insist on getting **P. & O.** Canton Plows, Harrows, Planters, Cultivators, Potato Diggers, Stalk Cutters, etc., from your dealer.

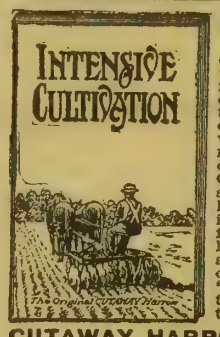
Pioneer ROOFING

Always dependable—never disappoints. The one Ready Roofing that is right for any building. Made in three weights. Meets every roofing requirement. First cost the only cost. Needs no paint or repairs. Lasts for years. Handy rolls—108 square feet. Everything necessary for laying—nails, cement, etc—in core of each roll. Anyone can lay it. Let us send you samples—and our 32-page Roofing Booklet.

PIONEER PAPER CO., Los Angeles, Cal.

Address Department 11 Pioneer Roofing is for sale by Leading Dealers in building materials everywhere.



HARROWS AND CULTIVATES.

With Clark's Original "Cutaway" Double Action Harrow and Cultivator you can do more different kinds of work with less effort than any other. It is the only Disk Cultivator that completely embodies the double action principle. It will do the work of several other disk machines that would cost you several times as much; do it more thoroughly, because it has 4 gangs instead of 2. Cuts the soil twice, throws in opposite directions, fills the hollows, leaves land level and true. The draft is always from the centre—suitable for light team. All single action harrows run in half lap. Gang frame adjustable for cultivating rowed crops. Jointed pole. We make a "Cutaway" for every crop. Send today for our new catalogue, "Intensive Cultivation." It's Free.

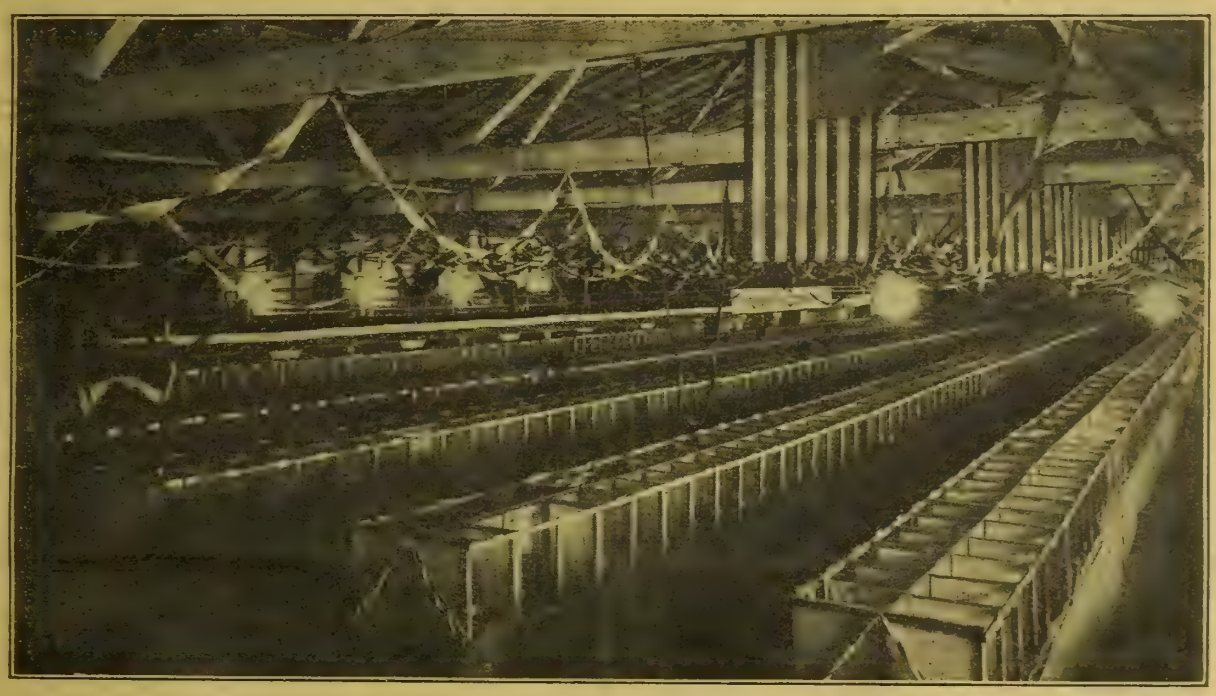
LOS ANGELES DECEMBER 14, 1911 SAN FRANCISCO

A Poultry Show in the White Leghorn City



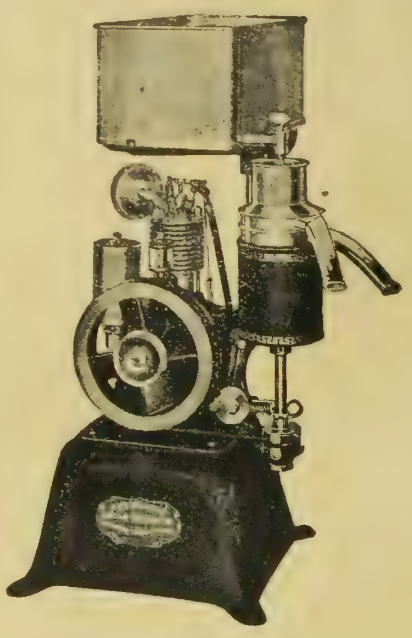
PETALUMA.

Petaluma, in Sonoma County, California, has a population of 10,000, is situated only 37 miles north of San Francisco at the head of navigation on Petaluma River, on the line of the Northwestern Pacific Railway, and is the terminus of the Petaluma and Santa Rosa Electric Railway, extending northward to Sebastopol, Santa Rosa and Forestville, reached by two steamers daily to and from San Francisco. It is the greatest poultry center on earth. It markets 100,000,000 eggs in one year. Hundreds of poultry ranches dot the surrounding country. They range from 2 to 160 acres. An average of 400 hens can be kept on an acre.

The Petaluma River ranks second among the navigable streams of the state. The imports and exports by river and rail for 1910 amounted to 400,000 tons at a value of about $20,000,000.

The Automatic Cream Separator

Crankless and Gearless



Nothing like it has ever before been invented. One size machine for any size dairy. The drudgery of dairying now a thing of the past.

It separates the milk perfectly faster than ten men can milk it.

Start the separator when the milking begins and it being both automatic and continuous in its operation, when the farmer is through milking he is through skimming.

Speed of bowl brought up in 15 seconds and will run for hours without the slightest variation.

It is destined to revolutionize the dairy business.

We are at least FIVE YEARS ahead of all competitors.

The Greatest Labor-Saving Machine of the Twentieth Century

NOTE: The AUTOMATIC Separator has been in use several weeks at the University of Illinois, Champaign, Ill., also the University of Ohio, Columbus, Ohio, where it amazed the faculty and surprised the students taking the Dairy Course, by its simplicity of construction, superior work and ease of operation.

Standard Separator Co., Milwaukee, Wis. Ottawa, Kans.

Gentlemen:—

We have just completed a thorough test of your AUTOMATIC Cream Separator and are pleased to report the following results:

FIRST TEST:

Temperature milk	74 deg.
Cream test	34%
Skimmilk	.005

SECOND TEST:

Temperature of milk	74 deg.
Cream test	52%
Skimmilk	.02
Indicated capacity	738 lbs.

All the tests were made by the Ottawa Condensing Company. Considering the fact that the milk was a mixture of the night's and morning's milk and the temperature low, we consider the foregoing results remarkable and indicating a very high efficiency in your machine.

Yours respectfully,
(Signed) H. B. CROSSGROVE.

Citrus Trees

First Quality Trees will be Scarce in 1912

A block of 20,000, one year old buds. First Quality Trees. Free from scale— (no scrubbing) ***mostly 5/8 and up now***

THE MAN WHO WAITS is generally the disappointed man.

BUY NOW, WHILE THE GOOD STOCK IS AVAILABLE. It will cost you no more and probably less than if you wait until Spring.

THE BEST ARE CHEAPEST. First-class groves have never been made out of sickly seedling trees. That few cents per tree saved at time of purchase often shows dollars per tree loss in after years.

BUY THE BEST; IT PAYS. We have got a limited number of trees to offer for the season of 1912—

Eureka and Villa Franca Lemons. Washington Navels.
Valencias and Marsh Seedless Grape Fruit.

Ninety per cent of our trees are strictly first-class, strong, one-year-old buds, the majority of which will measure 5/8 inch and up now on sour stock roots. True to Name, and the buds of which were carefully selected from the best fruiting trees. They have been carefully grown, are straight and entirely free from scale (no scrubbing). We invite inspection and solicit correspondence.

We will sell these trees at current prices. Expenses refunded to out-of-town purchasers. Twenty years' experience in expert citrus horticultural work.

Vol. XXXVII. No. 24. LOS ANGELES: THURSDAY, DECEMBER 14, 1911 One Dollar the Year

The Annual Poultry Show at Petaluma

Petaluma's Prize Poultry Proudly Preens. Pleased People Praise Pampered Pets of Poultrydom

There is no city or section of California that so specializes upon one product as does Petaluma on Poultry.

Men are not long in discovering where Nature has her preferment for the production of certain commodities, and the early settlers soon determined that Sonoma County and particularly that part of it which adjoins the present City of Petaluma, was a place where poultry would thrive in a manner to bring home the golden harvest in bountiful measure.

Climatic conditions are favorable. Fogs do not carry their depressing influence; rains do not flood the land, and winds do not blow destructively. The soil is a sandy loam. This at the outset gives ample opportunity for the scratching proclivities of poultry. The rolling country furnishes ample drainage and makes an ideal section for poultry raising.

Aside from these the transportation facilities to the greatest egg and chicken market in California are so perfect that freight rates are reduced to a minimum. It is but natural then to expect that Petaluma, so favored by the elements of success, should grow and prosper. It is but natural also for a degree of perfection which can only come from quantity under the most auspicious environments.

Each year Petaluma shows to the world the best of her feathered tribe, and he who has formed ever so high an expectancy is not disappointed.

The practical men of Petaluma, and there are many of them, realize that criticism will be severe where so much is looked for. They recognize that in their show is found a model for other similar exhibitions throughout the state. They are equal to the occasion. At the hour for the judging to begin, which was the day before the show opeend, every pen had its occupant, every table had been built, every yard of bunting was in place, every light had been tested; all was ready.

Much credit should be given the management for the excellent business organization, which a mere casual observer could see, was back of the show.

The photograph on the cover of this issue gives a general idea of the arrangement and illustrates the proper method of display. Every bird could be seen and appreciated in full measure. Every aisle was ample for the accommodation of the vast throng that attended. The lighting facilities were perfect both day and night. In short, the entire arrangement showed much forethought and painstaking effort to present a show which would be long remembered as the epitome of perfection as to quantity, quality and the method of display.

To enumerate the excellencies of the birds and point out specific superiority would be to traffic with the possibility of omitting well-deserved praise, and we deem it best to publish the awards as made by judges R. J. Venn and H. H. Collier, and ask the indulgence of our readers in not commenting upon individual displays.

The following is a list of the awards:

AMERICANS.

Barred Plymouth Rocks—Pen, 1, K. P. Sabin; 2, B. S. Kennedy; 3, Thos. A. Atkinson; ck, 1, L. N. Cobbledick; 2, E. P. Sabin; 3, Mrs. Cecelia Felt; ckl, 1, L. N. Cobbledick; 2, 3, E. P. Sabin; 4, L. N. NATIONAL QUARANTINE LAW.

By Prof. A. J. Cook, State Commissioner of Horticulture.

One of the most important necessary measures to come before the next session of congress is the national quarantine law. The first bill advocating this measure was introduced in the year 1897 unsuccessfully. This was followed by another attempt in 1899, and still another in 1907, the opposition in every case being stronger than the support. The last measure was opposed because it contained the following regulations: 1. That all introduced stock should be inspected at the port of entry, rather than at the port of destination. 2. That districts known to be infested with fungoid diseases and insect pests not known to exist in this country be strictly quarantined, and all stock from these localities prohibited.

The first point was changed to suit the American Association of Nurserymen so as to make the inspection of imported nursery stock at the port of destination rather than at the port of entry. While this reading of the law may save considerable to the nurserymen who are heavy importers of foreign stock and those interested merely in the importation of cheap plants, yet it is a point open to very serious objections. According to the ruling a shipment of trees from Hawaii, or any plants carrying the Mediterranean fruit fly, and destined to some interior town in California could not be inspected at San Francisco, the point of entry, but must first go to its destination and if found infested destroyed there. In this case, it is very possible to have distributed the fruit fly from San Francisco throughout the country through which the railroads pass, while if the inspection was made at the port of entry, and the infested shipment destroyed, the danger of infestation en route to its final destination, would be impossible.

Similarly a shipment to California from Europe—say of brown-tail moth—by way of New York, would not be inspected until it reached California, which would give ample time for eggs, larvae or pupae to develop and escape en route before it arrived in our state. If the shipment was then found infested, the destruction of property would come only after the heavy expense of shipping the stock entirely across the continent. This would certainly not benefit the nurseryman making the shipment. This latter case is not exceptional, for we have frequent shipments from France and are in constant danger of importing the Brown-tail and Gypsy moths. Such procedure will do away with our strict quarantine service at San Francisco, and certainly make the introduction of the Mediterranean fruit fly and orange maggot much easier than it now is. While this point is objectionable in itself for the above reason, it is greatly dependent upon the next point, which places a strict quarantine on districts known to be infested with such disastrous pests.

The leading entomologists of the country are emphatically set against any opposition regarding the establishment of quarantine districts as referred to above.

When we stop to consider that fifty per cent of all our injurious pests are from foreign countries and that this fifty per cent includes such insects as the Hessian Fly, Codling Moth, San Jose Scale, Gypsy and Brown-tail Moths, Cottony Cushion Scale, Cotton Boll Weevil, the Alfalfa Weevil, and many other important pests, and that the annual cost for fighting injurious insects in the United States reaches $1,000,000,000, we get some idea of the value of keeping out those pests that are now knocking at our very door.

Besides the dreaded insects named above which are seeking some means of entry we must include two fungoid diseases, the Potato Wart and the White Pine Blister Rust. The former is as close as Newfoundland, and is so serious a pest that it almost entirely wipes out the potato industry without any apparent means of control. The White Pine Blister Rust attacks the young pine seedlings and greatly impairs the building up of national forests. From a commercial standpoint this is as much to be dreaded as the Potato Wart.

During all of the past years of national quarantine education California has had but a small part to play in the endeavor to secure a national law, consequently some of the provisions of the proposed law do not give this state the protection which it should claim. While a national law may aid us materially in the examination of certain classes of personal baggage, yet it would be a great menace if it did not provide for quarantine districts in foreign lands and at home and allow the inspection of foreign plants to be made at the port of destination rather than the port of entry as was pointed out above.

The necessity of a suitable national quarantine law (one which will thoroughly protect) is made apparent by the fact that at the present time the neighboring states of Oregon, Washington, Nevada, Arizona and the Republic of Mexico have very inadequate or no quarantine laws at all, and the introduction of pests across the borders is only checked by our own state laws. But even these state laws do not protect us from the importations in personal baggage, especially by way of rail from Mexico, and our neighboring states. A uniform national law embodying the spirit of our own state laws, such as it does, and providing for quarantine inspection at the port of entry rather than at the port of destination and imposing strict quarantine upon localities known to be infested with destructive pests and diseases, will mean more to the agricultural interests of this country than perhaps any other one act which could be enacted at the present time. Especially should California be represented in the making of this law. Every influence from our state legislature, our representatives in congress and all agricultural organizations and the leading fruit men should do all in their power to exert some concerted action to aid in the passage of a national quarantine law.

This office is now endeavoring to get some such action from the state legislature which will show that California is not only interested in this law but that it is willing to do all in its power to assure its passage.

I will govern my life, and my thoughts, as if the whole world were to see the one and to read the other; for what does it signify to make anything a secret to my neighbor when to God (who is the searcher of our hearts) all our privacies are open?—Seneca.

You Can Feel Safe

when driving home at night if you use a Rayo road lantern.

Its strong, white light reveals the road ahead; the ruby disc in the reflector is a warning in the rear.

It is attached to the vehicle by a simple bracket. Lift it off, and you have a first-class hand lantern.

Rayo lanterns are made in numerous styles, sizes and finishes. They are the strongest and most reliable you can find, and **will not blow or jar out.**

All Rayo lanterns are equipped with selected Rayo globes, clear, red or green, as desired. Wicks inserted in burners, ready to light.

NATIONAL QUARANTINE OF NURSERY STOCK.

Below we give the gist of the proposed bill now before Congress aiming at national control of imports and interstate shipments of nursery stock. The bill, if passed, is to become effective July 1, 1912.

It shall be unlawful to import or offer for entry into the United States from any foreign country any nursery stock until a permit shall have been issued therefor by the secretary of agriculture, and unless such nursery stock shall be accompanied by a certificate of inspection from the proper official of the country from which the importation is made to the effect that the stock has been inspected and found free from injurious plant disease and insect pests.

No person, firm, or corporation shall import or offer for entry into the United States any nursery stock unless the case, box, package, crate, bale, or bundle thereof shall be plainly and correctly marked to show the nature and quantity of the contents, the country and district where the same was grown, the name and address of the shipper, owner, or person shipping or forwarding the same, and the name and address of the consignee.

Explanation of Provisions.

Section 1 provides for importation of nursery stock by the same permit system which has been found perfectly satisfactory in relation to the importation of domestic animals. A certificate of foreign inspection is also required, and, while such certification has not in the past been a guaranty of much value, the agitation of the last two years has given it a much greater value from the European countries from which the bulk of stock is imported, and after the passage of this desired legislation such foreign inspection will doubtless be made so thorough that there will be rarely, if ever, occasion to apply the coercive measure of quarantine. This section has further been amended so that it will not affect importations of plant products solely intended for food, and provides for importation of plants for scientific purposes, and also makes provision for importations from countries where no system of foreign inspection and certification is at present possible.

Section 2 is a section of notification, and is designed to afford the government accurate information covering every package of nursery or other plant stock imported for propagation. On the receipt of imported stock at customs, notification is to be made by the agents of the treasury department, and subsequently notification is to be made by the broker or other receiver, and finally by the common carrier before transportation is begun. The information thus gained, which puts no unreasonable burden on the importer, will be transmitted at once to the state officials charged with inspection, and will enable full advice to be given concerning all imported stock showing origin and destination. It will eliminate the present danger that much imported stock is unreported and uninspected.

Section 3 provides merely for the labeling of imported stock as a condition of entry.

Section 4 is similar to section 3, and provides for similar labeling as a condition for interstate transportation.

Section 5 provides that the secretary of agriculture shall make such rules and regulations as may be necessary for carrying out the purposes of the act.

Section 6 makes provision for quar-

Deciduous Fruit Culture

SUGGESTIONS ON THE STORAGE OF APPLES.

By Ernest Walker, Professor of Horticulture, Arkansas Col. of Agr.

(The following is from an Arkansas standpoint, but it has many valuable suggestions for the California apple grower.—Ed.)

Formerly, before the day of the large commercial orchard, and the refrigerator car, when the growing of apples was largely a matter of home supplies and local marketing, it was common to keep a supply of apples for winter use or store the surplus fruit in the common cellar. Again they were kept in piles in the open, placed on some inches of straw, covered with straw or leaves, boards, and several inches of soil. With good keeping varieties, reasonable pains, and a cold winter, this plan was very successful. Many of us remember the relish with which we ate those mellow frosted apples with their faint earthy flavor. The practice was, of course, better suited to northern climates than to warmer. The common cellar was also used to keep apples, but the fruit sometimes decayed early and badly owing to seasonal conditions, the way handled, and to various other causes. One of the chief sources of trouble, however, arose from an imperfect understanding of the principles involved in keeping fruit and in the management af the cellar. The notion prevalent was that the cellar is for the purpose of keeping cold air out, and to protect the contents of the cellar against freezing. At the North and during severe weather this is true. In milder weather, however, and southward, where the winters are mild, the reverse is true, the point under these conditions being to keep cold air in, and by careful attention to ventilation during cool weather and of nights to cool the interior of the cellar and its contents and maintain as far as possible a uniformity in the inside temperature. This uniformity, observing ones learned, had more to do with keeping apples successfully than the actual temperature itself. The latter might be a few degrees warmer or cooler, as the case might be, with less danger to the fruit than follows sudden variations.

Preserve Regular Temperature.

Once chilled, any subsequent rise in temperature causes the fruit to sweat from the deposit of moisture from the air on the cool surface of the fruit, hence a rise in temperature is more to be guarded against than the contrary. Since in ordinary storage it is commonly impossible to maintain a wholly uniform temperature, the thing then to do is to avoid sudden changes. A cool air free from excessive dampness, as much uniformity in temperature as possible, and darkness, are the conditions favorable to the keeping of fruit in ordinary storage. A well insulated door and a well insulated vestibule entrance to the cellar make it much easier to prevent sudden changes and contribute greatly to prolong the period through which fruit may be kept in sound condition.

It is desirable also to enter the cellar as little as possible except when the outside temperature is lower than that within. It is obvious that the apple cellar gives better results when wholly separate from the room in which ordinary preserved or canned fruit is kept.

It Breathes.

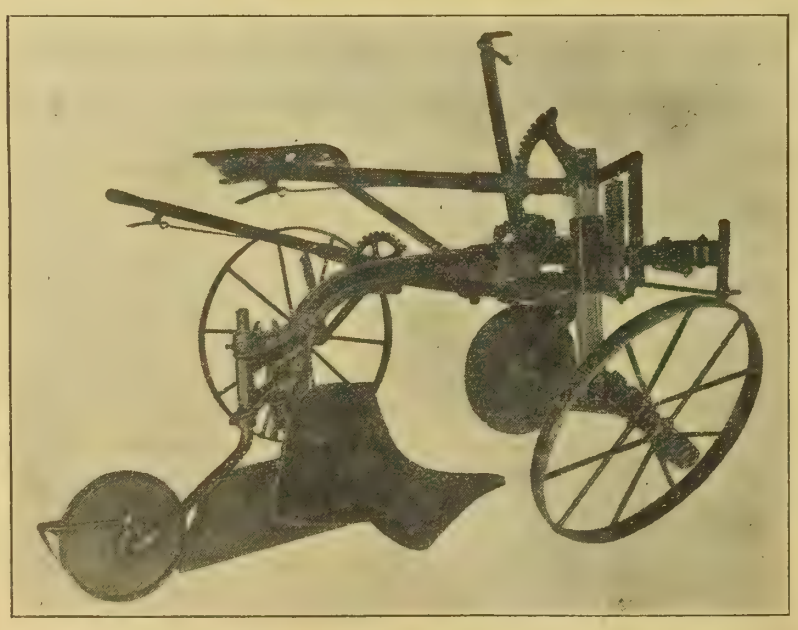
The apple is a living thing. It is taking in oxygen and breathing out carbonic dioxide as a result of the chemical processes going on in its tissues. These changes go on both before and after it is picked. They are more rapid in summer temperatures and slower in lower temperatures, although they do not cease even at the temperature used in cold storage rooms, which is near the freezing point. Different varieties show great differences in the rate at which these changes proceed under given conditions, consequently vary greatly in keeping qualities. The degree of maturity also is a determining factor. Apples which are allowed to mellow on the tree or after they are gathered have their life period greatly shortened. Yet there are no advantages to be derived from picking fruit green. The ideal stage is when the fruit is full grown, but some days before it would begin to show signs of mellowness. Other points to be observed are the selection of late maturing, good keeping varieties, and gathering the fruit in cool weather, or late in the day, when it can stand open all night to be chilled before going into the cellar. A common practice formerly was to pile the fruit in the shade in the open air or in a freely ventilated building before placing it in storage. This was for the purpose of allowing it to go through a so-called "sweat." This process was thought to improve color and favor a slight shrinkage, also a toughening of the skin. It also allowed such specimens as were not in sound condition or too ripe to develop signs of decay.

The pile was then sorted over one or more times, leaving only the sound fruit for storing. The latter result was no doubt of more real value than the so-called "sweat," as we know that diseased or scabby, or fruit showing mechanical injuries will not keep well under any conditions. Cold arrests the activities of most of these organisms present, but one of these fungi at least works even at temperatures near the freezing point. The location of the cellar on a slope or hillside to the north, with openings up and down the hill, favors free and thorough ventilation during cool nights. By opening the cellar early in the night in cold weather and closing the doors before sunrise the cellar is cooled and the cold air is kept caged in. Under ordinary seasonal conditions the cellar so managed keeps fruit fairly well. The essential idea is in keeping the cool air in, rather than in keeping out warm air or protection against freezing, and maintaining as equable a temperature as possible by careful attention to ventilation. By these methods the writer has seen apples kept in cellars in Northwest Arkansas with fair success till the latter part of January. Here, however, owing to the elevation, the climatic conditions are in many respects similar to those of points considerably northward. In the less elevated or the cotton section of the state, the attempt to keep apples out of cold storage would likely result ordinarily only in complete failure. Even in the elevated sections ally continues quite high for some weeks after gathering, which augthe temperature at gathering time usuments the difficulties. If by means of a few tons of ice the temperature of the cellar and the apples could be promptly cooled, the uncertainty of keeping apples till midwinter or possibly later would be greatly reduced, as this prompt cooling is very important in retarding the ripening process and lengthening the keeping period.

Handle Carefully.

It is not advisable, however, to attempt the storage in common cellars of large quantities of fruit intended for shipment in late winter. It is too big a risk for the grower; nor is it necessary, since in most localities where apples are grown commercially ice manufacturing and refrigeration storage plants of large capacity are

DEEP PLOWING



surely increases crops and insures crops under adverse climatic conditions. It is recommended by every agriculturist connected with beet sugar companies in California, and every contract requires it. Every bean raiser knows it is essential to success.

Webster says that plowing is "the act of **TURNING UP** the soil with a plow." The words "Turning up" mean an act which not only loosens the soil but by "Turning" mixes it so as to secure the benefit of its chemical elements.

The Egyptians farm a rich silt renewed each year by the Nile overflow They have continued using the same kind of sharp stick which their forefathers used. It loosens their soil which does not need mixing.

Our farmers have always used plows which have both loosened and mixed the soil to their depth capacity. The factories and farmers have tried to adapt these moderate depth bases to deep plowing by lengthening and raising the moldboards. Such changes allow the share to be set to the required depth, but, like the Egyptian's stick, it is merely a shover; it does not turn or mix the soil.

The Oliver Chilled Plow Works and ourselves have spent, during the last four years, a great deal of time and thousands of dollars in experimenting with different new shapes in plow bases. We have found the proper shape for deep plowing and offer in the Sulky shown in this cut not only the latest and best, but also THE ONLY PLOW WHICH WILL TURN AND MIX AS WELL AS LOOSEN THE SOIL TO THE DESIRED DEPTH.

Field demonstrations will be made during a short introductory period only. Write us at once and learn where you can see this plow actually do the work.

within reach of the grower. These plants furnish a low and uniform temperature and are capable of holding sound fruit of the better keeping varieties in perfect condition till the following April or May. But right here is a point for the grower to carefully note. Fruit does not keep in cold storage satisfactorily unless it is carefully and properly handled by the grower before sending it to the storage room. Growers are constantly making serious mistakes in the matter of storing fruit, and to some of these I wish to call attention and emphasize.

Don't Store Poor Stuff.

In the first place it does not pay to store inferior grades of fresh fruit for marketing, no matter how short the fruit crop may be in your section. Such fruit does not keep well, and in the next place it is a blunder to try to get the public to pay a good price for poor fruit. In 1907, misled by reports of a short crop and the prospect of high prices, growers stored vast quantities of stuff not entitled to rank above the grade of culls. It began to "go down" shortly, and was rotting, and shrinking to the extent of 30 or 40 per cent by January. In some cases the entire quantity rotted by March, and the grower was out the cost of cratage, freight and storage above the loss of his apples. It does not pay.

Grade.

Grade the fruit according to size, color and quality, and pack so that the contents of packages are the same from top to bottom. Mark and sell according to grade. And (if the conditions seem favorable) store only the best grades. But don't store even these grades if the price at the orchard is fair and you have an offer at a reasonable price. Let those who have the capital and who make a specialty of storage take the risks, unless you are carefully studying the fruit supplies and markets over the whole country. It is in essence simply a form of speculation, a gamble, although possibly an intelligent one, that the price of fruit will advance after the main supplies are cleaned up.

It goes without saying that fruit, to rank as first class, must be free from blemishes due to fungi and insects. It must be of fair size and color for the variety, uniform, and so carefully picked and handled that it shall be free from even slight bruises. If only such fruit is stored, the risk of keeping and of realizing a satisfactory price under changing market conditions is very much less than otherwise. Tight packages for cold storage apples, head cushions at top and bottom of barrels are desirable. Paper wrappers are of value in packing the fancy grades.

Store Quickly.

Now comes the point which, possibly more than any other, is a common source of loss here in Arkansas. The intelligent grower may as a matter of good judgment observe the points just mentioned, but blunder here because the lesson learned comes only after experience or very careful inquiry. The mistake referred to consists in barreling or boxing up apples and letting them lie in the orchard or in buildings for several days before they are sent to storage. Sometimes the car remains on the track several days before the fruit is sent to storage. In one case coming to my knowledge the fruit was kept out of storage for several weeks. Fruit so handled is almost sure to shrink to the extent of 30 or 40 per cent by January, sometimes more.

One year, as an experiment, the writer kept thirty barrels of apples in a shed at the barn during warm weather in late September. They were allowed to remain there in the shade for a week before they were hauled away and placed in storage. In the last apples shipped that season (in March) the shrinkage was not over 10 per cent for apples placed promptly in storage, while for the bulk of the stored stock, consisting of several carloads shipped out before this, the barrels were simply opened and "plugged" (the insertion of two or three apples at the top to prevent shaking about) in loading them out. Of the thirty barrels, however, held for a week during warm weather only ten barrels were left after rerunning them when shipping out the last fruit. The rest of this particular lot had rotted.

The rule to be invariably followed in handling apples for storage is to get them into storage the same day they are gathered and packed. Occasionally it may be necessary to hold till the next day or over night, but the rule should be to have them in the storage room within three or four hours after being packed. The sooner the better.

Much Depends.

The opinion has been prevalent that apples from cold storage "go down" quickly when taken out of storage. This is not necessarily true, as recorded experimental results of investigations have shown.

Much depends on the variety, ripeness, soundness or condition of the fruit stored, and the temperature to which the fruit is removed. The sudden exposure of apples from cold storage to a much warmer temperature results in copious "sweating," even to the point of dripping in a few minutes. The packing of better grades of fruit and earlier disposal of the fruit would obviate the necessity of much of the "rerunning" of stored apples and prevent much loss. Where necessary to rerun the fruit, some plan of avoiding this sudden extreme change of temperature would be of great value. This might be accomplished by rerunning the fruit in cooler temperatures, or letting it stand unopened and compact in a slightly warmer room for a day or so before opening and rerunning it.

SCIENCE IN THE ORCHARD.

The state of Kansas has not been a prominent fator in the apple market in the past, but it may become so in the course of the next few years. If it ever does, the credit will be due to the Kansas Agricultural College, which has been doing missionary work in the direction of scientific orchard culture. The college last year "borrowed" orchards in the state to give the owners practical object lessons. One of these orchards, located near Fort Scott, was twenty years old and had never been distinguished for its product. The college experts took over half of the orchard, containing 105 trees, used the spraying machine freely, and gave it scientific treatment. The result was that these 105 trees yielded 456 bushels of choice apples, besides a quantity of apples that the owner of the orchard either made into cider or sold as windfalls. The cash receipts altogether were $1,027.40. The net profit was placed at about $900. This was more than he had realized in twenty years. Naturally, he has become a convert to scientific treatment of orchards. Its value was demonstrated practically before his own eyes. One such lesson is of more value than a ton of pamphlets and learned essays. Agricultural institutions as well as farmers can learn something from this experiment.—Green's Fruit Grower.

Conifers for California

At a recent monthly meeting of the Los Angeles County Horticultural Society composed largely of nurserymen, seedsmen and gardeners, Mr. J. J. Reeves delivered an address on the conifers of Southern California which was listened to with greatest interest, and the members expressed themselves as having been much profited by it. It contains such a fund of information that we quote from it extensively. Mr. Reeves said that he could no more than touch upon the coniferae in such a short address. He divided the coniferae into six classes, as follows: Abietineae, Auracariae, Cupressineae, Taxeae, Podocarpeae, Taxodieae.

ABIETINEAE.

The best examples are Abies (Firs), Cedrus (Cedars), Larix (Larch), Picea (Spruce) and Pinus (Pines).

Abies.

Of the Abies the best are A. conocolor, A. amabilis, A. nobilis and A. grandis; these four are California natives and are all good. A. pinsapo is a species from Spain; A. Nordmanniana from the Crimea. All Abies I find have a tendency in Southern Caliofrnia to grow stronger upon the north and east sides, and to obtain the very best results they should be planted in such a position that they are in the shade of buildings or tall trees upon the south and west.

Cedrus.

The true cedars are well adapted to our climate. C. Libani is, in congenial situations, the grandest of all, but of little use in Southern California.

Cedrus deodara, the Himalayan cedar as known here, is correctly, Cedrus Atlantica glauca; this is the most ornamental and most useful cedar. It should be used entirely as specimens as its great beauty lies in its well-furnished base, and if pruned up for shade purposes becomes at once unsightly.

Cedrus Atlantica, C. Atlantica glauca and C. verticiliata are of somewhat slower growth in the young state, but finally will catch up with C. deodara. Either of these should be used extensively as avenue trees. They all three carry their limbs somewhat horizontal to the trunk and do not look "butchered" when trimmed up.

Larix.

These are not of much use here. The best for massing are the European Larch (L. decidua) and L. occidentalis.

Picea.

The only ones in this large tribe I recommend for California are P. Alcockiana, P. excelsa and P. orientalis. Of the three, P. excelsa and its very many varieties is best.

Pinus.

The Pines are particularly useful and should certainly be used more. For avenue planting P. Canariensis, P. Torreyana and P. halapensis; near the sea coast P. maritima. For massing we can add to these mughus and P. muricata in cool shady situations. P. ponderosa and P. Coulteri both are slow. P. Coulteri, however, is well worth growing as garden specimens. P. Pinea (Stone Pine), P. Canariensis and P. Coulteri are the best.

Pinus insignis I do not advocate as good for any purpose; it is a fine appearing tree but seems to have the faculty of either dying or running back just when it has attained its full beauty. The cause of this is hard to explain, for it seems to be a pine particularly exempt from pine fungi.

AURACAREAE.

The next tribe, Auracareae, contains the Auracaria, Agathis and Cunninghamia.

Auracaria.

Auracaria are too well known to need any discussion.

As specimens, A. Bidwillii, A. excelsa and the latter's many forms are the standards.

Auracaria imbricata is both ornamental and interesting but of very slow growth.

A. Cookii and A. Cunninghamii are only for massing, as they soon shed their lower branches.

Agathis.

The only one in the tribe of any account in Southern California is Agathis australis, the Kauri Pine. Unlike the true pines the needles or leaves of the Agathis are very thick and broad. This variety is well worth planting.

Cunninghamia.

This is seldom seen; it is closely allied to Auracaria, and the best is C. lanceolata.

CUPRESSINEAE.

This tribe is very large and a very hard one to select from. The most known and most used are undoubtedly the Lawson Cypress (Chamaecyparis Lawsonianum). The best examples of Lawson Cypress are varieties: viridis, erecta, pendula, and horizontalis, with their many color distinctions, as aurea glauca, argentea, etc.

Cupressus.

C. Lusitanica glauca and C. Guadalupensis glauca are without question the best tall types; C. Guadalupensis is perhaps the best form.

Cupressus Knightiana is the very best tall green variety, and although a Californian type, is seldom seen.

C. Goveniana, another California variety, is of a tall loose growth.

C. McNabiana is a good dwarf, dense form, and should be better known.

C. sempervirens, the Italian cypress, is in its true type very slender, erect, and dense. The variety most seen in California seems to be a bastard between C. sempervirens and C. funebris.

C. funebris, the sombre cypress, is, as its name implies, funerial in habit in its young state and is somewhat like the Italian, but it branches out very irregularly when old and its color is perhaps the blackest of all cypress.

C. Turnefortii is the best small close specimen cypress.

C. majestica is, as its name implies, majestic, of very tall straight growth, loose and slightly pendulous habit.

C. Arizonica, for dry situations one of the best; this cypress is a very heavy wooded, coarse, dense type in the young state strongly variegated as it attains its growth. May be said to be silvery grey. A good useful variety and one bound to become a favorite.

Juniperus.

Juniperus come next in this division, another large tribe, but few of them of any use here.

Juniperus Virginica, Juniperus communis and its variations, are good. Juniper Hibernica, the Irish Juniper, is a very pretty variegated type but of slow growth.

Juniper Bermudiana, I think, is the

MILK STRAIN
Petaluma Cal

best for this locality. It is a good grower and retains its color.

Two procumbent types, Juniperus Sabiniana and J. prostata, are excellent for ground covers.

Thujas.

This is a useful group, although most all Thujas when they become old are more or less ragged and expose the dry inside. For heavy planting the best are T. Chinensis and T. occidentalis.

Thuja aurea, T. compacta, T. pyramidalis, T. densa and T. Elwangeriana are the best for specimen use.

Thuja gigantea or, correctly, Libocedrus decurrens, is the finest, not only of all Thujas, but of all tall conifers. It is symmetrical, handsome and a fast grower; it should be used as a country roadside tree, growing well in any soil.

PODOCARPEAE.

In the next tribe are the Podocarpus; I am only slightly acquainted with them and aside from the interesting fruit some of them bear, I do not commend them.

TAXEAE.

Another division. The best examples are Taxus, the Yew and Torreya.

Taxus.

Of the Yews, T. baccata, the common Yew, is the best for general use.

T. baccata fastigata, the Irish Yew, does well here and is taller and more compact than the common T. baccata. T. brevifolia is a native species somewhat like the Irish, only of a lower habit. T. cuspidata, a dwarf Japan Yew should be grown more.

All Yews to do well should be planted on a damp heavy soil.

Torreya Californica.

The California Nutmeg or Stinking Yew, is the only Torreya worth growing, and if afforded a moist situation will make a very ornamental tall shrub.

A Japan species, Torreya taxifolia, I believe would be of use here under good conditions. The only plant I ever saw here was planted on a light soil and was anything but handsome or vigorous.

TAXODIEAE.

In the sixth and last division we have Cephalotaxus, Cryptomeria and Sequoia.

Cephalotaxus or Cluster Yew.

Of these there are but three worth growing; all of them are slow.

C. drupacea and C. pedunculata, both Japanese varieties, are the best. C. Fortunei, a Chinese species, is more compact but also dwarfer than the Japanese.

Cephalotaxus are perhaps more handsome than Podarcarpus, the fruit being carried on long drupaceous branches and are when grown well somewhat showy shrubs.

Cryptomeria.

Cryptomeria elegans is without doubt the most ornamental and useful, and to get its full beauty should always be used as a specimen.

Cryptomeria Japonica is also very handsome in its small state, but will in a few years shed its lower branches. However, I think it well worth planting as a tall unit in masses.

C. Japonica var. Lobbii is seldom seen but quite handsome; it is really a dwarf form of Japonica and is fairly dense.

Sequoia.

Sequoia gigantea. This handsome tree should be used more, and if planted on loose or well drained soil will retain its lower branches and not become sparse or thin.

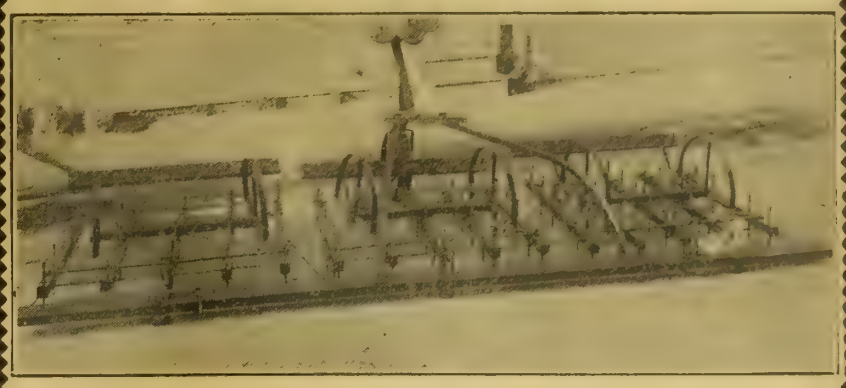
S. Sempervirens, the Redwood, is well suited to Southern California, and being a deep rooted tree, I con-

(Continued on Page 629.)

THIS MODERN HARROW

—WILL SAVE YOU—

TIME and MONEY



Three section (90 teeth) six-horse harrow

—PATENTED—

Points of Superiority

It is automatic. It is self cleaning. Can be ridden. Saves strength and labor. Can be operated by a twelve-year-old boy. To clean press the foot pedal. Frame made of seasoned oak.

PRICES

One section, without cleaning attachment or cart	$10.00
Two sections, without cleaning attachment or cart	19.00
Three sections, without cleaning attachment or cart	27.00
Four sections, without cleaning attachment or cart	36.00
Cleaning attachment, per section	6.50
Riding cart for one, two, three or four sections	10.50
Frame, without teeth, per section	8.50
Draw bar for two sections, $2.00; three or four sections	2.50
Rear action, per section	1.50

You can purchase the self cleaning attachment and put it on your old harrow. Riding cart may be purchased separately.

Would you like to know more about this new harrow, which will lighten farm work and at the same time do it more effectively? We guarantee this harrow to be the most satisfactory and economical on the market. You can do more work and better work with it than with any harrow you ever used.

Send in your order at once or write for further information.

LILLY'S SEEDS

These 3 Vegetables for 10 Cents

This is not a bargain, but an introductory offer to get you interested in Lilly's Seeds, and to prove to you their quality and reliability.

LILLY'S "DELICIOUS" LETTUCE. A variety introduced by us, very early with fine, hard, medium-sized heads, rich yellow heart, with a delicious buttery flavor.

LILLY'S "EARLIEST OF ALL" RADISH. A very small, round, bright red radish with white, crisp flesh of a delicious, mild flavor. An excellent variety for cold frame.

LILLY'S "NEW WHITE QUEEN" ONION. A very early, small, round variety of fine, crisp flesh, with a deliciously mild flavor. A great favorite for the home garden, easily grown and matured.

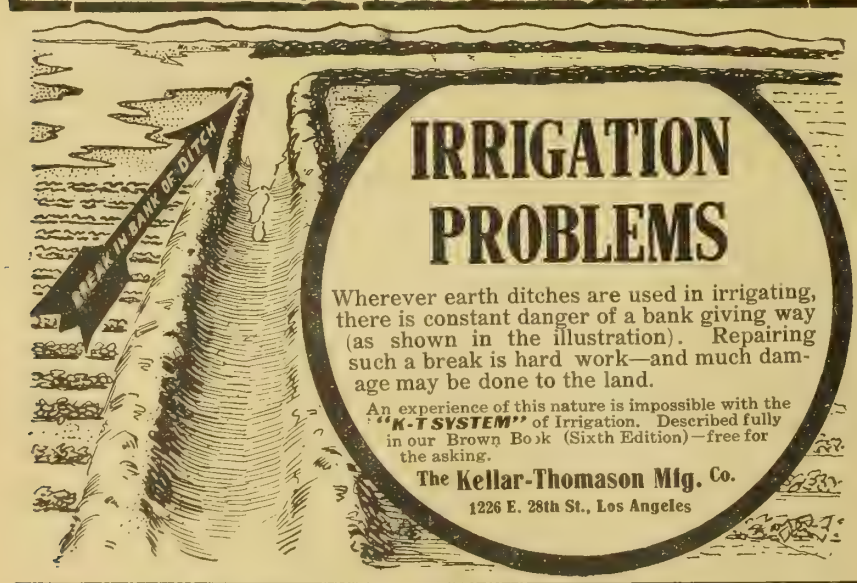
The above three varieties are all regular 10 cent packages. We offer the three for 10 cents to introduce. Send money order or stamps.

Catalogue Ready for Mailing, Free

Send for a copy of Lilly's Annual Seed Book, 126 pages, fully illustrated with cultural directions.

Lilly's Seeds are the Standard of the West. They have given satisfaction to farmers for over a decade. They are particularly adapted to the climatic and soil conditions of the West Our seeds are tested by us before being offered for sale. We have an expert seed tester, a government graduate.

Chas H. Lilly Company, Seattle, Washington



IRRIGATION PROBLEMS

Wherever earth ditches are used in irrigating, there is constant danger of a bank giving way (as shown in the illustration). Repairing such a break is hard work—and much damage may be done to the land.

An experience of this nature is impossible with the *"K-T SYSTEM"* of Irrigation. Described fully in our Brown Book (Sixth Edition)—free for the asking.

Small Fruits and Vegetables

THE TRULY CELEBRATED VIRGINIA PEANUT.

The original home of the peanut is not definitely known. Africa, Europe and South America each claim it. Brazil comes the nearest to establishing its claim. Certainly the United States leads all countries in its development, and the variety of uses to which it is put. It was introduced into the United States early in colonial times, but did not become of any commercial importance, or attract the attention of the business world, until between 1870 and 1875. For 25 years thereafter the growth of the peanut industry was very gradual. In fact, the development of the product has been practically about all accomplished since 1900. Since that time it seems to have doubled nearly every year. The normal crop in Virginia is about 12,000,000 bushels yearly. The value to the farmer is not far from 75 cents a bushel, ranging between 60 cents as the minimum to $1 as the maximum.

The peanut is a peculiar crop. It is a legume which develops its pods underground. In different sections it is known as goober, goober pea, pindar, ground pea, ground nut and peanut. New varieties are being introduced, each having its special features to recommend it.

The principal types of peanuts grown in Virginia are the bunch, runners and Spanish. The bunch nuts grow close around the roots, the runners grow farther away from the stems. The Spanish nut is small, generally only two peas to the pod. It weighs heavier than the other varieties and is much richer in oil.

The soil required is a sandy, friable one that will not bake or get hard on top after rain. It must be thoroughly prepared and finely pulverized. Lime is an essential element in the crop. The average width of the rows is 36 inches, and the plants are 12 inches apart in the rows. The nuts used for seed must be shelled by hand, so as not to disturb the skin covering the kernel and holding the two halves closely together. A half bushel of shelled nuts will plant an acre.

A one-horse planter drops and covers the seeds at regular intervals, and presses the soil down closely. Except for the shelling of the seed peanuts the crop is not much more trouble to plant than corn, and the cultivation is about the same. The most interesting feature about the nut is its manner of forming the pods. The bloom of the peanut comes out on the underside of the vine, at the joints, and soon dies. A little stem, or "peg," as it is termed, is formed, and hangs downward. As it lengthens, it penetrates the soil. On it under the surface hang the peanuts. "Pegging" time is the critical period in the life of the plant. If the soil be hard, the peg cannot enter, and the peg dies—no peg, no peanut. The yield varies, like all other crops, depending upon the man and management, say from 30 to 75 bushels to the acre.

At digging time, the general way is to take off the moldboard and run the plow close to the row on each side. This cuts the roots and leaves the plants standing upright, just as they grew. The hands come after the plow, lifting the plants from the loosened earth, gently shaking off the dirt, and leaving the peas to dry out partially in the sun.

The most exacting part of the work is stacking or shocking, so as to cure properly. A pole about 8 feet long, sharpened at the lower end, with two crosspieces nailed to it about 18 inches from the point, is firmly driven into the soil, leaving the crosspieces about 6 inches from the ground. Around these poles the peas are placed, about as beans are stacked in bean-growing sections. The crosspieces keep the lower strata off the ground. In stacking the nuts are turned inward toward the middle, leaving the foliage exposed. This keeps the nuts from getting weather-beaten.

In this shape the nuts remain, say, six weeks, and then are either picked off by hand or threshed off by machinery. A machine is now perfected that takes the nuts from the vines rapidly and without injury. By the farmer the nuts are placed in large sacks holding four bushels each, 22 pounds to the bushel. In this shape they are stored until sold. At this point the peanut ceases its history as an agricultural product, and goes into the hands of cleaners, assorters and manipulators and becomes an industrial product. In this latter half of its history, before it reaches the consumers, it may pass through 50 different operations before it emerges as one of the many peanut products, candy, oil, butter, salted pea, nuts, or as regular peanuts, for the peanut stands of the country.—Orange Judd Farmer.

SHIPPING TOMATOES AND MELONS FROM VALENCIA, SPAIN.

By Consul Robt. Frazer.

Tomatoes for export are packed in boxes of two to three dozens arranged in two layers, and 16 of these small boxes are inclosed in a skeleton crate of two compartments. The total cost of boxes, crate and packing, including cartage and shipping expenses, is about 72 cents. This trade, however, shows no expansion in recent years, but rather appears to be declining since the canning of tomatoes has been brought to such perfection. Moreover, tomatoes from the Canary Islands, France, and the Channel Islands are now largely supplying demand for fresh tomatoes in Great Britain, which was formerly dependent to a great extent on the products of this district.

Melons are packed in boxes of two compartments containing two to three dozen each and about the size of an orange case. They are wrapped in rice straw and the total cost of boxes, packing material, labor, and shipping is approximately 30 cents per box. Melons are usually purchased by the dozen of standard size, which is determined by an iron ring. All fruit just passing through the ring is counted three dozen for two of standard dimensions, and if very small, two dozen are allowed for one. As this custom is nearly always in favor of the purchaser, growers have been agitating for some years to have melons sold by weight only, but so far have not succeeded against the combined opposition of packers.

The finer and more delicately flavored melons are rarely exported, owing to their liability to deterioration in the poorly ventilated holds of ordinary cargo ships, as no cold storage methods have been provided yet for the transportation of Valencia fruits and vegetables either by sea or land. The variety of melon most exported is of oval shape and canary color and is rather insipid, but resists the sea voyage well.

The Ornamental Garden

A SENSE OF BEAUTY.

There were two brothers; one was a prosperous manufacturer, the other a farmer. Both were more than ordinary men, in that they conducted their business with brains and energy. The manufacturer came to visit the farmer and so as they walked over the fragrant fields, they had a heart to heart brotherly talk. The farmer was somewhat discontented. He felt that somehow he was not making the amount of money that he should and he appealed to the well-trained, constructive understanding of his brother for a reason.

"Well, Jim," said the manufacturer, "I can see one reason. You are too much like the great mass of farmers. You have too little sense of the beauty of your surroundings. You think that all time, labor and money laid out in that direction isn't practical, that it is just so much time, labor and money wasted. I have learned in my business that a sense of beauty is built upon a sense of order and harmony, and let me tell you, Jim, a farm is a good deal like a factory; there must be a close relation of order and harmony between the several parts. It would pay you to get some good landscape artist to come here and make a study of this farm and the general arrangement of the fields and buildings with an idea, first, of the greater economy of time and labor in their relation to each other; second, with a view to making the whole thing look better, handsomer. Put things in good workmanlike shape to start with; then make them look neat and attractive.

"You think there is no money in those things. I tell you that a sense of order and beauty is one of the fundamental things in a farm or factory in making either pay to the best degree. Where order and beauty exist there is the least waste of time and labor. System prevails.

"Most of the farms I see as I spin out in the country with my automobile, strike me with the idea that the man who lives there has no sense of order or beauty. I notice it in the buildings, in the horses, in the cattle, in the general slip-shod look of things all about. Do you know that a man with that sort of idea of the relation of things can't make money.

Then as they strolled back to the house they fell to calling up the farmers whom they knew in boyhood who were the most prosperous. In every instance their farms and premises showed a well-kept, orderly and attractive appearance. "I tell you, Jim, there's something in it," said the city brother and Jim acknowledged that it looked that way.

Now this simply means that with either farm or factory, as the owner is, so is the farm or factory; the relation of the man to his business. Is he big enough for it? It takes a man of good big brain and that brain well stored with right ideas to make a farm respond to the best degree. We are just awakening to the understanding that the farm boy needs some special education and mental training to make him "big enough for his business," and a sense of order and beauty is a very important part of the business.—Hoard's Dairyman.

Yuba County's orange and olive crop is the greatest ever.

CARE OF TRUNKS OF PALMS.

Miss K. O. Sessions.

Very few are willing to let the palm grow as it will gathering its old and faded leaves about its own trunk and although dry, and apparently useless they "hang on' 'forever(?)

In very many cases I think the old leaves add a great deal to the dignity of the palm, but if trimmed off the base of the palm leaf should not be cut too close to the trunk. At Honolulu the air is so filled with the minute spores of ferns that it settles like dust everywhere and the result is that the rough trunks of all the palms are veritable ferneries. All sorts and kinds are growing in the axils of the old palm leaf and soil gathers to some extent, helping to make the best of materials for the growth of the young ferns. Here we can with very little care ornament the trunks of the large date palm with several varieties of ferns, kenilworth ivy, sedums in variety, lycopodium, asparagus, sprengerii, the strawberry geranium and many a dainty growing plant that has few roots and loves shade and moisture. As the date palm becomes twenty years old about the base an accumulation of surface roots are not pleasing and this can be improved with a circular bed of begonias or ferns or both together—built up from six inches to eighteen inches above the ground as conditions require. Rough rock or even cobbles serve to hold up the bed and look well with the plants. Several varieties of orchids would grow in just such a location if the watering could be properly managed.—California Garden.

EDGING PLANTS.

A subscriber from Allegheny County, Pennsylvania, wants to know if there is anything better for an edging than portulaca. She has found it very satisfactory, but it blooms only during the early part of the day. In Europe, the most popular plant for a flower edging is blue lobelia. This blooms continuously throughout the summer and autumn. It is a little more difficult to start than portulaca, and it does not bear the hot sun so well. For a white border plant, sweet alyssum is excellent for general purposes. The dwarf compact petunia is also very desirable for an edging, being showy, free blooming, and continuing in bloom for a long time. For a permanent edging of foliage, the hardy plant known as aegopodium podagraria is among the best. It is as attractive as the silver leaved geranium, and when once planted will remain for years. An annual that is also much used in Europe is the dwarf single French marigold. A good strain of this annual is very effective; the flowers, however, are mostly brown and yellow, colors that are not always appreciated. A good edging much used in Europe, too, is dwarf ageratum. It is readily grown from seeds, is everblooming, and likes the hot sun.—Park's Floral.

Population must increase rapidly, more rapidly than in former times, and ere long the most valuable of all arts will be the art of deriving a comfortable subsistence from the smallest area of soil. No community whose every member possesses this art can ever be the victim of oppression in any of its forms. Such a community will be alike independent of crowned kings, money kings and land kings.—Lincoln.

Irrigation and Forestry

PROTECTING DOMESTIC WATER.

Secretary Wilson has decided that the interests of cities and towns which obtain their water from streams having their watersheds within national forests call for special measures of protection, and he has therefore developed a plan of co-operation for the Department of Agriculture with those communities which are alive to the importance of keeping their water supply pure.

There are many western towns and cities, some of them of large size, which derive their water from drainage basins lying inside the national forests. One of the recognized objects of forestry is to insure the permanence and protect the purity of municipal water supplies. As the forests are maintained for the benefit of the public, Secretary Wilson considers it the duty of his department to do all that it can both to prevent the pollution of such supplies and to create or maintain conditions most favorable to a constant flow of clear water.

Stock raising and occupancy of the land for the various kinds of use which are ordinarily encouraged on the national forests may be highly undesirable if allowed on drainage basins which are the sources of drinking water. There is also to be considered the injury which may be done if the water is silt-laden. By protecting and improving the forest cover and by enforcing special regulations to minimize erosion and to provide for the maintenance of sanitary conditions, the government will try to safeguard the interests of the public.

A form of agreement has been drawn up, providing that when co-operation is entered into between the secretary of agriculture and any city desiring conservation and protection of its water supply, the secretary will not permit the use of the land involved without approval by the town or city except for the protection and care of the forests, marking, cutting and disposing of timber which the forest officers find may be removed without injury to the water supply of the city, or for the building of roads, trails, telephone lines, etc., not inconsistent with the objects of the agreement, or for rights of way acquired under acts of Congress. The secretary also agrees to require all persons employed on or occupying any of the land both to comply with the regulations governing national forests and to observe all sanitary regulations which the city may propose and the secretary approve.

The agreement provides for the extension and improvement of the forests on the part of the government by seeding and planting and the best methods of silviculture and forest management, so far as the funds available will permit. The city on its side is expected to assist in the work by paying the salaries of the additional guards necessary to carry out the agreement, and in case extensive forest operations are immediately desired by the city, it would bear the major part of the cost entailed by this work.

WATER POWER WITHDRAWALS.

Over a million and a half acres of public land now stand withdrawn by the government as being valuable for the possible development of water power. During October the United States Geological Survey recommended the withdrawal of 54,422 acres as having power possibilities and the restoral of 2600 acres in Montana and Wyoming because field examination by the Survey showed them not to be valuable for that purpose.

NEW TOPOGRAPHIC MAPS.

Fourteen new topographic maps were printed from engraved plates by the United States Geological Survey during October, the average edition being about 3500 each. These maps are widely distributed over the United States and those of California are:

Gilsizer Slough, Grimes quadrangle, Mills quadrangle, Ostrom quadrangle, Sutter quadrangle, Yuba City quadrangle, Sacramento Valley ,price 15c.

The editions of these and reprints of other topographic maps made a total output for the month of 102,266 copies. The maps are sold by the Survey at the nominal cost of 5 cents a single copy or $3 a hundred (except certain special or extra large sheets). The Survey has published over 2000 maps, covering nearly 40 per cent of the area of the United States. For the convenience of purchasers index maps showing the areas covered by Geological Survey maps of the several states will be furnished on application to the Director of the Survey at Washington.

WEATHER EFFECT OF FORESTS

By direction of Secretary Wilson the weather bureau and the forest service are making an exhaustive study of the entire question of forest effects upon climate and stream flow. The experiment station at Wagon Wheel Gap, Colo., established for the purpose of this investigation, is now on a firm basis, and a complete series of observations has been made during the last eight months. Co-operative meteorological stations are also maintained in the Conconio National Forest in Arizona, and in the Fremont National Forest in Colorado, data from which will be available for study and comparison in connection with the records at Wagon Wheel Gap. However, it should be understood that results obtained in this semi-arid region would be without value as a criterion for determining problems in connection with runoff that obtain in the humid regions of the East. It is hoped that in course of time an experimental area may be secured and the necessary plant installed in both the Allegheny and White Mountain regions.

AMOUNT OF WATER WHICH MAY BE STORED IN SOILS.

Actual experiments show that the actual field water capacity of arid soils varies from 14 per cent for a very sandy loam to 18 per cent for a clay loam, with an average of about 16 per cent. The greatest water capacity would be even more. At this rate every 12 inches in depth of soil can hold from 2.25 to 2.65 inches of water, or an average of 2.45 inches. At this rate it is possible to store approximately 20 inches of water in the upper 10 feet of soil. This is from one and one-half to two times the annual rainfall over the better dry farming sections. Therefore, it should be and is possible to store one or two year's rainfall in the soil, by using proper tillage methods.—D. W. Frear, Instructor in Agronomy, Colorado Agricultural College.

WHAT RIVERS CARRY.

Colorado River discharges during an average year into the Gulf of California 338,000,000 tons of mud and silt as suspended matter. In addition to this the dissolved substances in the water include 4,550,000 tons of sodium chloride, or common salt; $3,740,000 tons of Glauber's salts; 4,000,000 tons of lime; 2,400,000 tons of gypsum; and 4,800,000 tons of Epsom salts. In spite of all this dissolved material the Colorado at its mouth is not considered to be a stream of unusually high mineralization for that region of the country. The reason is that the river also carries so enormous an amount of water that the dissolved salts constitute a comparatively small proportion of the total discharge. Other streams in the country contain dissolved salts in greater concentration—for example, the Elm Fork of Red River, in Oklahoma, discharges nearly 1,300,000 tons of common salt annually. Although this amount is not so great as that discharged by the Colorado it is much greater in proportion to the size of the area drained. The discharge of salt from the Colorado is equal to 20 tons annually to each square mile drained by the river, but the salt in Elm Fork of Red River is equal to 1680 tons per square mile of area drained. The same river discharges annually 177,000 tons of magnesium chloride, 168,000 tons of Epsom salts, 690,000 tons of gypsum, and 54,000 tons of lime. These quantities, too, are considerably greater than those carried in the Colorado in proportion to the size of the drainage area.

Determines Practical Value of Waters.

The foregoing are a few of the figures of incidental interest presented by Water Supply Paper 274 of the United States Geological Survey, entitled "Some stream waters of the western United States." The work reported by this volume is, however, of higher practical importance than the above statement would indicate. It is the result of an investigation of the quality of western stream waters made for the purpose of determining their availability for use for irrigation and other purposes. For a water supply system the quality of the water available determines its usefulness quite as much as the quantity. Some waters contain ingredients that make it impossible to use them for irrigation unless certain precautions are taken in applying them to the land and in draining them off. Certain ingredients in water make it unavailable or destructive if used in boilers and the quality of water used in a manufacturing plant may very largely determine the quality of the product of manufacture. The report just published therefore can not fail to be of material value to the manufacturing and agricultural interests of the West; and the proper consideration of the information that it contains will prevent many costly mistakes in connection with the industrial development of that part of the country.

He who digs a well, constructs a stone fountain, plants an orchard, builds a durable house, reclaims a swamp, or so much as puts a stone seat by the wayside, makes the land so far lovely and desirable, makes a future which he cannot carry away with him, but which is useful to his country long afterwards. The man who works at home helps society at large with somewhat more of certainty than he who devotes himself to charities.—Emerson.

He is no clown that drives the plow, but he that does clownish things.—Poor Richard.

NATIONAL QUARANTINE.

(Continued from Page 611.)

antining foreign districts or particular plant products in foreign districts to exclude disease or insect enemies which can not otherwise be kept out of this country.

This is the provision which has been most objected to by importing nurserymen, and especially by importers who have invested in foreign nursery enterprises in France. It is not the intention to apply this section except in the case of diseases or other dangers which can not be kept out by inspection or disinfection; in other words, at present it would apply only, so far as we know, to the potato wart disease and the white-pine blister rust. The fears are absolutely groundless that the department of agriculture, in enforcing this section, would unnecessarily interfere in any way with legitimate importations of plants, and in those cases where importations carry grave dangers the importers themselves, if honest in their intentions, should be the first to assist in keeping out these dangers.

This same provision in the law relating to the importation of domestic animals has been the means of safeguarding the livestock industry of this country, at a saving beyond computation, and there has been no abuse or complaint of abuse of the power thus delegated.

Section 7 provides for quarantining districts within the United States where new diseases or insect enemies have gained a foothold until such districts have been freed from disease or insects.

Referring to the animal law again, a similar provision has been of untold value in the United States in stamping out, for example, the foot-and-mouth disease and in limiting the spread of the southern cattle fever. In the case of insects, it would enable the government to stamp out any sporadic infestation of the brown-tail moth or gipsy moth, or the potato wart disease, the white-pine blister rust, or the chestnut blight. This section hitherto has not been especially objected to by nurserymen, and is certainly a very essential provision of any measure aimed at the protection of all plant interests.

Section 8 defines nursery stock.

Section 9 provides penalties for violations of any of the provisions of the act.

Sections 10 and 11 relate to the appropriation and date when the act shall become effective.

This bill, when it comes before the first regular session of the present Congress, will be subject to amendment and a full discussion, and all reasonable criticisms on the part of nurserymen will be considered and if, to meet their criticisms the bill can be amended in any way without losing the protection aimed at it will be so amended.

Pomona Patent Pressure GATE

100% proof against repairs and trouble compared to other gates—that is what the experience of users proves.

We do not mean to say that our gate is proof against repairs or trouble, but because of the following features it will give you **more service** than your money can buy anywhere else.

Just note this carefully:

The POMONA Patent PRESSURE GATE has **no** rubber or wooden facing to give out just at the wrong time.

When closed, this Gate is ABSOLUTELY water tight.

The locking mechanism is protected against rust and it will not clog with sand or dirt.

It is constructed RIGHT and is made to give years of service.

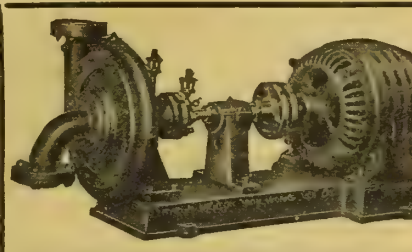
The POMONA Patent PRESSURE GATE is not a high-priced gate.

The locking device is the simplest made. The cover can be locked in any position and locks in an absolutely water tight joint.

We furnish a two-foot handle with every gate. Send for detailed information. We also make circular valves for orchard and alfalfa irrigation.

Pomona Man'fg Co.

POMONA, CALIFORNIA



Byron Jackson Pumps

are so carefully designed and constructed that they have a higher efficiency than any other pump of this type. Lowest in price.

Write for Descriptive Catalog.

Patented Automatic Water Balance Irrigation Pump, direct connected to electrical motor, self-operating.

Byron Jackson Iron Works Inc.

357-361 Market, St., San Francisco

WORKS: Carlton Station, West Berkeley, Cal.

Save Money By Buying This Good Second-Hand Pipe

We can supply you with any size and quantity of Standard Pipe or Casing—all new threads and couplings—all stock guaranteed first-class.

If thinking of buying any kind of pipe, your best interests will be served by writing us for prices and particulars.

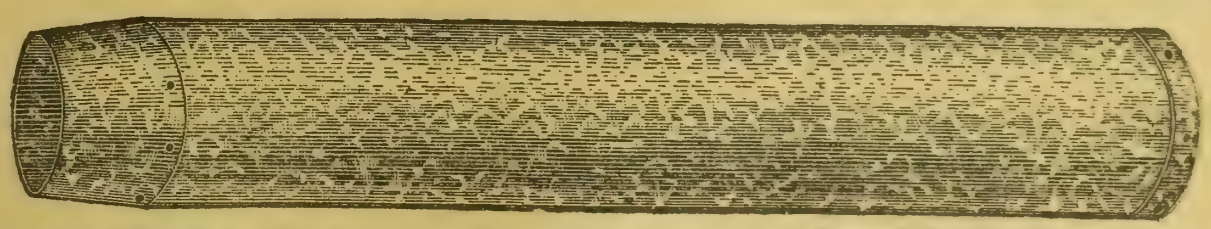
PACIFIC PIPE CO., Main and Howard Streets, SAN FRANCISCO.

ARNOTT HARNESS $10.00 to $80.00

Everything guaranteed. Money back if not satisfactory. Factory in Los Angeles. California leather for all uses. Send for No. 10, eighty page FREE Catalogue.

ARNOTT & COMPANY 112–118 So. Los Angeles St. Los Angeles, Calif.

SAVE YOUR TIME WATER and GRADING BY IRRIGATING WITH AMERICAN SURFACE IRRIGATION PIPE



The PIPE RECOMMENDED BY ALL USERS. It is the ONLY SCIENTIFICALLY CONSTRUCTED SURFACE IRRIGATION PIPE on the market. THERE'S NO ROUND SEAMS TO LEAK, retard the flow of water or weaken the pipe. This pipe is easily handled and cheaper than flumes. It will last a life-time. For irrigating alfalfa it is the only pipe to use. We make RIVETED PIPE AND TANKS. Write for Illustrated Catalogue, also SPECIAL IRRIGATION FOLDER which may mean much to you.

CONTENTS THIS WEEK

POULTRY SHOW IN THE WHITE LEGHORN CITY, Cover.

PETALUMA POULTRY SHOW, 609.

CITRUS AND TROPICAL FRUITS.—National Quarantine Law; Quarantine of Nursery Stock; 610, 611.

DECIDUOUS FRUIT CULTURE.—Suggestions on Storage of Apples; Science in the Orchard; 612, 613.

CONIFERS FOR CALIFORNIA; 614, 615.

SMALL FRUITS AND VEGETABLES.—Virginia Peanuts; Shipping Tomatoes; 616.

ORNAMENTAL GARDEN.—Sense of Beauty; Care of Trunks of Palms; Edging Plants; 617.

IRRIGATION AND FORESTRY.—Protecting Domestic Water; Typographical Maps; Weather Effect of Forests; What Rivers Carry; Amount of Water in Soils; 618, 619.

EDITORIAL.—Counties Committee; Bee Keepers; Citrus Fair; Irrigation Congress; Poultry Shows; $8,417,000,000; Study Finance; Farmers of 40 Centuries; Sugar Beet Prices; 620.

AGRICULTURAL NEWS NOTES OF THE PACIFIC COAST.—Northern, Central, Southern, The Coast; 621.

LIVE STOCK AND DAIRY.—Co-operative Creamery; Ice Cream; Dairy Herd Inspection; 622, 623.

PROFIT IN THE POULTRY YARD.—Escondido's Maiden Effort; Corning Poultry Show; Oroville's Money Makers; Marketing Poultry; Stimulating Laying; Los Angeles Poultry Show; Green Bone; Value of Duck Eggs; Prospects of Poultry Industry in California; Why Hens Cackle; 624, 625, 626, 627.

BEES AND THEIR CARE.—How I Find Things in San Diego County; 629.

QUESTIONS AND ANSWERS.—Trespassing Poultry; Horse for the Farm; Co-operative Creamery; Leaf Cutter; Stick Tight Fleas; Stock Beets; Seed Production; Alfalfa Between; Alfalfa Tea; Catching Gophers; Better Kill Him; Moles; 630, 631, 632.

VETERINARY.—Cowpox; Summer Sores; Leucorrhea; Unthrifty Cow; 632.

HOUSEHOLD.—The Music of the Trees; Along the Perilous Way; Hot Breads for Cold Mornings; Good Things to Remember; 633, 634, 635.

PRODUCE MARKET.—Los Angeles Market; San Francisco Market; Citrus Markets; 636, 637.

COUNTIES COMMITTEE.

The sixteenth semi-annual meeting of the Counties Committee of the California Development Board will be held in Los Angeles January 12, 13. The general theme of the meeting will be getting ready for the crowds who will visit the Coast during the international exposition and the opening of the Panama Canal. One feature of the two-days discussion will be the handling of emigration. San Francisco boosters will make the trip to Los Angeles in special train.

BEE KEEPERS.

We give on another page program of the Northern California Bee Keepers Association which will meet in Sacramento December 27, 28. We note one of the features is the arranging and framing of a bill for appointment of state inspector. This was taken up by the State Bee Keepers Association — composed largely of Southern Californians—at the meeting held a year ago. The bill introduced failed to become a law because of disagreement within the bee keepers' ranks. The bee keepers of the state ought to get together in this matter, and whether it be accomplished through the State Bee Keepers Association or not, it can only be done by united effort. When one section works against another, legislators find the easiest way out of the difficulty is to refuse to have anything to do with the proposition at issue. Let our bee keepers unite.

CITRUS FAIR.

Governor Johnson and enough of California's assemblymen and senators to make a quorum attended the Citrus and Olive Exposition at Oroville last week. At the opening night's exercises Governor Johnson congratulated the people of Oroville upon the "blending of the romance of old California with the progress of new California." The spirit of Butte County," declared the Governor, "is making California famous the world over." The spirit which has inspired diverse and extended productions about Oroville and other Butte County sections also led to the gathering together of these products in a great exposition. This exposition was visited by residents of almost every county in the state and all were impressed with the extent of the citrus and olive industries.

IRRIGATION CONGRESS.

California failed to win acceptance of its invitation to the irrigation congress to hold its next meeting in this state. Salt Lake City proved more attractive. The officers elected at Chicago for the next year are: President, United States Senator Francis G. Newlands, Nevada; secretary, Arthur Hooker, Chicago; foreign secretary, E. McQueen Gray, Albuquerque, N. M.; first vice president, R. Isinger, Spokane, Wash.; second vice president, J. B. Case, Abilene, Kans.; third vice president, John Fairweather, Fresno, Cal.

The sessions proved of sufficient interest to hold the usual throng attending the deliberations of the congress. One of the principal discussions was regarding the financing of irrigation enterprises which have more worth on paper than in fact, and a resolution was adopted urging the states to appoint commisisons to investigate the prospectuses and claims in the literature of all irrigation and mining projects undertaken. There were many noted speakers present.

POULTRY SHOWS

The Cultivator gives considerable space this week to accounts of poultry shows from San Diego to Tehama County. The biggest of all was held at Petaluma, the White Leghorn city, perhaps the greatest poultry settlement in the world. Petaluma has not been especially strong in pure-bred poultry. While the White Leghorn has been by long odds the favorite, yet but few of the ranches there made any effort at keeping pure breds. More recently, however, the worth of blood is being appreciated and good blood is winning out. Of all the big poultry shows of the past this year's was the greatest. The engraving on the cover gives something of an idea of the appearance of the show.

Oroville made an effort in the poultry show line, making a fine exhibit the same week as its more noted Citrus and Olive Exposition. The shows at Escondido and Corning were not so large but both were aids in convincing the producer of the worth of blooded stock.

$8,417,000,000.

For the first time in many years the total value of farm products shows a decrease from the preceding year. The figures given at the head of this article represent in round numbers the estimated farm product valuation for 1911. This is $277,000,000 short of the total for 1910. The loss is chargeable to the general class of animal products and animals sold and slaughtered. Dairy cows are the only animals which have increased in total valuation. Even eggs, wool, butter and poultry have decreased. The loss to animal industry alone is about $321,000,000 over the preceding year.

Corn is by far the leading crop as a wealth producer; the estimate for the year is 2,776,000,000 bushels. That total has been exceeded by only two years. The farm price for corn is now greater than at any time since the reports of the department have been kept. Its valuation is more than twice that of cotton and but little less than the combined values of cotton, wheat and oats. Three-fourths of the world's corn crop is grown within the boundaries of the United States.

STUDY FINANCE.

Mr. David Lubin, representative of the United States at the International Institute of Agriculture at Rome, is investigating as to farmers co-operative banks which are proving remarkably successful in Germany. These are known as the Raiffessen banks, and during 1909 did a business amounting to about 6,500,000,000 marks, or something over $1,600,000,000. This immense volume of business was done without mortgages and at an interest rate to the farmers of about five per cent. It was all done by the farmers themselves and should be a hint to American farmers that they may profitably study finance as well as the science of farming. In a letter Mr. Lubin suggests that it is an opportune time for the Republican party to incorporate in its platform a scheme offering a similar system in the United States. Sure it is the two larger political parties are both in need of the farmer's vote. There seems to be general uneasiness as to results of the next election. If our farmer friends take the initiative in some needed changes in the financial system of the country, it is very probable great benefit will accrue. The trouble is too few of us who have to do with soil culture are competent to discuss intelligently great questions of finance.

FARMERS OF 40 CENTURIES.

Those who attended the soil convention held in Los Angeles some months ago, will recall that in the talks of Dr. F. H. King, he referred often to the rigid economy practiced in soil conservation in China, Korea and Japan. He made striking comparison between the methods of saving every particle which would add to the soil's fertility with the American's wasteful methods.

At that time the Doctor was writing a book descriptive of methods in use in the Orient. As is known to most of our readers, Dr. King's work was ended a few months ago by death, but it seems that this particular work was so near completion that the book has been produced and is now offered by Mrs. King. Her address is Madison, Wisconsin.

As Dr. King says: "The Chinese farmers have reached the 'root of the matter' in a thousand ways during their centuries of experience where, because of the great density of population a failure in crops invariably spelled famine and death. They were compelled to get there and stay there and they did. The American farmer is beginning to realize that the soil is a thing that must be handled with care if it is to produce a living for his grandchildren."

We have not yet seen a copy of the book, but doubt not its seventeen chapters and 248 illustrations largely from photographs by the author, will have most intense interest.

SUGAR BEET PRICES.

Following the effort of California sugar beet growers to secure a small advance in the price of sugar beets, and which was only partially successful, comes word from Washington that the House special committee investigating the so-called sugar trust, heard testimony designed to show that a reasonable profit from the sugar beet crop cannot be had today unless there is an increase in price per ton delivered to the sugar mill. The farmers attending the sessions of the committee give information that contracts between beet farmers and sugar refineries were drawn to compel the farmer to violate them as soon as the beet crop was planted. For example, one stipulation in some states is "The farmer must protect his beets from sunlight and frost." Another charge also made was that in some states the sugar trust has such power over the experiment stations that a fair test for the sake of checking up reports of the sugar company cannot be had. Representative Fordney said, "The company has such influence with the Colorado Agricultural Department that farmers can not get a private test." This is a serious charge against the Colorado Station which, we understand, is one of the most energetic in the United States, but if its energy is influenced by the sugar trusts, it is time for revision.

As was hinted once before in the columns of the Cultivator, co-operative sugar manufacturing is not beyond the realm of the possible. The government should not take up the manufacture of sugar, but it may well take a hand to secure justice to the producer, and if it cannot do that without encouraging an extensive co-operative movement, let that encouragement be given. We may mention, by the way, that one sugar company, the Holly Company at Huntington Beach, has broken away from the established five-dollar figure, and is now offering $5.25, or within 25 cents of the demand of the growers, made earlier in the season.

Agricultural News Notes of the Pacific Coast

Northern California

Phylloxera has appeared in the vineyards of Yolo County.

Willows hopes to have a cannery in operation before next fruit season.

Ukiah, Mendocino County, shipped twenty tons of turkeys on one day recently.

The Butte County Citrus and Olive Fair held last week was a complete success.

The Healdsburg, Sonoma County, Grange is making an appeal for new members.

The anti-malarial campaign at Oroville has ended for the season and has been a great success.

Five thousand cords of tan bark have been shipped from Humboldt Bay during the past summer.

The State Dairy Bureau is being charged with mismanagement by a former inspector who was discharged.

Fruit buds are exceptionally well developed which is assuring that next year's deciduous crop will be success-

The bean and corn crop output of Yuba County is making a record. The bean crop is running 30 sacks per acre. ful.

A conference of Forestry officials and lumbermen has been arranged and will be held in San Francisco in January.

The American Olive Co. which now has a large plant in Los Angeles, is looking for a site in Oroville, Butte County.

The greater part of Butte County's orange crop has been shipped. The growers received approximately $2.25 per box.

Dairymen of Oroville are somewhat stirred up over the strict requirements of the state dairy inspector who has been visiting them.

The Santa Rosa Chamber of Commerce is preparing for a fine exhibit of fruit to be shown at the State Fruit Growers Convention.

The largest hop transaction in Sonoma County is said to be that by which Mr. Peterson of Santa Rosa was paid $90,000 for this season's output.

A sub-tropical garden is to be established near the city of Sacramento, the object being to show that many plants thought to be too tender for that section may be grown.

The Petaluma Poultry Show held last week, brought out the biggest exhibit ever made in that section. The President of the organization is H. C. Scrutton and the Secretary H. R. Campbell.

The complaint against the flavor of Humboldt County's butter which has been charged to the quantity of turnips fed there, has led to investigation as to advisability of substituting carrots for turnips.

The forest service is anxious to dispose of stumpage on the Plumas Reserve. There is an estimated stand of 12,500,000,000 board feet in the reserve, a large portion of which is mature and ready for sale.

The prices paid for butterfat by various creameries of Humboldt County for the last month were as follows: Capital, 36 cents; Central, 35½ cents; Grizzly Bluff, 36 cents; Swift & Co., 35¾ cents; Libby, McNeil & Libby Co., 36¾ cents; Sunset, 35 cents; Central Dry Milk Factory, 37½ cents.

Central California

Some Porterville oranges have commanded $4.00 a box.

Fresno County's Poultry Show was a complete success.

Fresno Nursery reports a great demand for Smyrna fig trees.

The packing houses of Porterville are rushing on oranges and lemons.

Tulare County has discovered a new and effective remedy for the thrips.

A Farmers Association has been formed at Patterson, Stanislaus County.

The Visalia Co-operative Creamery is elated over the receipt of a medal from the State Fair.

Fresno packers have succeeded in hammering the price of raisins to 3⅛ or even 3 cents.

One Exeter, Tulare County, olive grower has realized $500 per acre from his olive trees.

There are now five certified dairies in California, and Patterson, Stanislaus County, wants the next.

The Kerman alfalfa meal mill ground over 5600 tons within the past season. It paid the growers $40,000 cash.

The Dairyman's Association of Kings County is taking the initiative in organizing similar associations over the state.

Effort is being made to help along the formation of the Raisin Exchange. The latest feature is the formation of a promotion committee.

No plague infected rats have been found in California since 1908, but the state will take up a renewal of the rat fight in the near future.

Raisin growers have it in for food expert H. W. Wiley because in his model Thanksgiving dinner he omitted raisins from the menu.

San Jose Chamber of Commerce is taking up a suggestion for establishment of a branch of the Davis Agricultural School in the vicinity of San Jose.

Prunedale is claiming better prices for its Newton pippins than growers around Watsonville are receiving. It is claimed to be largely because of superior pack.

Orange shipments are keeping packing houses at Porterville, Lindsay and Exeter very busy. Some growers report as high as 75 per cent of fruit in the fancy grade.

Clovis raisin producers are appealing for the present legislature in special session called, to enact some law providing for the standardization of all California fruits.

Inspectors from the Pure Food Commission are observing packing methods in the Tulare County citrus section and it is thought a modification of the green orange ruling may be secured.

At a recent meeting of the organizers of the California Raisin Exchange at Fresno the following board of directors was selected: Judge M. K. Harris, H. H. Welsh, A. G. Wishon, D. L. Newman and W. R. Nutting.

At the recent annual meeting of the Farmers Union at Modesto a resolution was passed recommending the employment of white labor exclusively and urging the fixing of vacations so that public school pupils may be allowed to work in the orchards.

Southern California

San Bernardino is to have an incubator factory.

National City is to have another fruit packing house.

Southern California walnut growers are holding firmly for 14 cents.

Rialto orange growers propose to jail orange thieves in the future.

Orange County celery growers are finding this the most successful season.

Antelope Valley shipped many tons of turkeys to Los Angeles for holiday trade.

One walnut grower at Oxnard reports several tons of walnuts from 110 acres.

The whole state seems to be awakening to the profits in olive oil and pickles.

The San Bernardino Chamber of Commerce is exhibiting a 150 pound squash.

The Holtville Cooperative Creamery is paying over $2000 a month to its members.

The Tri-Counties Reforestation Committee is opposing the Water Commission bill.

Lima bean prices are soaring. The Ventura County Association still holds about 50,000 sacks.

The Holly Sugar Co. of Huntington Beach is contracting to pay $5.25 for next season's output.

County Veterinarian Rowland of Los Angeles, reports occasional cases of glanders in that county.

Prof. Lipman of the State University made an address before the Covina Farmers Club last Saturday.

The thirteen packing houses operating at Redlands will put out over 100 cars of oranges for Christmas trade.

Visitors who have returned from the land show at New York say that the California orange exhibit was magnificent.

Irrigators on the Ojai Road in Ventura County have been warned to stop letting their irrigating water run into the gutters.

Improvements in the main canal of district No. 5, Imperial Valley, will bring about 2000 more acres of land under irrigation.

A rhubarb grower at San Luis Rey, San Diego County, has been in Chicago looking for a market for his product of forty acres.

A slight frost over the Imperial Valley is said to have been beneficial in that it opens up the cotton bolls and makes picking easier.

Burbank, Los Angeles County, claims to have grown a sweet potato weighing 27 pounds. El Centro claims one weighing 75. Next?

The Palo Verde Valley has organized a Settlers Protective League, which will look after the interests of settlers in certain land contests.

L. R. Glavis, at the head of the State Conservation body, is looking after the state's interests in Southern California as to certain water power possibilities.

Santiago Orange Growers Association at McPherson, Orange County, shipped out a car of Thompson Improved navels for the Thanksgiving market. The Thompson Improved are earlier in coloring than the Washington navels.

The Coast

Oregon potato growers are holding tubers for a high price.

Most of the Idaho apples have now gone into cold storage.

Poultrymen held an exceptionally fine show at Salem, Ore., last week.

Farmers at Wilson Creek, Wash., are opposed to state highway building.

Fallon, Nev., will have a sugar factory in operation for next season's crop.

An apple grower at Boise, Idaho, has invented an apple grading machine.

The Oregon Agricultural College has issued a circular on gumosis of cherries.

A Camas, Wash., turnip grower has a specimen 19½ pounder, 33½ inches in circumference.

Fall planting of apple trees at Nampa, Idaho, has been more extensive than usual.

Hood River, Ore., is appealing for canning and drying plants which will handle cull apples.

The annual meeting of the Oregon Dairymens Association was held at Portland last week.

Farmers near Portland, Ore., are appealing for the creation of a state agricultural commission.

Angora Goat breeders and poultry raisers of Polk County, Ore., will hold a joint show at Dalles, Jan. 3-5.

Moscow, Idaho, is elated over capturing the sweepstake prize at the recent Spokane Apple Show.

The Pacific Northwest Livestock Show will be held at the Portland Union Stock Yards March 18-20, 1912.

Owing to a campaign for cleanliness, dairies near Portland, Ore., are said to be in the pink of perfection.

Lewiston, Idaho, is actively preparing for the meeting of the Northwest Livestock Association in that city Dec. 12-14.

Farmers at Echo, Ore., are in arms because of a large irrigation scheme which will store water and submerge their farms.

In a Portland, Ore., law suit the court made a ruling that a "sack" of potatoes shall be legally considered as 100 pounds.

A woman apple grower at Yakima Valley won $500 in gold for the best 25 boxes of apples in the New York Land Show.

A potato grower at Goldhill, Ore., claims to have a new tuber which will produce well in dry seasons and without irrigation.

At the recent Walla Walla Fruit Growers Convention a committee was appointed to effect a suitable marketing organization.

The Oregon Poultry and Pet Stock Association Show being held this week at Portland has an entry list of over twelve hundred birds.

White farmers near Gresham, Ore., are concerned over the great number of Jap gardeners and farmers who are securing possession of land.

Agriculturists of Mindanao, P. I., are urged to devote part of their acreage to rice culture. The land is said to be well adapted to rice growing, but at the present time the entire crop is purchased from outside the island.

A New Way to feed Alfalfa

HERE is the way to feed Alfalfa so as to produce two to six pounds more milk per cow a day—feed it with Steam Dried Beet Pulp

Alfalfa-fed cows are simply ravenous for Steam Dried Beet Pulp—a fact full of significance to the dairyman who studies his herd and pays close attention to feeding problems. He soon learns that alfalfa, though rich in protein, is deficient in carbohydrates, the element which Steam Dried Beet Pulp supplies. Cows, like mankind, crave variety in their feed, and they show their appreciation of Steam Dried Beet Pulp in the ration by giving a largely increased milk flow, with a higher per cent of butter fat.

Steam Dried Beet Pulp is light, bulky, succulent, easily digested, helps the digestion of other food, absorbs water quickly, swelling when moistened to six times its original bulk.

STEAM-DRIED BEET PULP
Just Like Roots
Makes More Milk

It is cheaper than bran or rolled barley and greatly outclasses them as a milk producer.

Steam Dried Beet Pulp is the clean beets from which the sugar factories have taken out the sugar, *dried by steam*. Steam drying insures clean, pure pulp, uniform in quality, appetizing in color. It is never blackened by smoke, never burned, keeps indefinitely. Packed in 100-pound sacks.

Your dealer should supply you and give you facts about this feed that is increasing the milk and butter production of the country. If he will not, write us, and we will see that your needs are supplied.

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

CO-OPERATIVE CREAMERY.

Being requested as to steps to take in the formation of a co-operative creamery, we have written to several qualified to answer such a question, and from Mr. Leon M. Davis, connected with the University Farm at Davis, we have the following:

"In reply to question as to whether these creameries are practical or whether they have generally succeeded, I will say that co-operative creameries are a success if under competent management. The only cause of failure in such concerns is the fact that the management is left to some stockholder whose knowledge of the creamery business is very limited. Especially in California, it is necessary that an experienced man be in charge of every creamery on account of the keen competition. I am going to refer you to Mr. W. B. Thurston, 407 Postoffice building, San Francisco. He is the Federal dairyman for this section of the country, and he is able to spend time with any dairyman who contemplates the establishment of a co-operative plant. Mr. Thurston is maintained by the U. S. Dairy Division and his services will be given entirely free. It will be necessary that he be requested to take up this work, as his services can not be given unsolicited."

Mr. J. P. Murphy, manager of the Dairymen's Co-operative Creamery at Tulare, writes:

"The first thing to be considered is the number of cows within a distance accessible to the creamery—two thousand being the least number to support an up-to-date plant.

"Second. Draw up a preamble or contract that is thoroughly legal and absolutely binding, secure the signatures of as many dairymen as possible who wish to join the association—from those signed up, elect five directors. The directors may then appoint a committee to draft constitution and by-laws.

"The next important move is to secure the services of a thorough creamery man as manager, the best man is none too good.

"The cost of the plant depends entirely on the capacity, style of building, machinery, etc. Our plant cost about $20,000, handles the product of 7000 cows—making over 4000 pounds of butter daily. The plant has been a most decided success with all patrons well pleased."

Mr. Murphy adds:

"The writer has been a creamery manager for over twenty years and during that time has had experience in co-operative creamery plants as well as privately owned creameries. We saw the co-operative creamery come into existence in California some twenty years ago—they sprang up in large numbers—seemed to be a success for a while, but any man familiar with the creamery business could see nothing in their future but failure.

"The co-operative creameries of those days were not started on substantial lines. Cheap buildings were erected, cheap machinery installed with no definite plan in view and the time was not long passing when the plant had to be overhauled—new machinery had to be purchased and the expense of the numerous mistakes that were made bore heavy and caused dissatisfaction and rancor among the dairy farmers.

"Then came the advent of the privately owned creamery commonly called the centralizer. It is needless to say that the co-operative creamery fell an easy prey to the shrewd business methods of the centralizer and one by one they sold out, burned down or went out of business, and the dairy farmer was much poorer and some wiser for his experience.

"Some few of the co-operative creameries that were started as long as fifteen years ago have survived and their existence is due to the fact that they were fortunate in securing a man as manager who knew the business and kept up to the times. The money that has been lost by hiring cheap, incompetent help in the creamery would build anew all the creameries in the state, and even to this day there is unnecessary waste of butter fat.

"But at last the co-operative creamery has come into its own. No longer is the dairy farmer, who put up his share of the money to build a co-operative creamery plant, shivering in his boots in fear that the amount he has invested is in danger of being lost—he fears not the keen competition of the centralizer, for he has learned that he and his neighbors with the help of a competent manager can run their own business without contributing a good portion of the profits of the dairy farm to private creamery owners.

"The dairy farmer is learning more about his own business as each day passes, taking better care of his product, putting his farm in a more sanitary condition, looking more closely to the improvement and health of his dairy herd, and taking a greater interest in his co-operative creamery, for he has learned that here is where the undivided interests of the farmer meet success."

ICE CREAM.

Twenty-five years ago a few far-sighted men induced Congress to provide for agricultural experiment stations. It is doubtful if any of them were long-headed enough to imagine that one of these stations would ever issue a long and scientific bulletin on ice cream. The Vermont Station has done this very thing in Bulletin 155, and it will rank as one of the most interesting and useful publications of all the stations. You probably do not realize it, but the ice cream trade is revolutionizing dairying in many places. The American consumer pays $150,000,000 every year for ice cream, and the demand has grown so that the entire product of many creameries has been taken from butter making and sold to make ice cream. In some cases the ice cream is made right at the creamery and sold as such. The comparative profits are figured about as follows: Take 100 pounds of cream, testing 18 per cent fat. This will make about 21 pounds of butter worth about $5.90. The same cream when properly mixed and frozen will "swell" to 20 gallons, which at 80 cents, means $16 or $15, deducting the cost of sugar. As butter the fat brings 33 cents a pound, as ice cream 83 cents. Quite a margin, you see, and thus far a few large manufacturers have bought the cream and worked this margin into their own pockets. There is little reason why some of this ice cream should not be made right where the

Warranted to Give Satisfaction
Gombault's Caustic Balsam

cream is separated. This bulletin tells exhaustively how it may be done, and does the job so well that it is deserving of high praise. Many interesting things are stated. For example, melted ice cream is mixed with a little skim-milk, soured and churned into butter! We also learn that "homogenized cream" is a new proposition. It is subjected to a pressure of 3000 to 5000 pounds per square inch. This so breaks up the fat globules as to prevent all cream from rising, the separator cannot get all the cream and it cannot be churned. It is possible with this process to make a fake milk or cream of any grade by reuniting unsalted butter and skim-milk! The ice cream trade is having a great influence upon the dairy business. It ranks in importance ahead of cheese and only second to butter. As it grows it is sure to influence the price of milk for butter making.—Rural New Yorker.

DAIRY HERD INSPECTION.

All herds from which a clean milk supply is desired should be frequently inspected by a competent veterinarian. Such inspection will prevent contamination of milk with many of the germs that are most dangerous to the human consumer, because these are derived from diseased cows.

Prevention is better than a cure, so inspection of cows is much more valuable than a laboratory inspection of the milk.

The milker should be clean. Before milking and before putting on his milking suit he must wash his hands with warm water, soap and a nail brush. The milker's hands should be washed before milking each and every cow. Starr's experiment station reports that 45,000 bacteria were found on the hand of an ordinary farm worker; about 98 per cent may be removed by washing.

A clean suit should be used, and must not be worn at any other time than at milking. It should be made of a washable material and should be changed at least twice per week.

Milk pails should be of smooth metal like heavy tin. Galvanized iron or any rough metal should not be used, as germs collect much more easily and they are more difficult to clean. In fact, all utensils should have the seams covered smoothly with solder. When the milking is done in a clean manner, strainers are of little use, but cheesecloth of the finest meshes doubled with a layer of absorbent cotton between the layers should be used.

No part of the dairy work is more important than the cleaning of milk utensils, or is so strongly emphasized that dairy utensils must, after the milk is thoroughly cleaned from the surface with warm water, be scalded with boiling water, or preferably steam. Nothing short of this will insure clean milk.—Dr. E. F. Jarrell in American Cultivator.

There is more profit in keeping one extra good cow upon the farm than sixteen scrubs. Her offspring is of much more value, her milk and butter products of finer quality, and her keeping just as nominal as of one scrub cow which produces but a dollar or two of profit, if any at all. The day of the scrub cow in the well regulated dairy is past, and these same unprofitable animals are fast passing from our farm dairies as well.—Geo. W. Brown.

Cleaning up manure and filth about the barn, and keeping rid of all rubbish and decay, will cause the flies to seek other carelessly kept barnyards. They only hatch where filth and dirt prevail.

Merced Colony
NO. 2

CALIFORNIA FARMERS are buying alfalfa land in Merced Colony No. 2. A large number have already bought and are now improving their places. Long experience with California soils has made these men keen judges of land. They know good land when they see it. That is why they are buying in MERCED COLONY NO. 2.

This land is in Merced County, in the San Joaquin Valley. It is all irrigated. Sold on very easy terms. Call or write today.

Escondido's Maiden Effort

San Diego County's Poultry Center is Proud of its First Show

The first annual show of the Escondido Valley Poultry Association was pulled off at Escondido, San Diego County, last week. The weather man showed his antipathy for the event by giving some exceptionally wet weather at the opening, but enough sunshine was granted finally so that the attendance proved very satisfactory. As to the quality of the birds shown, it was indeed a credit to the Escondido Valley. Rocks and Orpingtons were both exceptionally strong classes. Wyandottes were not so freely shown but some fine birds were on exhibit. The boys are determined to make another year's exhibit still better and to take advantage of the interest created by this showing to extend the belief in pure bred poultry over a greater range of San Diego County.

Corning Poultry Show

Tehama County's Exhibit Not Large, But of Fine Quality

The second Annual Poultry Show at Corning, Tehama County, has become history, and those who were responsible for the show have a feeling of satisfaction that such a successful exhibit has been made. It cannot be called one of the big shows of the state, as there were only 350 entries, but the fine grade of stock exhibited was a credit to the Tehama County poultry raisers. In the matter of quality, the Show was said to be far superir to that of last year. The judging was by A. H. Currier, a fancier of Santa Rosa. The attendance every day was satisfactory to the management and the exhibit closed with the determination to make next year's bigger and better. The officers elected are: George F. Atkins, president; Walter C. Smith, vice president; E. L. Randall, secretary; K. H. Cressman, assistant secretary; F. R. Close, treasurer.

Show Committee—W. C. Smith, F. R. Close, T. J. Moffit, W. B. Woodsoon, K. H. Cressman. Superintendent of exhibits, Will Atwood..

Oroville's Money Makers

Butte County Invites all the Sacramento Valley to Take Away the Prizes

With 750 of the aristocracy of California pure bred poultry in their proudest feathers proclaiming their own merit at the Oroville Poultry Show last week there was much to impress the throng of visitors from all parts of the Sacramento Valley that the North is some on blue blood. It was a fine show. The first of its kind at Oroville, but an inspiration to the lover of pure-bred stock.

The show was held in connection with the great Citrus Fair, so that the whole city was dressed in her best and with bunting and lights everywhere.

Nearly every class was well represented, and notwithstanding the Petaluma Show was held the same week, Oroville drew its share of fine stock.

MARKETING POULTRY.

"Trifles make perfection, but perfection is no trifle" is an old saying well worth remembering when you get ready to sell poultry. After a week or so in November it pays better to sell dressed poultry rather than live. Old hens usually bring the best prices in the early fall and winter, while old roosters do not pay for the labor and cost of sending them to market. In selling off the stock in the fall send only the small stock and the fat hens that do not lay. Old hens sell as well as pullets. The main point is to have them fat, as that covers all other defects provided they are healthy. Another important point is to dress them neatly. A neatly dressed fowl even if it be small, will always sell more readily than a large one with half of the feathers on, and bruises here and there. The keeping quality is greatly improved if the crop and intestines are empty, hence they should receive no food for 24 hours before killing. Bleed the fowl through the mouth. This is done by suspending it by the legs and with a sharp knife cutting across the mouth just below and under the eyes, in this way severing the jugular vein. A half minute will be all sufficient to bleed and when the bird begins to struggle, give it a smart blow on the back of the head and begin the picking at once. Most of the western markets prefer dry picked, while for many of the eastern markets it is immaterial, and there the prices often do not vary between dry picked and scalded. During the molting season, young stock will look and pay about as well if scalded as if dry picked. This should be quickly done in water nearly up to the boiling point, then pick perfectly clean, dip immediately into very hot water and then lay in cold water for fifteen minutes. If a little salt is added to the water it will draw the blood out of the skin. Many good chickens are spoiled by being packed before they are thoroughly cooled. Care should be taken that all the animal heat is out of the body before the fowls are packed. A bird with white flesh and skin is preferred by many markets to that with yellow. The color can be influenced considerably by the feed. Oats and skim-milk have a tendency to make them light colored. The farmer or poultry keeper who is in a position to do so will realize the most money out of his flock by selling direct to consumers and especially when this can be done a flock of one variety will command a better price than a flock of different varieties.—Kimball's Dairyman.

STIMULATING LAYING.

Hens should not be fed stimulants to promote laying, as the effects later on more than offset any gain one can make. Let the food, care and nature do such work and there will always be a supply of eggs.

It is a hen's nature to lay and, unless conditions are directly opposed to nature, they will lay. Stimulants of any kind rouse the system to action, but in time the after effects more than offset any good that may temporarily be gained. A little iron in drinking water is good, but pepper mixtures of any kind are harmful. The fowls should be much as they are in nature, and if other things are favorable the hens will lay. Hens that are covered with lice will not lay long, no matter what they are fed, so that our first duty is to free them of the pests. Small eggs may lie in a hen for months with no change if conditions are not just right, while on the other hand eggs may fully develop in ten days or two weeks if conditions and food are favorable. Breed has but little to do with laying and we can usually find the cause in some oversight of ours if our hens fail to lay as they should. Have a time to feed and feed right and you will have no complaint.—Farm and Home.

"Cull closely" is the motto that will lead to success.

LOS ANGELES POULTRY SHOW.

Great preparations are being made by the officers of The Poultry Breeders' Association of Southern California for their big show to take place at Fiesta Park, January 4 to 10, 1912. The premium list will soon be distributed. Special coops are being designed for the turkey and breeding yards exhibits, also 200 new coops for other poultry sections. One new feature of the show will be an official catalogue of awards. All exhibitors' names appear in this. The poultry will be cooped in single tiers with large alley-ways between the rows of coops. Seven judges place the awards in the persons of Wm. F. Brace, Victor, New York; Will Purdy, Ferry, Washington; H. W. Gunston, Havilah; Benj. F. Woodhull, Stockton; R. V. Moore, Oakland; Geo. W. Masterson, Duarte, and E. E. Emerson, Los Angeles. Liberal cash prizes are offered, besides ribbons and cups. Entries close Dec. 24th. For full particulars write to the secretary, Jos. E. Davis, R. D. 11, Box 148, Los Angeles.

GREEN BONE.

Generally we have from eighty to ninety chickens around the farm, and up to a few years ago I never kept track of just how much profit they added to the farm income.

I go into town about twice a week and, upon one of my trips to the butcher's, I noticed what a lot of bones he had gathered in a box, many with bits of meat clinging to them. When asked what he did with them he said he sold them to the "bone man" at a cent a pound. Then a thought struck me. Why wouldn't the lime and the marrow in those bones and the meat clinging to them be fine for my chickens?

The box of bones, weighing about seventy pounds, was bought, the butcher saying he would just as soon let me have them as the "bone man." The chickens like them immensely, but cracking and smashing bones with a hatchet for ninety chickens was more of a job than I thought, and I saw that if I was going to feed green bone to the chickens I would have to have a bone cutter. Then I hesitated. Was it worth it for my ninety chickens? However, after some deliberation I decided to take a chance on it and buy one, and I can truthfully say I have never been sorry for taking the chance.

Since using the cutter I have been keeping track of the flock's production and I have found that during the earlier part of the winter I have had an average of 1½ extra eggs each week from each hen, and during the latter part one extra one. This extra supply from each hen each week paid for the bone cutter the first winter and I have realized quite a side profit from it by renting it to the neighbors. Then, too, our pullets this year commenced laying earlier than they ever did before, and I lay it to the cut bone.

Our fowls have a good range, and each day I feed one quart of grain and one pound of cut bone for each fifteen or sixteen chickens. In the summer time I feed just the cut bone without the grain. We figured out this ration after feeding them too much a couple of times, causing them to get "off their feed" and to suffer with bowel complaint. Another time I let the cut bone get a little musty before feeding it and lost two hens.

At times I mix the green bone with a mash by way of variation, but I prefer, and I think the chickens do too, to give it to them straight. I generally scatter it in the straw litter when the weather is cold and there is a terrible scrambling among the fowls until it is all gone. The only precaution that need be taken, so far as I can figure it, is not to give too much or any that is tainted.—Farmer's Review.

Common baking soda dissolved in warm water to make a strong solution is a good wash for cleaning eggs. Soda will dissolve grease and dirt on the eggs. They should be wiped dry immediately after being washed.

There is an ever increasing demand for pure-bred poultry. Get a start this year and have some of your own to sell in the future. Big poultry profits are made largely through selling breeding stock.

As colder and damper conditions come on, look out for roup. Prevent this disease by keeping the houses dry, clean, and the sleeping birds unexposed.

THE VALUE OF DUCK EGGS.

Nearly all good eaters in England and on the continent relish duck eggs, even more than the hens' eggs.

Properly fed on sweet, clean grain, green stuff with pure water, the duck produces eggs that are delicious.

The Indian Runner duck lays better eggs than the Pekin, although the latter is in greater favor in the United States, doubtless because of its pure white color.

Pastry cooks in hotels and restaurants prefer duck eggs and some persons who have learned how palatable they are buy them, but there is a decided prejudice against duck eggs in the general market.

Duck raisers ran remove this prejudice by judicious advertising in the local papers, setting forth the advantages of duck eggs and advising as to their palatability.

The Indian Runner is almost as large as the Pekin at 10 weeks, although the latter is more heavily feathered, and this gives it a larger appearance.

Runner ducks do not need water to swim in, but should always be provided with clean water for drinking, and if this can be running water, so much the better.—Journal of Agriculture.

In constructing poultry houses it is better to build several small ones, and have them separated a considerable distance, than to build one large house. Large numbers in a flock are more subject to disease and pests than small numbers. Dividing the large flock into smaller groups gives wider and cleaner feeding grounds.

There is no economy in feeding musty grain of any kind to the chickens, even if it can be had for a quarter of the price of good grain. The fowls will eat it, if other food is withheld, but it is not good for them.

PROSPECTS OF THE POULTRY INDUSTRY IN CALIFORNIA.

Mrs. A. Basley.

The future of the poultry industry never looked brighter or more promising than it does at present. There is no boom on, but there is a steady and ever increasing demand for poultry and eggs at paying prices. There never has been a better opportunity for man or woman with push and energy and a knowledge of the business to go in and succeed than there is at the present time in Southern California.

There are scores of successful poultry raisers in and around Los Angeles who derive a good income from one or more of the branches of the poultry business and there is still plenty of room for others to go into it if they will apply themselves to the work. It is work, not play. But in Sunny California it means a health-giving employment in the open air and a good means of securing a comfortable income.

Scores are doing it. One, a noted poultry breeder in the East, wrote me: "Can I make poultry pay in California?" "You certainly can make it pay better here than in the East," was my reply. She knew the business and all she had to do was to adapt herself and the needs of her beautiful fowls to the difference in the climate and the soil.

"The food for the fowls costs somewhat more here than in Ohio," she said, "but eggs are forty-five cents a dozen here while they are less than half that there. So the difference in the price of one dozen eggs sold to the grocer here pays more than the extra price on a whole sack of wheat." "Thanks to the climate, poultry raising is easier here than in the East. If you want to know my greatest difficulty here it was at first in keeping the fowls supplied with green feed. My available supply of green gave out and I had to have recourse to sprouting oats or barley, but now that I know the climate and I can plan ahead there will be no difficulty whatever."

Poultry breeding is a business that can be made to pay on any scale from a small flock in the back yard of a town lot to a good many thousand on a poultry farm. Egg farms and poultry farms are becoming more numerous every year and thousands of fowls are raised in the back yards of homes here. Still one of the many markets in Los Angeles has just telephoned me that they alone are now importing a carload of eggs every week and a carload of poultry every ten days. The city of Los Angeles alone consumes over six million dollars worth of poultry per annum. Where does it come from and who gets the money for it? About one-half, three million dollars of this amount, is produced by the California poultry men and the ranchers' wives and daughters. The rest comes from the Middle West.

Why should not we produce the whole of this amount? Why should not our farmers keep the three million dollars in their own pockets? Why should they let this stream of gold go to other energetic farmers, or to people who know how to manage the business? There is no known reason why the business opportunities offered by our local markets cannot be utilized by the brains and capital of our farmers in the surrounding counties with their splendid natural resources.

The wonderful city of Petaluma with its two millions of hens is not able to supply San Francisco with the eggs and poultry she needs, and the San Franciscans are importing as many if not more carloads of eggs and poultry than the Los Angeles merchants. In considering the subject one of our experts wrote me "The increasing price of beef, pork and mutton have brought about conditions which cause the thinker to look admiringly at the hen for she is the only meat producer which can be relied upon to feed the people when our country reaches the congested state of England. The selling price of a pound of poultry meat or a dozen eggs is fully three times as much as the cost of production. Therefore after taking out the interest on the investment, the cost of getting it to market, etc., there is still a good profit left for the grower."

The process of producing poultry and eggs for table use is a very simple one and can be learned by any person with ordinary intelligence. The hundreds of home seekers arriving in California may be assured that they can keep poultry profitably, for pleasure, for family use, for the market, or for exhibition.

We are frequently asked what the profits may be in poultry, or what the net income from a certain number of hens should be. The profits of any legitimate business depend largely upon the owner. Prices fluctuate and profits vary, but the amount being realized here by a man who knows how to manage hens properly ranges from one dollar to four dollars per hen. This is for commercial eggs only.

The cost of keeping a hen of the American or English breeds is about a dollar and twenty cents per year. One expert I know tells me it costs him seven cents per month. He keeps the White Plymouth Rocks. Another, a beginner, finds it nearly two dollars a year, but he buys everything in small quantities. A hen of the American or English breeds eats from 75 to 100 pounds of food per year, voids about 100 pounds of droppings (value at about 35 cents for fertilizer) and lays on an average of ten dozen eggs per year, although many do better than this.

Thus the average hen brings in for eggs fully $3.00; droppings 35c; total $3.35. Cost of food a year, $1.20; net gain, $2.15. This is a very conservative estimate.

Two very careful poultry men who have been in the business for a number of years (one of them fifteen years) told me that ever since they began they have cleared over two dollars per year per hen from commercial eggs alone.

Commercial eggs as a business is undoubtedly the easiest and possibly the most profitable branch of the poultry industry, especially for beginners. The other branches, such as broilers, roasters, capons, and old hens all have good profits in the hands of the man or woman who knows how.

Broilers bring a good price when they can be supplied in large numbers under contract. Roasters and fryers

San Jose Hatchery
HENRY LANGENSCHWADT
Meridian Road **SAN JOSE, CAL.**

always have a good market while capons are becoming more popular every year.

The fancy business breeding and raising fowls for exhibition is increasing by leaps and bounds and we may fairly claim for California the best fancy fowls and some of the very foremost fanciers in the United States. There is no need and no use in sending out of this state to get good stock. It is right here and we are sending exhibition stock back to New York, Chicago and Boston and winning the blue there. The matchless climate of the West Coast and the energy and brains of our fanciers are producing the best fowls to be found anywhere.

Turkeys bring a high price in the market here. Turkeys have been called the farmer's friend and there is no doubt that turkey raising is, in some places, more profitable than any other branch of the poultry industry, and that they bring larger cash returns than any other stuff on the farm. They cost very little to raise, they eat the waste grains in the fields and barnyards, besides the seeds of many harmful weeds. They consume immense numbers of grasshoppers, grubs, worms and insects which would otherwise greatly injure the farmer's crops, and they are not difficult to raise if they are not overfed.

There are many valleys in California where grain crops are being grown and where the turkeys by thousands might be raised on the grain which has been lost by the reapers. In the last few years this industry has increased at least ten-fold in California. Flocks of several thousand are being raised in Imperial County, herded on the alfalfa fields like cattle. They do well in that hot dry country; thousands are being raised in the Antelope and San Jacinto Valleys, in San Diego and other places, but still there is room for many thousand more, and when one considers how much may be made, and what a large opening there is for this profitable business, the wonder is that so few are raised; not nearly enough to meet the demand. Last year at Thanksgiving and Christmas, turkeys were selling at from forty to forty-five cents per pound, and were being shipped in from Kansas and Nebraska by the carload. This year they bid fair to be the same price, showing what an immense profit there is in the business. While there are no wild turkeys to be found in California except those that are being brought here by the government, the climate is excellent for the tame turkeys, and so far there has been very little disease among them. In sections of the East we read that a disease called blackhead has almost wiped out the turkeys, but here there is no need of sickness among turkeys, and I think eventually, California will supply the eastern states with their Thanksgiving and Christmas dinners.

Ducks do not seem to be as popular as chickens in California. At least there are no such large ranches here as there are on Long Island. There is, however, a wonderful outlook for them. Ducks grow faster and are ready for market earlier than chickens; they are not troubled with the diseases of the hens, neither do they have lice except when raised under a hen. When very young, before the feathers grow, the gray head lice may get on their heads, but this is before they feather out. Mosquitoes which are troublesome in some places to chickens, never trouble ducks, neither do fleas nor ticks. The reason for their immunity from vermin is that their feathers are very oily and thick, and the down under the feathers is an extra protection. Hens require a dust bath, while ducks require a water bath to keep them clean and healthy.

Most of the popular varieties of ducks can be raised and bred without water to swim in, but on the very large duck ranches, a supply of running water, so they may have fresh water to drink and a bathing place for the breeding ducks is of great advantage.

There is a good market for ducks here, and they are used extensively by the Chinese, who, if they cannot get fresh duck, use the imported smoked duck sent over from China. Ducks bring from eleven to fourteen cents per pound and still higher for what is called green duck. These are the young ducks that have been fed and fattened and made ready for the market at eight to ten weeks of age, weighing at that time from three to four pounds. All the different varieties of ducks do well in California.

Geese, like all other of the domestic fowls, can be profitably grown in California. There is always a market for them, and for their feathers. Geese are grazers. Grass, alfalfa and weeds form the greater part of their food. They do not do well on grain alone, any more than would sheep. If given a dry place to sleep in, they can live and thrive on low marshy ground suitable only for water fowls.

Goose-growing is nowhere in California carried on as an exclusive business, but many ranches keep a few for their own home consumption. There is always a ready market for them, and the prices are from fourteen to twenty cents per pound, according to the season. The present supply of good stock does not equal the demand, and any one situated favorably for raising geese, not far from Los Angeles, would, if reasonably successful, make a very good profit on as many as he could conveniently raise. The feathers always bring a high price, and many people who do not keep geese at all could do so with profit.

WHY HENS CACKLE.

My theory follows, says Breeder's Gazette: The jungle fowl of India, from which all our domestic hens are descended, lives where many predatory animals and reptiles also find their homes. The female jungle fowl for this reason seeks a secluded and safe place in which to deposit her eggs. When she is ready to produce an egg she retires to her nest and broods there for some time. In the meantime her mates have wandered away from the place where she left them. Probably several hens are absent from the flock attending to their maternal duties at the same time. When the egg is deposited the hen quietly goes to a distance from her nest and then begins to cackle in order to announce to her chief that the necessity for concealment no longer exists. The cock at once begins to cackle and the hen knows where to find the flock.

As to whether to expect eggs from your pullets this fall and winter depends upon how early they were hatched and how rapidly they have been pushed to maturity. A pullet does not begin to lay till she is mature, or nearly so, and if real cold weather comes before that time she is not apt to lay till the last of winter or next spring. If the pullets were hatched rather early last spring, and are now mature, healthy and vigorous, they are ready to start to lay. Good feeding and care will do the rest.

Lee's Egg Maker

Are your hens laying *now?* If not, are you doing your part in furnishing proper feed. Protein—*digestible* protein—is the feeding secret. It's a simple matter to get food rich in protein, but the percentage of it that is *digestible* is the thing to consider. Lee's Egg Maker is almost a pure meat product, clean, sweet, and wholesome, and contains more protein in *digestible* form than any other meat product. Successfully replaces all other kinds of meat food at *less* feeding cost and better results. That's our *guarantee.*

Prices 25c to $7.00, according to size.

GERMOZONE

is the best health-insurance you can furnish your fowls. Indispensable as a remedy for *Roup, Colds, Chicken-Pox,* and other poultry ailments. Disease in your flock now will probably mean diseased birds all winter and poor breeders in the spring. Germozone twice-a-week tones and builds up the system, destroys disease germs, insures better and healthier stock *now* and strong, vigorous birds for the breeding season. Best guarantee *against* disease; surest remedy if disease has already taken hold. *Either tablet or liquid. Price 50c.*

Lee's goods are on sale in almost *every* town, but if yours is an exception send your order direct to us and ask for our *free* offer.

GEO. H. LEE CO.,
225 W. 2d St., Los Angeles, Cal.

Send for your *free* copy of Lee's New Poultry Book. Interesting; instructive. The "best yet."

FARM LANDS FOR SALE.

For Sale—
BEAUTIFUL "OAK DELL HOME."
No. 666 Cal.—Situated 3½ miles from the thriving town of Escondido; contains 132.44-100 acres, about 30 acres of alluvial soil around and near the house, several acres more of good land on different parts of the ranch. Many beautiful live oak trees on the ranch, and one especially fine, standing in the front yard; splendid well of water with windmill and tank; brand new bungalow of six rooms, modern and well built; new barn, 20x37 feet, 16 feet to comb; store room, 12x32, divided into three rooms. Stone house 10 feet square in the clear with cement floor, thick walls, making a cool place to keep canned fruit and milk. Good woodshed. One of the desirable features of the bungalow is a fine chimney and fireplace. Abundance of wood on the place makes this desirable and practical. There is abundance of living water in the creek that runs through the place; this is one of the most desirable features of the place. This place is truly one of nature's beauty spots, and would be fine for a resort. Must be seen to be appreciated. The mountainous land is fine for pasture. F. J. Conrad, "the Hustler," Escondido.

WILL YOU BUY A HOME
In one of the best colony districts of the State? We have sold many 20-acre tracts in the last three weeks to people who have inspected the land, and they pronounce the land first class and the conditions ideal.
There is plenty of water, creamery, cannery, churches, schools and packing houses.
Close to 4 Railroad Stations.
We want the right people and will make terms to suit, and, if desired, will accept part of crop each year after first cash payment until land is entirely paid for.
ORCHARD AND FARM LANDS COMPANY, 309-310 Stimson Bldg., Los Angeles.

For Sale—LINDSAY ORANGE LANDS.
Eleven days before Christmas the fourteen packing houses of Lindsay sent out pay checks for the 1910 navel orange crop. Lindsay orange district had the holiday orange market all to themselves, and of course they sold at good profit.
Why not invest in some of this Lindsay orange land and get the benefit of rapidly advancing prices?
Ten-acre tracts in Lindsay, $150 per acre, on easy terms.
Choice Tulare alfalfa lands, water in abundance; any size tracts, $50 per acre up.
KIOUS-WHANN REALTY CO.,
235 Mason Bldg., Los Angeles. A4164.

For Sale—160 acre ranch, 2½ miles southeast of Poplar, Cal., 8 from Porterville; 5-room house, two barns, granary and shop; good well water; water right, with ditch running across ranch. Especially adapted to raising alfalfa and deciduous fruits. Citrus fruits grown on adjoining ranches. Being unable to locate on this ranch myself, I will sell at the bargain price of $60 per acre. Will consider exchange for property near Whittier, Cal. Address owner, H. F. Stubbs, 141 S. Comstock, Whittier, Cal.

170 Acres—¼ mile from R.R. station and school, $30 per acre. 100 acres in crop; more can be planted to trees or vines. Partly warm citrus soil or for winter gardening; some alfalfa land; well 50 feet deep, 10 feet across, water 8 feet from surface; all under fence; no other improvements. Terms $3000 cash, balance at 7 per cent; will not trade. Address C. F. Haney, Escondido, Cal.

Choice Orange Land, Exeter District—63 acres, 3 miles south of the town of Exeter, California, three-quarters of a mile from Southern Pacific railroad station, right in the foothills, leveled, water developed on it. Write for particulars. The Phalanx Company, 513 Chamber of Commerce, Los Angeles, Cal.

For Sale—

GEESE

White Emden Geese—Always healthy, easily raised, best for feathers and flesh, $3 each. Both phones. Leslie F. Gay, East Los Angeles.

CONIFERS FOR CALIFORNIA.

(Continued from Page 615.)

sider is good for street planting. Many believe the Sequoia to be very slow growers; this I have found to be wrong. The Redwood is around Los Angeles among the very fastest growing conifers we have, and S. gigantea if planted in a congenial soil (away from hardpan) will soon make a handsome specimen.

I have omitted the Retinosporas as being quite unsuited for general use here. The Thuyopsis can be grown fairly well, but I do not believe them to be very long lived here, and unless planted in a cool, shady position, soon become thin and sunburnt. Sciadopitys verticillata I find also short lived and inclined to become thin in a few years. There are still a few thousand I have not mentioned.

Regarding the Cedrus deodara, we may add that in the discussion after the delivery of Mr. Reeves' paper several nurserymen dissented from the view expressed that it was really Cedrus Atlantica glauca. Mr. Payne, Mr. Braunton, and others maintained that seed offered from France under the name of Cedrus deodara always produced the tree generally known as deodar. In any case it passes in the trade under that name and is a wonderfully beautiful tree.—Ed.

Bees and Their Care

HOW I FIND THINGS IN SAN DIEGO COUNTY.

By Z. Quincey, Inspector of Apiaries.

During the four years of my incumbency as inspector of apiaries it has been my pleasure to examine thoroughly 565 apiaries aggregating a little over 50,000 colonies.

The first two years I was more or less discouraged to know fully a third of the apiaries were infected with foul brood, finding from two or three to one hundred and forty-five diseased colonies in an apiary, and the latter in an apiary of one hundred and seventy-five others almost as bad, with infected combs strewn all over the ground or hanging in the honey house ready to help build up a swarm or divide, and worst of all, little co-operation on the part of the apiarists to assist in eradicating the disease. But I was determined that it should be cleaned up if at the cost of a whole apiary, which of course I never had to do. Out of the 2075 infected colonies cleaned up, I have not burned up over 300, and then only those found so late in the season that I was sure they would not survive if treated.

After the first two years I began to find apiaries previously treated were either free or nearly so from disease, then nearly every one was willing to assist. Now I can truthfully say there are not over eleven apiaries infected in the county, and those but slightly.

The past four or five seasons have been very unfavorable for a flow of nectar, owing chiefly to lack of moisture and late cold weather, especially so on the coast or up to an altitude of from 120 to 1500 feet. Above that and up to 3750 feet the flora was later; consequently the weather had settled and bees could get out to gather the little nectar secreted. A good many of the apiarists were quite discouraged, but whoever saw one wholly so? They are always living in hope that next season may prove a bonanza. The western part of the county, or what we term the black sage district, is run mostly for comb honey, the northern, eastern and northeastern portions are fitted for extracted honey.

I find a conglomeration of hives and frames, there being five different sizes. A number of our apiarists keep in touch and up-to-date with their chosen work, while others work their bees as they did 35 or 40 years ago, or let the bees work to suit themselves. My hardest lot is to try and induce the latter that a change of blood is as necessary in an apiary as in a poultry yard, and that at least half of their apiary should be requeened. They claim a queen is good until she dies, yet I may find fully one-eighth of their colonies useless and if I attempt to kill a drone layer or cripple and requeen, I have my hands full.

Another great detriment is that the majority extract too close in the fall, causing a dwindling before spring from which a great many colonies succumb. Again it seems to be an impossibility to induce the majority to stimulate and get their colonies strong for a flow of nectar. Also we insist on keeping too many colonies in one apiary. We still have fine ranges unoccupied, although isolated, where a good crop could be secured every season.

Many apiaries are not successful because bee keeping is a side issue; all the other work on the farm must be attended to first and the apiary last, if at all. I have known men to say in June, "I am glad you are here, I haven't even looked at my bees since I robbed them last season, and I am so busy I can't go with you. Just go in the apiary and mark every hive you think needs attention. I will try to put them in shape in a week or two." Do not think every one is so negligent, for I can assure you some are models, very methodical and systematic, nearly every comb being perfect. They examine their apiaries every few weeks, requeen more or less each season, build up all weak colonies, stimulate and strengthen their colonies before the honey flow. I inspected 600 colonies for one man, and a more uniform lot one could not find should he travel the world over, not a weak colony, not a poor queen, nor a poor comb, and that man always made honey.

We have no organized association and it is hard to get the bee men together as they are scattered over such a vast area. There are few apiaries located near any settlements, the land having been cleared and cultivated, so reducing the flora that there was barely a living for the bees, let alone a surplus for the owner. Therefore a great many have either sold their apiaries to men who have moved them further in the mountains or they have done so themselves, and I find by talking to them that they could not stand the expense of a three or four days' trip with team to attend an institute held perhaps 50 to 70 miles away.

AN INNOVATION IN IRRIGATION.

Originally all Southern California (like other sections of the country) was using the open ditch for irrigation purposes—with the exception of isolated cases where water pipes or concrete ditches were being tried. About eight years ago, however, two practical ranchers at Covina, California, made some concrete pipe and formed it into a distributing system—with gates to control the flow of water and outlets with valves to distribute it. This innovation in the manner of carrying and distributing water proved so practical and economical that it was at once adopted by ranchers generally, with the result that it practically revolutionized irrigation emthods throughout Southern California.

It saves water, land and labor, and will last a lifetime—concrete pipe conduits that have been in use for twenty years being today absolutely as good as the day they were installed. This system is rapidly finding its way all over the Western country—resulting in the upbuilding of an immense industry at Los Angeles, California, The Kellar-Thomason Mfg. Co., of which the original inventors are still at the head.

AN IDEAL HARROW.

In considering the purchase of a harrow it is advisable to look into the merits of those offered. Up to date farming demands the greatest possible conservation of time and energy, and when anything in the farm implement line shows a saving in these particulars it is certainly worth considering.

A real, modern harrow is now made and offered to the readers of The Cultivator by the Chilson Automatic Plow Company. You can see an illustration of the harrow in this issue. It is well made from seasoned oak, and the pins are thoroughly tempered. But, aside from the rigid and perfect construction, it is automatic in operation and does not require the exercise of great strength in handling it. A pressure on a foot pedal is all that is needed to lift it from the ground, at which time it cleans itself. You ride this harrow while working.

This implement is appreciated by those who know the value of a machine of this kind. It will pay you to write for further particulars to the manufacturer.

A GIFT WITH A THOUGHT IN IT.

What other Christmas present costs so little and means so much as a subscription to the Youth's Companion—52 weeks for $1.75?. It is a gift which benefits not only the one who receives it, but every member of the same household.

The one to whom you give the subscription will receive free the Companion's Calendar for 1912, lithographed in ten colors and gold, and you, too, as giver of the subscription, will receive a copy of the calendar.

"Nothing like it has ever before been invented," is what the manufacturers say of the automatic cream separator, crankless and gearless. "Separates milk perfectly faster than ten men can milk it. It is simply started when milking begins and it does the rest." It is promised that it will run for hours without the slightest variation, and some go so far as to say that it will revolutionize the business. This invention is handled by the Arnott Co. of Los Angeles. Dairymen should get next and ask for the "Story Without Words." The address of the Arnott Co. is 112-118 South Los Angeles St., Los Angeles.

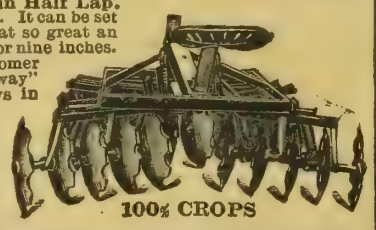
PAYS FOR ITSELF EVERY THIRTY DAYS

CUTS THE SOIL TWICE

Without a doubt Clark's Double Action "Cutaway" Harrow with Jointed Pole is a most wonderful farm tool. It cuts the soil twice, throwing it in opposite directions, filling in the hollows, thus leveling the land **All Single Action Harrows have to be Driven in Half Lap.** It is drawn by two medium horses. It can be set to move the earth but little, or at so great an angle as to move the earth eight or nine inches. Runs true in line of draft. A customer wrote recently that his "Cutaway" pays for itself every thirty days in labor saved.



The Jointed Pole takes all weight off the horses' necks, and keeps their heels away from the disks.
We make a "Cutaway" for every crop. Every need is fully supplied by the different styles of genuine "Cutaway" Tools. If your dealer won't supply you, we will.
Write us. "Intensive Cultivation," our new booklet, is free. Send a postal to-day.

Questions and Answers

THE EDITOR AND STAFF

Trespassing Poultry.

I noticed in a recent Cultivator a notice regarding an article regarding trespassing stock. Does that law apply to poultry and does one with a garden have to fence against them or allow them to destroy the crop?—Subscriber, Exeter.

Unfortunately under the present state law unless one surrounds his place with a "substantial fence" no damage can be collected because of trespass. As to what constitutes a substantial fence we believe there has been no decision. We do not think it necessarily means a chicken tight and chicken high fence. The estray law still stands and stock which is trespassing may be taken in charge and placed in the pound.

Horse for Farm.

What breed of horse is best for general farm work; also best to raise for market purposes?—Subscriber, Tulare.

The best breed to use upon the farm, of course, depends upon the circumstances and work required. For general farm work with an occasional drive to town the medium weight American horse is perhaps the best. If a driving team is possessed then the work on the farm might be more economically accomplished by the use of a heavy draft team such as the Percheron, Belgian, Clyde or Shire. As to which would be best to breed for profit we are uninformed. If numbers now in the United States indicate, the favorite is the Percheron. The best way is to consult the market to be supplied and get the information at first hand.

Co-operative Creamery.

A subscriber recently requested information as to steps to take for the formation of a co-operative creamery. We would refer to an article under that head in the dairy and livestock department of this issue.

Leaf Cutter.

A subscriber recently sent us rose leaves with circular pieces cut from them. The leaves were forwarded to Prof. H. J. Quayle at Whittier, and he writes:

"The rose leaf from Lakeside indicates the work of one of the leaf-cutter bees, belonging to the genus Megachile. This insect, while it does occasional conspicuous damage to the rose, never becomes important enough to warrant doing anything in the way of control measures. The insect makes tunnels in the pith of plants and cuts out these uinform pieces of rose leaves for the purpose of lining the tunnel and separating it off in definite nests, in which an egg is deposited, together with pollen for the issuing larva to feed upon. I do not know whether the bees actually eat some of the substance of the leaf in the operation or not, so that we are not sure that a poison spray, which would be a possible remedy, would be at all effective. I shall not, therefore, suggest any treatment, for I know of none that is practical or satisfactory."

Stick Tight Fleas.

A correspondent at Valley Center sends the following:

"Let me tell you how these pests can live in a chicken yard. The chickens may be well-fed and some may look well and seem well, but there is negligence on the part of the owner generally about keeping the house and yard thoroughly clean. Now I can tell you how to rid your fowls of the stick-tight fleas. First get a 5-gallon can of distillate and one also of crude oil, costing 50 cents each per can. Mix equal parts, stirring thoroughly; then spray the hen houses and small pens thoroughly and then dig up the ground over which the hens run, and this repeated once in two weeks will rid the yard of these pests.

"To get them off the poultry, each fowl should be caught and closely inspected and cleansed by using distillate on their heads where the fleas stick. This should be repeated at least once in ten days until the fleas are destroyed. Ridding the soil by stirring it well is most essential, because they breed in the dust and dirt and thrive mostly in a very dirty yard. I have seen some experience in this treatment for all lice and mites and fleas on chickens."

Stock Beets, Etc.

Are stock beets with some grain good feed for brood sows? Can cotton seed meal in small quantities be fed with safety, mixed with rolled barley, to horses? Is Kaffir corn equal to cracked corn or feed meal for hogs, stock beets being the staple with a little alfalfa? At what age is a boar fit for service, also bull calf, both pure bred.—Subscriber, Riverside.

Stock beets are excellent feed for stock hogs. The flesh is softer than grain fed animals, but for breeding stock this is an advantage. The young are born more vigorous and the sows have abundance of milk. I cannot think of any food I would rather have an abundance of than beets for breeding sows and the young shotes. Feed some alfalfa hay with the beets, and the pigs will grow like weeds. Gebek writes a bulletin in which he gives as a successful ration for draft horses a mixture of two pounds of cottonseed meal mixed with oats and corn. I presume he gives two pounds as the desirable amount to use daily. There is always danger in overfeeding with these concentrated rich foods. I would begin to feed cottonseed meal by using half a pound daily in the ration of rolled barley, shortening the barley up three times as much in quantity as the cottonseed meal is used. The proportions that are safe with linseed meal we have found to be two pounds to eight of rolled barley. I would not make a mixture any richer than that for any animal. In feeding Kaffir corn equals barley rather than Indian corn. It is a litle under the best barley, and when used with alfalfa hay it is not quite as perfect chemically in balance as corn with alfalfa. I think, however, it feeds out to cows and hogs a little better in the way of increase in fat than rolled barley. The stock are fond of it, and that may make a difference. Service means quite a different thing on different farms. If the boar is well fed at six months old he can be used for a sow a week without injury. A ten months old bull will also be used for six to ten cows not oftener than once a week. I would not exceed six. These animals must be well grown and well fed to do this safely. I prefer older ones, but when one has only a few head it is rather necessary to use them sooner. A yearling boar and a two year old bull are ready for full service.—M. E. S.

Seed Production.

Will it be profitable to raise garden seeds for market on ten acres? What kind of seed is there any money in? Also, would it be necessary to contract with wholesale firm, or dispose of them on my own account?—Subscriber, Stanislaus County.

Seed growing is a science, and one should not enter into it extensively without very thorough knowledge. To produce ten acres of some garden

seeds would require considerable capital. As to what variety to produce, it would depend upon the section. Presumably the production which does best in one section would also be a profit bringer in the production of seed. Stanislaus County has been a great producer of watermelons, also of sweet potatoes. This possibly offers a hint. The California poppy seed is also popular. As to what would give the greater profit we cannot answer, for that may be best determnied by correspondence with large seed concerns which make a business of disposing of the produce. We would under no circumstances enter into seed growing without having secured a market in advance.

Alfalfa Between.

I have a piece of land in Owens Valley now in alfalfa. I wish to plant apples. What preparation will be necessary to get soil ready for trees? If I plow a strip say eight feet wide and harrow down thoroughly, will that be sufficient? I wish to grow alfalfa between the tree rows for a year or two.—Subscriber, Salinas.

Our preference would be to deeply plow the entire alfalfa field and prepare the soil thoroughly, yet we realize where a good stand of alfalfa is on the ground the temptation would be strong to secure the income, and if water is in sufficient supply it may be done without material injury. It must be borne in mind that alfalfa takes considerable fertility from the soil. We appreciate that it is a legume and is sometimes credited with "enriching" the soil, but a crop which allows the removal of five to ten tons per acre per year is certainly taking fertility from the lower depth, being a deep rooter, but so do apple trees, so unless this alfalfa is fed on the place and fertility returned, soil exhaustion will come quicker than if no alfalfa is grown. If we were to plow in strips we would plow two rows at a time.. That is, instead of back furrowing or dead furrowing, we plow one way on one row, then back on the next. This leaves the land more level.

Alfalfa Tea.

In an issue of the Saturday Evening Post, I think during September, there appeared an article by a large and successful hog raiser in Montana or Wyoming, in which he wrote of the value of "alfalfa tea" for pigs. Can you tell us through the Cultivator what alfalfa tea is? How is it prepared and fed to pigs? Is it a substitte for milk?—R. W. C., L. A.

Mrs. Sherman answered a similar query about a year since as follows: Prepare alfalfa hay tea by putting hot water on a quantity of alfalfa leaves. The floor of the barn mow has plenty of loose leaves that are good for this use. We usually allow a two quart can full of leaves to each gallon of water. Steep it the same as any other tea. We prefer to use barley with it, as the wheat bran is too much on the protein order to work as well with alfalfa hay as rolled barley. This is cooked into a mush. Bring it to a boil and then bury it in a hay box so that it will cook all day. If one pint of rolled barley is cooked in a full quart of water in a tightly closed can the mass will be mush. To each quart of the hay tea add at first a teacupful of milk and a teacupful of the mush. Gradually drop out the milk and increase the tea to cover the amount withdrawn.

Catching Gophers.

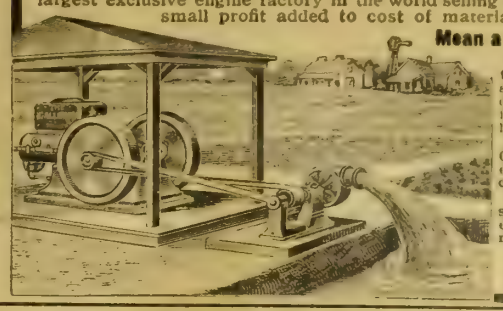
Have tried traps and poison for gophers. Would now like to ask if carbon bisulphide applied as follows will be effective: Where there are fresh signs of dirt but the hole is so big that it cannot be found, pour an ounce of carbon bisulphide and cover it close with dirt, that is, will the fumes keep on going down and destroy the gophers?—M. E. F., Goshen.

We think not, and would prefer traps and poison. The pests sometimes pack their holes for some dis-

GALLOWAY

Pumping Engines and Centrifugal Pumps

MAKE the most economical and efficient pumping outfits on earth where large quantities of water are required. Galloway Pumping Engines are made in sizes to suit every purpose from 1½ h. p. to 15 h. p. They are built on honor, and so powerful, simple, economical and reliable that they are acknowledged everywhere as the most all-around satisfactory gas power possible to obtain. They are built in the largest exclusive engine factory in the world selling direct to the consumer with just one small profit added to cost of material and labor.



Mean a Saving to You of From 40 to 60%.

Galloway Centrifugal Pumps on account of the high efficiency obtained, their exceptionally simple design without valves or other complicated mechanism of any kind, are the ideal pumps for irrigation purposes or where large quantities of water are required.

A combination of Galloway Engine and Galloway Centrifugal Pump means ideal equipment at a great saving in price as compared with competitors' prices.

Write us for full information. We have a special department for irrigation work with experts ready to work out your requirements.

Harrow While You Plow

Put your ground in perfect condition for planting at one operation — by using the Racine Rotary Harrow Attachment for Plows. Readily attached to gang or sulky plow. Follows the furrow and cuts, packs and smooths the soil, keeping in moisture and leaving no ridges.

You know that the best time to harrow is immediately after the plow has turned the furrow—before the sun and wind have a chance to dry out the soil. That means — harrow while you plow. But you must get the right harrow if you want best results.

THE cutting blades of The Racine Rotary Harrow Attachment for Plows are curved. They cut throughout their full length—not simply at the point. Positively cannot clog or wind—self-cleaning. Bury the trash and litter well under the soil instead of dragging it around to the surface as do ordinary blades. If your dealer can't supply you, write direct to us for handsomely illustrated circular. Find out about this big labor-saver—today. A postal will do.

STATE OF CALIFORNIA, }
County of Los Angeles, } ss.

I, W. T. S. Hammond, Cashier of the above named bank, do solemnly swear that the above statement is true to the best of my knowledge and belief.

W. T. S. HAMMOND, Cashier.

Subscribed and sworn to before me this seventh day of December, 1911.

W. N. HAMAKER, Notary Public.

Correct—Attest:

STODDARD JESS, W. C. PATTERSON, JOHN P. BURKE, JOHN S. CRAVENS, FRANK P. FLINT, J. O. KOEPFLI, Directors.

tance back from the loose surface soil and are most ingenious in concealing the entrance to runways. Applying the carbon as suggested would not catch one out of 1000. In fact, we do not think even with the hole opened up that fumes would reach down so as to destroy a great number of gophers. Their runways are so extensive that they might be long distances from the poisonous gases.

Better Kill Him.

I have a Rhode Island Red cockerel lame since hatching, has never walked. Has good appetite, seems to be healthy, is now 7 months old and weighs 3 lbs.; is a pet. What can I do with him?—Subscriber, National City.

If you are very fond of the little cockerel you might keep him as a pet, otherwise you had better eat him. Three pounds is under weight, and you could never breed from him.—Mrs. A. B.

Moles.

What is the best way to get rid of ground moles? They are pests in this section.—Subscriber, Los Gatos.

If the subscriber means the ordinary mole which lives only upon insect life in the ground, there is no more serious injury from him than the disfigurement of the surface of lawns and the garden. The only way to catch them is by traps, and the ordinary double-jawed trap works to perfection. This trap is so arranged that as the mole passes through his runway he releases the trigger, and no matter which direction the mole is coming from, he is caught on one set of jaws or the other. It is not possible to poison them, for, as noted above, they live on insect life only.

Veterinary

Answers in this column by Fred G. Matthews, M. S., D. V. M., 1233 Central Ave., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Cowpox?

A young cow, with her first calf, has sores all around the top of her teats. She has had this trouble about a week and some of the sores have bursted. The sores seem very painful. —Subscriber, Tulare.

Take two ounces of gum camphor and add pure carbolic acid, drop after drop, till the camphor is nearly but not all, dissolved, and apply the solution to the sore places, once daily, with a feather.

Summer Sores.

A colt, three years old, has raw sores from the size of a dollar to three inches across, on each foot above the hoof and about the fetlocks. I have been doctoring them all summer with pure carbolic acid, burnt alum and other remedies. He seems to itch a great deal. I am told they are incurable, but decided to write the Cultivator.—Subscriber, Orange.

The summer sore, bursatti, is very difficult to cure. Cleanse the sores of all scabs, matter and blood, and rub powdered bichloride of mercury into the raw surface only, remove the scab after three or four days and repeat. When the sores are level with the healthy skin, wrap strips of burlap around the limbs, as bandages, covering the sores. Keep these bandages wet with a solution of five per cent coal tar disinfectant.

Leucorrhea.

When my mare had a colt last June there must have been some injury to the vagina, as a white matter passes from her. She seems to be in perfect health with this exception, and is doing hard work.—Subscriber, Sanger.

Mix alum six ounces and boric acid two ounces; dissolve one level teaspoonful in a quart of warm water, and inject it into the vagina. Use a fountain syringe and make one injection daily. Have your druggist mix Fowler's solution six ounces, fluid extract nux vomica two ounces and fluid extract black haw four ounces, and give two tablespoonfuls (one ounce) twice daily in the feed.—F.G.M.

Unthrifty Cow.

A cow, which calved about one year ago, came in ten days ahead of time, but cleaned properly, has not done well all summer, and gives only a small amount of milk. She had three or four surface sores on her front legs all summer. She has the habit of licking herself all over, but I can find no lice or other cause for the habit. I feed alfalfa hay alone but recently added a little bran and gave condition powders. She does not eat as well as usual, lately.—Subscriber, Riverside.

A definite diagnosis cannot be made from the symptoms given. Cows which acquire the habit of licking themselves often have hairs accumulate in balls in the rumen and indigestion may result. Change the feed and allow the cow a liberal supply of salt mixed with an equal amount of hardwood ashes to lick. I would dry the cow off for her own benefit. It would be advisable to get the opinion of your local veterinarian on this case. Purge once a month with Epsom salts one pound, dissolved in a quart of water, as a drench.—F. G. M.

JULIANA'S FIRST SALUTE.

The little Princess Juliana of Holland is said to be growing into a most delightful little girl, simply and sensibly brought up and well and strong. A pretty little story was told of her first appearance in public. It was this: When she was first taken out to ride in the palace gardens the passers-by saw only a nursemaid and a baby and no special notice was taken of her. Then a young sentry on duty suddenly realized that this same baby-carriage contained Her Royal Highness Princess Juliana Louise Emma Marie Wilhelmina, heiress to the throne of Holland. He saluted solemnly, and as it happened the tiny Princess's father was looking out and saw the first salute given to his small daughter. The young sentry was sent for and presented with a gift as a souvenir of the occasion. The little Princess was born in the spring of 1909, so she is now nearly three years old.—Harper's Bazar.

Boil oyster plant, parsnips and such vegetables with thin skins on; then peel when cold. The flavor is preserved, and your hands are not stained.

American Pumps Again Selected for the Patterson Ranch

The Reason Why

Because the success of the whole project depends on the successful operation of the eight pumping stations.

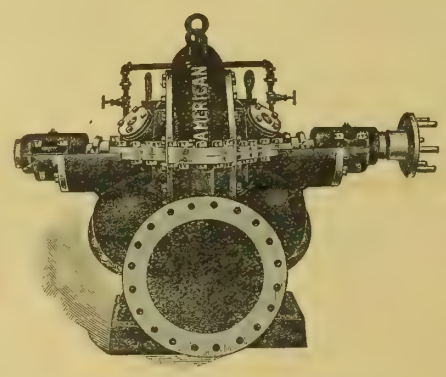
Because, recognizing this, the Patterson Co. employed the BEST ENGINEERS in the country to design the plants and select the pumps.

Because the Engineers knew that the first cost of the pumps was a small item compared with the cost of operation and maintenance, and that therefore GUARANTEED EFFICIENCY must be the determining feature in selecting the PUMPS to be used.

This was WHY AMERICAN PUMPS were selected for installation in the first FIVE STATIONS PUT IN 2 YEARS AGO.

BUT while the efficiency of a new pump can be tested at the factory, ONLY TIME CAN PROVE what the pump will do when working day in and day out. TWO YEARS SERVICE PROVED THEIR LASTING QUALITIES and ELEVEN MORE AMERICAN PUMPS are now being installed.

The Pump



AMERICAN PUMPS
are the ONLY Pumps in use in the PATTERSON COLONY IRRIGATING SYSTEM

"IRRIGATION BY PUMPING"
Containing description and pictures of this, the Model Pumping Plant of the West, will be sent on application to

SOLE AGENTS

What It Means to You

What is true for this pumping plant with pumps having a combined capacity of 200,000 GALLONS A MINUTE and costing over a QUARTER OF A MILLION DOLLARS is true for the smallest isolated irrigating plant in the country.

GUARANTEED EFFICIENCY AND LASTING QUALITY are what count.

You may not feel that the size of your plant justifies the expense of an expert engineer and exhaustive tests. Then PROFIT BY THE EXPERIENCE and expense of the Patterson Company and do as they did—

BUY AN AMERICAN PUMP, even if it costs a little more.

They did so two years ago, and after TWO YEARS SERVICE they have done so again.

BUY AN AMERICAN.

THE MUSIC OF THE TREES.

The world is filled with music
To ears atuned aright,
And a soul in perfect harmony
Is a soul all full of light;
But of true earthborn music
That's thrown upon the breeze,
Few have such gentle beauty
As the music of the trees.

They all have different voices,
And, were their language known,
A beauty all undreamed would swell
In every varied tone.
Their harps are swept by viewless wings,
Alike at eve or morn,
As to the tranced and listening ear
Their melodies are borne.

From boyhood's happy hour
To manhood's world of care,
Thro' joy, or calm, or suffering,
Their music met my ear.
The maple sang in gladness,
While the aspen danced in glee,
But the music of the mournful pine
Was ever sweet to me.

When first I knew its swelling notes,
'Twas as a blithesome boy;
I loved to climb its sturdy trunk,
And in its arms to lie.
Full many a castle there I built
(They are all tumbled now),
And pleasant was the music then
It breathed across my brow.

I made my Pine an errant knight
Or troubadour of old,
And the Maple was his lady love,
Dearer than gems or gold.
He brushed his leaves and spoke to her
Across my waving hair,
And her gentle voice would rustle back
Sweet answer to his prayer.

But manhood came, and 'mid its cares
Sweet voices gladness brought;
My children in the old Pine played,
Its topmost branches sought,
Or 'neath its sturdy, spreading arms
They shouted in their glee,
While the Pine would roll its echo back
Like the distant moaning sea.

Its voice was full of gladness then;
Its tone is mournful now;
The Fire King swept across its form
And scathed its lofty brow.
The group that sought its welcome shade
Is now a broken ring—
No hope of other life it has
To meet their welcoming.

And ever still, in saddened tones,
It whispers in my ear:
"Tho' I am seared, my heart is sound,
And upward my career;
Be thou the same—for unto thee
A better lot is given;
My life is but for earth alone,
But thou canst enter Heaven."

Thus music is in every tree,
And each leaf has a tone,
And on the ear that listens
Its melody is thrown.
So whate'er may be the music
That is flung upon the breeze,
There are few that have the sweetness
Like the music of the trees.

ALONG THE PERILOUS WAY.

(Continued From Last Week.)

But now he was very lame and tired. His mouth was open wide, as he panted heavily. Bloody slavers ran from his lolling tongue, and his eyes were red rimmed and bleary. If they would only let him rest a little! But he was a wolf, and it was everybody's duty to seek his life. But because he was a wolf he had the wolfish heart that keeps on and on and knows not defeat till it is dead. Northward was the way; and because he could not stop, he loped onward; and though each lope was very short, still he was a wolf.

For a considerable distance he kept to the lane and secured temporary respite, but a delivery wagon blocked the way and forced him to the street. Before he had gone a quarter of a mile he was again pursued; and now he could not outstrip his pursuers. As he struggled painfully onward, a long, low building suddenly blocked the way, and a dozen curs were snapping around him, and, seeing a narrow door, he dashed into it, almost against a portly man in a white apron. The pursuers piled promiscuously about the door and fell to fighting, and he of the white apron slammed the door.

Shag limped into a long aisle, and his nose was filled with the most delicious fragrance he had ever encountered. All about him, row on row, was meat, red meat, and raw. He was in the city market. Cries and much confusion followed his appearance. Many customers, regardless of half filled orders or orders not begun, rushed pell mell from the building. The pangs of hunger that had temporarily been silenced by the fear, excitement and fierce wrath of battle now returned, and, reaching up, the starved brute seized a mouthful of tender chops. Gulp, gulp; he jerked his neck and swallowed the savory morsels in great pieces.

"Open dat door!" yelled a florid faced man in a white apron.

"No; keep it shut, and we'll catch him!" It was a vegetable dealer in the next stall speaking.

"You t'ink you keep dat greedy devil here? You t'ink he not eat your cabbage- My Got! Look! Von dollar wort' of chop he eat alretty! Open dat door!"

And the infuriated German hurled a bare beef bone at the marauder. It found his ribs with a hollow "bung," and the wolf growled his reply through a mouthful of meat. He was not afraid of these men, not he. They were not hunting him. But the irate meat vender made an attack with a terrible knife in one hand and a cleaver in the other, and Shag moved on, dragging a long string of sausage through the sawdust on the floor. Up and down the long aisle he limped, looking for a means of exit. Presently he saw an open side door, and he fled through it.

Once again the stern chase began, with more dodging of the miscellaneous traffic of the city street. In spite of his feast, he felt more tired. Had he been a wild wolf, he could have run interminably; but on account of his confinement his muscles were not so wiry nor his wind so inexhaustible as they would otherwise have been. Rest, rest, was nature's insistent cry within his tormented body. But he was a wolf, and his wolfish heart drove him forward. Instinct told him that he must soon be through the maze of men and their habitations, and he sought the open country as the drowning victim seeks the air. He was going toward the land of freedom. On, on!

Elton street was largely warehouse property, and here Shag had a run without much molestation. Soon he reached the railway yard. Long lines of freight cars stood on the sidings, and under and among them he threaded his way. A yard engine was clanging near, but the wolf did not turn aside, for now he was calloused to fear. He paused, and looked backward with eyes that saw little, and then he lay down below a box car.

Many hours he lay and rested, and longed for the darkness. Several yard men passed dangerously close, but he crouched low in the shadows and es-

Christmas Gifts the McStay Way

We've got a Christmas present for you that will please you and be of greater value to you than anything else you will get this year.

We will give you this gift ABSOLUTELY FREE but before we tell you about it there is something else you will be interested in.

Do you know that the best and cheapest way to get the best things to eat and wear is the McSTAY WAY? You'd be surprised to know how many satisfied customers buy ALL their goods from McStay.

We buy and manufacture goods in tremendous quantities, and because of the big business we have we can afford to sell these goods at prices way below your dealer's.

Buying Christmas articles or anything else the McStay Way means SAVING DOLLARS. Look up the last issue of this magazine and note the low prices McStay quotes. You will be surprised at the high-grade goods we send you at ¼ to ½ the prices your local dealer charges.

Send QUICK for our big catalogue No. 41C, filled with genuine bargains in high-grade goods of all kinds.

Now as to that Christmas Gift: You can in a few hours get your friends to go in with you and order $40 worth of necessary goods from us. They will have to buy their Christmas goods some place, and you can show them how to SAVE MONEY buying the McStay Way. Take our Catalogue No. 41c and get them to go in with you and order only $40 worth of goods, and we will give you FREE a $1,000 Travel Accident Insurance Policy, paid up for one year, in the Pacific Coast Casualty Company, together with a genuine Sealskin Purse. You are liable to have an accident most any time, and think how fine it would be to get money all the time you were laid up. Send us the order as soon as you can and we will send you the Policy, all paid up.

caped observation. Toward evening that clanging, black, ill smelling monster again passed his way; and a few moments later there was a tremendous shock at the end of the line of cars. A wave of bumps and bangs seemed sweeping his way, and, filled with fear at the commotion, he attempted to get out. It required the third effort to get his stiffened, painful legs below him, and he crawled out just as the long line of cars started backward. Just then he heard the excited shouting of men near him, so he crawled under an adjoining line of standing cars. But every man here, as elsewhere, was a foe; and soon pieces of coal and stone came whistling his way. He was forced to strike out again on another march on his perilous way.

He was rested somewhat, and, thanks to the German's chops, he felt stronger, but every muscle was painfully sore and tortured him with each step. There were many cuts and bruises, too, on his gaunt body; for collies and curs bite hard. Still, he was a wolf, and the north called him. By the time he had crossed the tracks he had limbered up a little. He crossed the next avenue, went through a vacant lot, scared many bow-wows from a terrified St. Bernard pup, and took to the lane leading him in the right direction, toward the great wild.

Soon he was out in the street again. Ahead, even with his half seeing eyes, he could see the houses thinning out. Beyond was a stretch of prairie, and there, away on the horizon, was a dark line of timber. A fierce joy filled him, and he began to lope again. Three or four dogs were around him, but they lacked courage to touch him. Again he quickened his pace. Freedom and the land that he had yearned for for years were almost within his grasp. He would yet reach the land that called to him. Soon he would slip down along the bank of the river to the right and take shelter among the willows till darkness would hide him.

Suddenly a great greyhound shot alongside of him; then another on the opposite side. They arched their lithe necks as they ran, and rather dubiously prepared to grapple. Behind him Shag heard the quick thudding of a fast horse's feet, and shouts of encouragement from the driver. Ted Pentland, one of the city sports, was out for a run with his hounds. Big, shaggy staghounds they were, the best that breeding and money could obtain. They had scars of many a dying coyote's teeth upon their bodies; and now their proud owner saw fresh laurels within his reach in the killing of this gaunt, pain racked cripple of a gray wolf.

"Take hold of him, Bobs! Hi! S-s-s-sick!"

And they took hold, one before and one behind, as they had done with many a coyote. Shag went down before the onslaught; but he rolled over, and, in spite of his assailants, came up again. Victor had a cruel hold behind, and was worrying and tearing; but the other hound could not get a hold, for, with that lightning neck work which characterizes the chops of a wolf, Shag bit and cut and tore with his terrible jaws. With a six inch rent in his shoulder and a deep, ragged tear in his neck, Bobs gave a howl of anguish and quit, to lie and gasp and cough bloody froth. Then the wolf doubled backward, and with another chop fastened upon his rear antagonist. This time he did not let go, for now he knew that his only strength was in his jaws.

The frantic Pentland was now out of his rig and using his whip unmercifully on both dog and wolf in a wild attempt to separate them; but the two combatants, with scarcely a sound, other than their sickening, feeble worrying, rolled and guzzled.

Suddenly the hound lurched over, and with a gurgling gasp relaxed his hold on the thigh of the wolf. The latter had bitten him through the neck and killed him. The great, fierce brute lay on his victim and bit him again; then, in response to the lashings he was receiving, he propped himself up feebly on two legs and growled. Pentland immediately made a rush and scrambled into his buggy. Seeing the knot of onlookers gathering, he called for a gun. Someone instantly volunteered one, and they drove off to get it. The destruction of two fine hounds called for vengeance.

Shag rose from his victim, and, standing unsteadily on his two and a half sound legs, gazed with bloody eyes upon the half dozen onlookers across the road. His gray, disheveled coat was very red, and the blood trickled steadily down his useless hind leg from the terrible wound in his thigh; but still he was a wolf, there was life still in him, and the north called him. He hobbled limply toward the river, rolled and fell down the steep bank, and a hundred yards farther on reached the spreading willow thickets. On and on he hurried, limping, stumbling and staggering, stopping only once to quench his terrible thirst. Dodging from one thicket to another, he made half a mile by darkness. Then, because he could go no farther, he stopped, and fell down to lick his stiffening wounds. Any other creature would have laid down to die, or, indeed, have yielded to death's call long before; but because he was a wolf, and yet had life in him, he refused to die.

That night he crawled another mile; and all the following day he lay in hiding and gazed wistfully across the prairie at the long line on the horizon to the northward. Next night he crept into a farm yard and feasted on several sucking pigs; and before morning he somehow crossed that five mile stretch of prairie and entered the northern woods.

He had reached the goal of his weary life. He would see again his

New Land Opening

Under the

Kuhn California Project in the Sacramento Valley

The canal, drainage and road construction has been completed on the Delevan and Maxwell Units and these lands are now being sold in 10, 20 and 40-acre subdivisions.

The soil is a deep alluvial silt loam and is some of the best in the valley. The main line of the Southern Pacific Railroad passes through the land. Four trains daily each way North and South.

Towns, Schools and Churches Near at Hand

CROPS—All kinds of fruits, including oranges, lemons, cereals, seed, alfalfa, cattle, hogs and chickens.
WATER SUPPLY—Practically unlimited. Cost to the irrigator very low. Canal and drainage system the very best. Water delivered to boundary of every 40-acre tract.
TRANSPORTATION—Both by rail and river to the great metropolitan centers.
LAND PRICES—Low and terms of payment easy.

If you want to secure a home in California's Famous Valley, where climate, soil and water are combined to work for you overtime, cut out the attached coupon and mail to us for full particulars.

ome, the land of the pines and
pruces. It lay many miles yet, away
o the north; but there was shelter
ll the way, and he knew that he
ould reach it. The voices from the
orthern wilderness, singing of ever-
reens, whispering of aspens, the call
f the moose, and all the other wood
ounds—they that had spoken to him
o far away—would now whisper in
is ear. The joy in his heart was
reat, and it was well merited; for
hrough the camp of his enemies, one
undred thousand strong, he had run
he gauntlet of danger and suffering,
nd reached the end of his journey
long the perilous way.—Farm Prog-
ess.

HOT BREADS FOR COLD MORNINGS.

With the coming of the cool morn-
ngs of winter one naturally begins
o think of tempting, quick, warm
reads for breakfast. There are in-
umerable breads of this kind that
an be easily and economically made
nd they do much towards making the
rst meal of the day a nutritious as
ell as a satisfying one. In the mak-
ng of these breads the coarser flours
uch as graham, whole wheat, corn-
eal and cold rice and hominy, play
n important part. The following are
number of easily made and thor-
ughly tested recipes that will be ap-
reciated by housewives who are striv-
ng to keep their tables seasonable.

raham Muffins.

Rub to a cream a tablespoon of
ugar and two of butter. Into this
eat four eggs, sift a teaspoon of bak-
g powder into three cups of graham
our, add the butter and egg mixture,
nd beat very hard for three minutes.
urn into heated and greased muffin
ns and bake in a very hot oven.

ice Muffins.

Make a batter of a quart of milk,
ree beaten eggs, a tablespoon of
elted butter, a teaspoon each of salt
nd sugar, and two cups of sifted
our. Mix thoroughly, then beat in a
p of cold rice. Beat very hard for
ve minutes and bake in a quick oven.

atmeal Muffins.

To one cup of oatmeal mush add
e-half cup of milk, one well-beaten
g, one teaspoon of butter, one table-
oon of sugar and one cup of sifted
our in which has been sifted two tea-
oons of baking powder. Stir well
gether, beating at least three min-
es, and bake in hot muffin pans.

uick Biscuits.

One quart flour, one and one-half
p milk, one and one-half cup water,
e tablespoon mixed butter and lard,
e heaping teaspoon baking powder,
lf a teaspoon salt. Sift the salt with
e flour, mix in the butter and lard,
d the baking powder and the milk
d water, and mix to a soft dough.
ndle as little as possible. Roll out
sheets an inch thick, cut into rounds
d bake in a well-floured pan.

aham Biscuits.

Sift together in a chopping bowl a
t of graham flour and half a pint
white flour. To this add a teaspoon
salt, one of sugar and two well
nded spoons of baking powder. Mix
roughly and chop into the mixture
tablespoons of lard. Add a pint
milk, and if the mixture is then too
f to handle, add enough water to
ke into a soft dough. Turn upon a
red board, roll out and cut into bis-
ts, handling as little and as lightly
possible. Bake in a steady oven.

ham Gems.

nto a pint of warm milk whip three
eaten eggs, one tablespoon of
melted butter and a teaspoon of sugar. Gradually stir in a cup and a half of graham flour and beat hard for several minutes. Turn into heated gem pans, and bake in a very hot oven. Serve immediately.

Quick Waffles.

Two cups of flour sifted twice with one teaspoon of baking powder and the same of salt. Three eggs, one tablespoon of butter, two cups of milk. Beat the yolks smooth, add the milk, and turn this in upon the flour. Whip lightly and quickly for one minute, add the stiffened whites and drop by spoons into heated and well greased waffle irons.

Quick Buckwheat Cakes.

Two cups of buckwheat and half a cup of cornmeal; two cups of warm milk and half a cup of warm water, two tablespoons of molasses, two teaspoons of baking powder, one even teaspoon of salt. Mix milk, water and molasses together. Sift meal and flour three times with the baking powder and salt. Make a hole in the center of the flour, stir in the milk and water quickly and lightly until you have a good batter, not too stiff—and bake.

Corn Bread.

Two cups of cornmeal, one cup of flour, two and a half cups of milk, three eggs, a tablespoon each of butter and white sugar, one teaspoon of salt, two teaspoons of baking powder. Melt the butter and stir it into the eggs, which should have been beaten very light, and after sifting the salt, sugar and baking powder with the meal and flour, put in the milk, eggs and butter. Beat hard and bake for half an hour in a greased pan in a steady oven.—Farm Review.

GOOD THINGS TO REMEMBER.

To be loved, you must be lovable.

Never lose confidence in yourself.

Study yourself, know yourself, and learn to govern yourself.

Country boys usually make the most successful city men.

It is easier to learn to use tobacco than it is to quit using it.

Most people fail because they have not fitted themselves for the opportunities which come.

When you discover in others a quality which is distasteful to you, be careful you do not do those things which are distasteful to others.

The boy who has the best opportunities and the most natural ability does not always prove the most successful man. Determination to make the most of yourself is the greatest factor in success.—Selected.

TO YOUNG MEN.

Be firm! One constant element in luck
Is genuine, solid, old Teutonic pluck.
See yon tall shaft. It felt the earthquake's thrill,
Clung to its base, and greets the sunrise still.

Stick to your aim. The mongrel's hold will slip,
But only crowbars loose the bulldog's grip.
Small as he looks, the jaw that never yields
Drags down the bellowing monarch of the fields.

Yet in opinions look not always back.
The wake is nothing—mind the coming track.
Leave what you've done for what you have to do.
Don't be "consistent," but be simply true.

—Oliver Wendell Holmes.

Or sense or spirit? Who shall say
What touch the chord of memory thrills?
It passed, and left the August day
Ablaze on lonely hills.

—Whittier.

San Francisco Market

SAN FRANCISCO, Dec. 12, 1911.

Butter.

Butter advanced materially after last quotations, then declined till Monday, when extras dropped to within a cent of prices of a week ago. Market firm at this writing.

Prices to trade 2½c in advance of the following Produce Exchange quotations:

California Extras, lb	32
Prime Firsts	28½
Firsts	27
Seconds	26
Storage Extra	28

Cheese.

California Flats	14@17
Cal. Young America, fy, new	15½@17
Oregon, fancy	15½

Eggs and Poultry.

Eggs took the toboggan during all of last week, recovered slightly on Monday, but extras still stand six points under our last quotations. It is probable former high prices will not obtain again this season.

Citrus Fruit Market

LOS ANGELES, Dec. 13, 1911.

Five-sixths of the output of Butte and Tulare Counties has gone to market, and all shipments have brought remarkably good prices. Extra fancy stock has readily commanded $2.2[illegible] while good to choice brought not far from $2.00 f. o. b. California points. Southern California Navels are going forward more freely, and will continue to increase from now on. Excepting in one or two northern sections, sizes have been very satisfactory.

Lemons are low, perhaps no lower than other years, but rather lower than anticipated at this time. Fine stock is commanding $2.50, other grades running as low as $2.00 f. o. b. The quality is of the best, and those kept until later in the season will probably command better prices.

Shipments.

Shipments of Southern California citrus fruits to date since Nov. 1, 1911: Oranges, 488 cars; lemons, 595; total, 1,083. To same date last season: Oranges, 1,676; lemons, 561; total, 2,237. Tulare County: 2,466 cars of oranges, 64 of lemons; total, 2,530. Butte and Sacramento, 300 cars of oranges.

NEW YORK, Dec. 11.—Ten cars Navels, one car Airzona Navels, seven cars California lemons sold. Market strong on Navels, firm on good stock lemons. Weather fair and warm.

THE AUTOMOBILE AND THE FARMER.

If there is any class of people on earth that can make profitable use of the automobile and auto truck it is the farmers. Many farmers are buying automobiles not only for pleasure but for business. We were standing on the street the other day when a dairy farmer drove up to the curbing with an automobile. He lives nine miles in the country, and it takes him but thirty minutes or less to come to town. In his remarks to us he in substance said: "I find the automobile a profitable investment in my business. If a machine breaks down or material for running the farm is needed quickly, I find the automobile a most convenient way of obtaining it. Not only does it serve me in a business way, but I find it possible to attend evening entertainments in town with my family which I could not when I had to depend upon horses."

The auto trucks are also coming into use for hauling farm produce to market. The canning factory at Ft. Atkinson, Wis., this year hired an auto tractor to haul shelled peas from the vining plants to their cannery and found it did the work cheaper than teams and more satisfactorily. It could work eighteen hours a day in hot weather and no one felt concerned about its condition. The lighter trucks are coming in use for delivering milk and cream.

We are living in the age of gasoline and horseless wagons and carriages, and no one can say how far they will go in replacing the horse upon the farm, but it is certain that many a farmer will find that the automobile, auto truck and auto tractor is a great aid in his work.—Hoard's Dairyman.

California Cultivator
Clubbing Price List

For Season 1911-1912

This magazine price list is prepared annually for the convenience and benefit of Cultivator subscribers. The prices given allow our readers the benefit of the lowest figures possible, in return for which, all we require is that to all orders a year's subscription to The Cultivator (class 18) be added at 90c (regular price $1.00 per year).

Find on this sheet a very complete list of the most popular magazines. We can, however, supply any periodical published. The lowest price on any not listed here will be quoted on request. Let us make you a price on any combination you may desire.

Periodicals in any combination may be ordered to the same or different addresses. Foreign or Canadian subscriptions are extra on account of added postage, and prices must be gotten by correspondence. Subscriptions may be either "new" or "renewals (except where otherwise stated in the list), but it is important that this information be given in each case.

Books—Send us a postal for our list of agricultural books which we supply subscribers and which we recommend as most suited to California conditions.

The pricing of various combinations of magazines is a simple matter; all are listed according to class number and this class number multiplied by 5 gives the cost price.

RAIN

A glorious rain has drenched the southland, making prospects excellent for a banner year.

Before long we will be swamped with orders for nursery stock of every description. There is already an unprecedented demand for fruit trees, so it will pay you to

Place Your Orders Now

We have a magnificent stock on hand and are prepared to fill your orders for any quantity.

TREES

Every Variety

Fruit and Ornamental
Plants and Vines
Shrubbery
Palms
Roses
Etc.

We are authorized propagators and distributors of Luther Burbank's fruit introductions. Our stock of the 1911-12 novelties is limited and we urge your immediate reservation of trees for this season's planting. Among the new novelties offered for the first time this season are the "Goldridge" Apple, "Abundance" Cherry, "Leader" Peach, "National" Peach and the "Conquest" new stoneless Prune. We will be glad to tell you further particulars and prices.

Burbanks NEW CREATIONS

Calimyrna FIGS

This is the **Genuine** SMYRNA FIG—the world famous fig of commerce—introduced by us and grown successfully. It is undoubtedly the only fig to plant for shipping, table and drying. Large, delicious and nutty flavor. Superior in all respects and bound to supercede every other sort. We also have the Adriatic types—MISSION, BROWN TURKEY and WHITE ENDICH.

Let us know what your probable requirements will be (no matter how large or small) in nursery stock for this season's planting. Our immense nurseries and our 28 years' experience in business in this state insure our being able to fill your orders with best stock in A1 condition.

Every planter of trees should have our book—

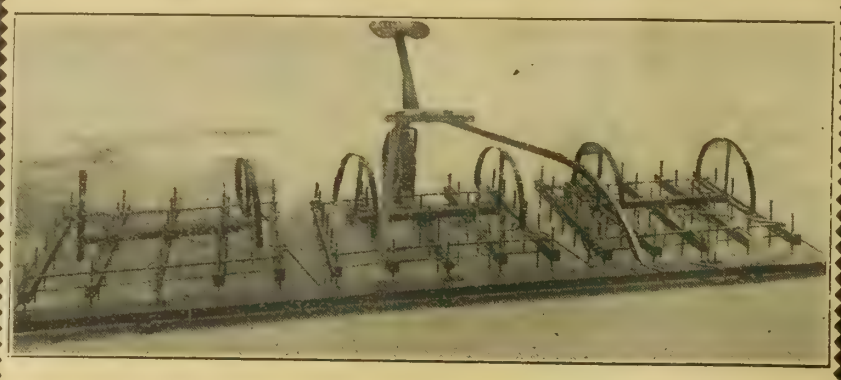
THIS MODERN HARROW

—WILL SAVE YOU—

TIME and MONEY



Three section (90 teeth) six-horse harrow

—PATENTED—

Points of Superiority

It is automatic. It is self cleaning. Can be ridden. Saves strength and labor. Can be operated by a twelve-year-old boy. To clean press the foot pedal. Frame made of seasoned oak.

PRICES

One section, without cleaning attachment or cart	$10.00
Two sections, without cleaning attachment or cart	19.00
Three sections, without cleaning attachment or cart	27.00
Four sections, without cleaning attachment or cart	36.00
Cleaning attachment, per section	4.50
Riding cart for one, two, three or four sections	10.50
Frame, without teeth, per section	8.50
Draw bar for two sections, $2.00; three or four sections	2.50

You can purchase the self cleaning attachment and put it on your old harrow. Riding cart may be purchased separately.

Would you like to know more about this new harrow, which will lighten farm work and at the same time do it more effectively? We guarantee this harrow to be the most satisfactory and economical on the market. You can do more work and better work with it than with any harrow you ever used.

Send in your order at once or write for further information.

Bean Power Sprayers

HAVE MANY EXCLUSIVE ADVANTAGES

The Underneath Suction avoids priming, increases capacity, and saves replacing cracked suction hose.

The Direct Machine-cut Gear Connection is much to be preferred to belt or lever.

All Bean Power Outfits are made with steel frame, instead of wood, and all have porcelain-lined cylinders.

Bean Bell Metal Ball Valves seldom ever clog and all the wear comes on the seat, which cannot only be replaced at small cost, but is machined on both sides, giving double wear.

The Bean Pressure Regular cuts from one-fourth to one-third off the gasoline bill—and saves the same proportion of wear and tear on engine and pump.

California Olive Crop of Increasing Importance

By Dr. J. Eliot Coit

The California olive tree has at last lived down a bad reputation which was saddled upon it in the early days in a manner both unjust and unfortunate. Some one who had evidently "been to Europe" freely circulated the advice that the olive should be planted on soils and in situations where other trees could not be grown with profit. As a result of this, many of the early plantings were placed in washes, on stony hillsides or along drives, and no attempt made to water and care for the trees. Of course such trees remained barren and the sight of them for years has impressed on many the erroneous idea that olives are a bad investment.

Those growers, however, who planted their olives on good land and gave them proper care have been rewarded with bountiful crops. A few years ago California olive oil had to compete in the markets with cheap cotton seed oil labeled as olive oil. This was disastrous. But thanks to our national and state pure food laws this outrage has been abated, and as a result the olive industry throughout California is taking on new life. At the present time it is difficult to buy olive nursery stock in large amounts on account of the fact that recent heavy plantings have absorbed the supply. The extension of the ripe pickle market is also partly responsible for this marked stimulation of interest in olive growing. The American pickle market is capable of almost indefinite expansion if the general eastern public can only be educated up to an appreciation of the great superiority of ripe olives as a food over green olives as a condiment.

Olive Orchard, La Mirada.

Soil and Location.

The olive tree is not particular as to the character of soil so long as the quality is good. It requires a deep, fertile, well-drained soil and will bear satisfactory crops whether such a soil is sand, loam, disintegrated granite, or medium adobe. The climatic requirements are similar to those of the orange, for while the tree will stand much more cold than the orange the fruit of most varieties will be ruined by a temperature of 23 degrees F for four hours. Foothill lands for which there is not sufficient water for citrus fruits but enough for olives are very satisfactory.

Olives are especially adapted to the more arid portions of California, such as the great inland valleys of the San Joaquin and the Sacramento, and Imperial Valley. In the hottest of these valleys the trees are free from their most serious pest, the black scale, which is such a nuisance near the coast. The great Imperial Valley with its very fertile soil and cheap water presents an exceptionally inviting field for olive culture.

Propagation and Planting.

Olive varieties are propagated by layering, by grafting or budding upon seedling stocks, or by rooting cuttings; the latter method being by far the most common. The Mission roots readily from tip cuttings under shelter or large stick cuttings in the field. Certain varieties, however, such as the Uvaria, will not root from cuttings and are propagated by budding onto the Mission, Chemlali, or other variety which roots readily. Well grown cuttings should be large enough for field planting after one year's growth in the nursery, but two-year-old trees are usually better.

When olive trees are dug from the rows they must be headed back severely, the branches being cut to six inches. The roots should be carefully protected by damp wrappings and should never under any circumstances be allowed to dry out. The actual setting of the tree differs little from that of any other fruit tree except that it is advisable to plant two or three inches deeper than the tree grew in the nursery. January and February are the best months for planting and twenty-four by thirty feet is a desirable distance to set an orchard of Mission olives. This will require sixty trees to the acre. Manzanillo olives may be set as close as 20x20 feet provided they are kept well pruned.

Cultivation and Irrigation.

Like other tree fruits, olives will respond in proportion to the care they receive. A winter leguminous cover crop plowed under in spring and thorough cultivation throughout the summer will certainly pay whether the orchard is irrigated or not. Along the coast and especially in Ventura and Santa Barbara Counties, there is usually sufficient rain to produce satisfactory crops, although it is a question whether some irrigation would not pay even there. In the interior valleys irrigation is necessary for the production of fruit, although the trees will remain alive should the water fail for several years. The olive does not require as much water as citrus trees; one miner's inch continuous flow for eight acres, provided the soil is fairly retentive, is considered sufficient on desert lands. It is better to give the ground two or three deep soakings during the dry season followed up each time by thorough cultivation than to depend on frequent shallow irrigations with indifferent cultivation. It is very important that the soil should be quite moist during the blossoming period if a heavy setting of fruit is to be expected.

A well-cared-for orchard may be expected to produce some fruit the fourth year and by the fifth year it should be paying expenses. The trees come into full bearing at ten years old and continue to produce from two to five tons per acre as long as they are properly cared for, or for fifty years, at least,—perhaps for much longer. It is said that there are profitable olive orchards in Italy which are more than one hundred years old.

Pruning and Topworking.

Young olive trees should be headed back while in the nursery rows, the largest branches being cut back to six inches in length. In this condition they are transported and planted out in orchard form, no further pruning being done during the first year. It is very important to refrain from pruning or suckering during the first season's growth as the proper development of the new root system depends upon the early growth of a large number of leaves. The shaping of the tree should be begun during the dormant period at the end of the first season's growth. At this time all suckers are removed, wayward branches cut back, and the top headed at about three or four feet from the ground. The single trunk tree has been found more satisfactory than the multiple trunk, shrub-like tree of early day plantings. The second winter all but one upward shoot on each of the framework branches should be cut away. During the third and fourth winters this shortening in should be continued with the idea of checking too rapid an increase in the size of the tree and causing the main branches to grow short, stocky and strong instead of long, bendable and breakable.

In all subsequent pruning it should be borne in mind that the olive bears on wood of the previous year's growth. By light annual pruning new twig formation should be encouraged throughout the body of the tree and along the larger limbs, but such growth should be kept thinned out and not allowed to become too dense and brush-like, as too much shade hinders fruit production. Olive trees should be kept sufficiently low for all the fruit to be gathered from a stepladder. To do this will mean the occasional cutting back of the too ambitious upper branches, which if left alone will soon produce the bulk of the crop at an altitude too great for economical harvesting.

Old orchards of unprofitable varieties may be top-worked to more desirable varieties. This is done by cutting off the large limbs and twig-budding the second year into the young vigorous shoots which arise. Budding should be done in spring just after growth has started. It is wise to avoid giving an old tree too great a shock by top-working it all at one time. One-half of the branches may be budded one year and the other half the following year.

Varieties.

When olives first began to be grown commercially in California a very large number of European varieties were introduced and tested. Only a few proved of value under California conditions, some of which are as follows:

The Manzanillo—A Spanish olive which ripens very early and is of value chiefly for pickles, the oil being undesirable on account of the fact that it solidifies at comparatively high temperatures.

The Sevillano or Queen is a very large olive, suitable for green pickles.

Correggiola, Nevadillo, Pendulina, are good oil olives.

The Columbella is an oil olive which is used chiefly for mixing with other varieties to make the oil lighter in color.

By far the best all-purpose variety, however, for California is the Mission which originated as a seedling at the San Diego Mission. This variety is equally suitable for oil or pickles. The fruit ripens from December 1st to April, the color being jet black when ripe. The tree is quite large in stature, a thrifty grower, and most prolific bearer. About the only objection to it is its habit of ripening the fruits gradually. Often all stages of olives from dead ripe to perfectly green may be found on the same twig at the same time. On this account it is necessary to pick over the trees several times. It appears also that in certain localities the Mission does not set fruit well unless planted with other varieties for the sake of cross-pollination.

There is usually more net profit in making pickles than oil, hence it is good business policy to operate a pickling plant in connection with each oil mill. The olives are graded according to size, the perfect fruits of the largest sizes being made into pickles. Perhaps a good selection of varieties for an olive ranch would be somewhat as follows: 60 per cent Mission, 20 per cent Manzanillo, 10 per cent Pendulina and 10 per cent Columbella.

The Manzanillos will enable the pickling plant to begin operations early in the fall. The Missions will constitute the bulk of the crop. The other two varieties would be planted in occasional rows among the Mission for the sake of cross-pollination and the fruit mixed in with the oil olives for the purpose of securing a better color of the oil.

Citrus and Tropical Fruits

PROPAGATING THE OLIVE.

By J. W. Mills.

It has been told in the columns of the Cultivator how in foreign countries the olive is sometimes propagated by burying large limbs a few inches below the surface of the ground and with due care removing the sprouts when they attain sufficient size. These sprouts send out roots below the surface of the soil, and as there is a continual succession of sprouts, a log of olive wood will continue to produce rooted slips for some time. The offshoots come from adventitious buds. These are dormant buds distributed promiscuously and irregularly beneath the outer bark. This process is only of passing interest to California growers, as it necessitates the cutting of large branches from desirable trees.

Hardwood cuttings about one foot in length are ordinarily used, taken in February or March and planted with an inch or two of the top exposed. It is the experience of some growers that a longer cutting, about eighteen inches, is better, as the hot days of midsummer tend to dry them out too fast if the lower ends of the cuttings are only ten inches or so beneath the surface. These cuttings should be half an inch or more in diameter.

The most rapid process of growing young olive trees is by the so-called herbaceous method. The hardened tips of the previous summer's growth are used. This means from one to three cuttings taken from each well grown twig. The trees from which these twigs are taken must have been well irrigated and cared for in order to make thrifty cuttings of the right texture. The cuttings should be about three inches long, with two leaves at the apex. This requires the removal of the two lower sets of leaves from the cuttings, as the well grown twig should have about three sets of leaves in the length of three inches. These cuttings should be about one-eighth of an inch in diameter. Experienced propagators tell us that it us useless to use sucker wood for this method, as it fails to make good. This is true of all kinds of suckers. The soft growth at the tips of the twigs that bend easily between the fingers should not be used.

These small cuttings are stuck in coarse sand in flats, about 700 cuttings in a flat, 2 feet by 18 inches. Usually they are placed in glass houses, in which artificial heat is applied, but there is often heavy loss from fungus, owing to the warm, moist atmosphere being an ideal condition for this disease.

One of the most successful growers in Southern California has rooted his olive trees by this method, excepting that he used cold frames with manure for bottom heat. This seems to be an improvement over the hot house method and is much cheaper. The plants must be kept continually moist, not even allowing the surface of the sand to become dry. After the young olive trees grow tops a few inches high they should be transplanted to the field nursery without exposing the roots to the air, and watered as soon as planted. Cuttings should be put in the flats now.

The above described method of growing olive trees was first practiced, as far we know, in Southern California by Kenneth McLennon, first superintendent of the Southern California Substation at Pomona. The idea was suggested to him by Dr. E. W. Hilgard, and immediately revolutionized the olive nursery business.

OROVILLE CITRUS AND OLIVE FAIR

With a most auspicious opening in which the Governor of California participated and even a quorum of the state assembly and the state senate present, Oroville opened its great exposition for 1911. In his address Governor Johnson remarked:

"It is a great honor, as well as a great treat, for us to be with you and to participate in the opening of this great exposition. Tonight all California is congratulating you people of Oroville, for here are found blended the romance of Old California with the progress of New California. Here we find the old romance hand in hand with that spirit that is now making California famous the world over. It is for these reasons that the Chief Executive of the State, and over a quorum of the Senate of the State of California, are here to wish you success as you start upon this exposition. All California rejoices in Oroville's spirit, its accomplishments, and in the prosperity that is your lot now and will be yours to even a greater extent in the future."

And indeed the entire state did take a lively interest in this exposition. Over a million oranges were shown, and in addition many exhibits of olives, apples, nuts, prunes, raisins, mining industry and a thousand and one others which could not help but impress every visitor with the diversity of the Sacramento Valley's productive resources. As to oranges it has been claimed that the Sacramento Valley and its foothills will send out approximately a thousand cars this year, and this fact more than the occasion for merry-makig is what led many to attend the exposition. Of course different days were devoted to different communities, counties or organizations, so that at times the attendance resulted in a crush, but ordinarily the exhibits were so placed that all could see exceptionally well. The principal feature in the center of the great tent was a fountain banked on each side with oranges, and near by was an American flag done in oranges with electric lights answering for stars.

Regarding the community exhibits The Oroville Register says:

Thermalito.

"The words Thermalito and oranges have become practically synonymous. In recognition of the fact that it is one of the most important orange producing sections of the state, the residents of that prosperous and beautiful suburb of Oroville have a magnificent display of their products at the Orange and Olive Exposition. In addition to individual displays, the Butte County Citrus Association has sent from its Thermalito packing house an entire carload of great, golden oranges for display. These oranges, in a great golden mass, surround the fountain in the center of the tent. Massed here and there throughout the building there are many other boxes of fruit. Setting off the oranges are olive boughs and clusters of enormous grapefruit. The display is an impressive one, and by its size illustrates the fact of the commercial importance of the orange industry in Thermalito."

Palermo.

"Palermo, the first place in the great state of California to place its oranges

Barker Bros

ESTABLISHED 1880
724-738 S. Broadway
Los Angeles
California

upon the eastern markets this year, is making an impressive showing at the Orange and Olive Exposition. To give a list of all the things that Palermo is growing would require the publication of a glossary on horticulture and agriculture. Palermo claims that it grows everything and if any one is from Missouri, it has the products right there to show them. Every form of citrus fruit is exhibited. There are olives without number. Every form of deciduous fruit is represented. There are immense vegetables of every kind. And added to this is an exhibit of magnificent Palermo grown tobacco, and also a display of locally grown cotton. In fact, the list of what Palermo is not growing would be a good deal shorter than the list of the various products on display there.

Palermo Colony, which is about twenty-five years old, produces each year in the neighborhood of 500 carloads of oranges and 1000 tons of olives. The fruit this year was first in the eastern market. W. P. Hammon, the largest single producer in the Northern California Thermal Belt, has large holdings there. During the past two years a tremendous interest has been shown in Palermo, and large numbers of homeseekers are now coming into the colony and establishing homes there.

"There are over 1200 acres in the Palermo Colony that are now planted to oranges and olives. There are yet 2000 acres in the colony that are available for cultivation. The land lies under Palermo Ditch, and the supply of water for irrigation is ample. Owing to the large influx of new settlers and the new groves that are being planted, it is certain that the product of Palermo in the next few years will be greatly increased."

Wyandotte.

The claims of the Wyandotte Section are being presented in a most forceful manner at the Orange and Olive Exposition, and it is certain that that section will reap a tremendous advantage from the showing that it is making. In the center of the booth is a model of the pretty Wyandotte school-house, the model being made of dried figs, dried peaches, and olives. Surrounding the model is a real lawn, banked with violets. At the top of the school, symbolic of the patriotism of the community, flies an American flag.

In addition to the orange and olive displays, there is also an extensive exhibit of dried fruits. Wyandotte has attained a state-wide reputation among fruit men for the quality of its peaches, and the tempting display of dried peaches there is evidence of the fact that its reputation is based upon the merit of its fruit.

The display of oranges and olives is most excellent and is proof positive of the adaptability of that fertile section for the culture of citrus fruits and olives, as well as of deciduous fruits. There are also exhibited lemons, limes, figs, nuts, grapefruit, vegetables of almost every kind, and all of a superior quality; also a number of jars of preserved fruit so tempting that it is hard to pass the booth.

Bangor.

The exhibit of the Los Verjeles company is a novel one and consists in part of a soil exhibit, in which branches of olives, laden with berries, have been placed. The whole gives the effect of an olive grove. Vegetables appear between the trees, telling the story far better than words. The display consists of oranges, olives, grapefruit, nuts, and vegetables.

Deciduous Fruit Culture

THE PEAR THRIPS IN CALIFORNIA.

Address By G. E. Merrill, Before the Fruit Growers Convention at Santa Rosa.

History.

In the spring of 1904 some of the orchardists of Santa Clara Valley noticed that the blossoms on their fruit trees did not open as they should. A closer inspection showed that the failure of the blossoms was due to the ravages of a minute insect, many specimens of which could be observed by shaking the infested twigs against the hand. This insect was later described by Miss Daniel of the University of California in Entomological News and was named by her the pear thrips (Euthrips pyri) as her specimens were taken from pear trees. Although our earliest authentic records of the insect date only from 1904, we have reliable reports from orchardists and others that the phenomena of the blasted buds had been observed in some sections of the valley several years prior to the date named. Just how long the pest has been present in California and how it came to be here are matters of conjecture. There are strong reasons for believing it to be a native species. On the other hand there are other reasons, probably equally strong, for the belief that it is an introduced pest. Personally, the writer is inclined to the opinion that the insect is a native form, the marvelous prosperity of which during the past few years can be accounted for by an abundant food supply, and other conditions favorable for its rapid development.

Distribution.

The pear thrips is at present generally distributed throughout the fruit growing districts of the Santa Clara Valley, the counties around the San Francisco bay region, and parts of Yolo, Sacramento, and San Joaquin Counties. The insect is spreading rapidly and it is probably only a question of time before it will become generally distributed throughout the deciduous orchards of Northern California. The pear thrips has also been found in England and in the state of New York, where it promises to become a serious pest of the pear tree.

Damage.

The damage done by the pear thrips is caused by its eating and egg laying ravages on the tender tissues of the expanding flower and leaf buds, and later by the attacks of the larvae, or "white thrips," on the young fruit. In badly infested orchards, the work of the pest is so quickly and thoroughly done, that the buds have no chance to open. At the time when the blossoms of these orchards should be at the height of their beauty, a brown, fire-swept appearance is presented, and not until the larvae have disappeared beneath the surface of the ground do the trees appear in their customary spring-time garb of green. Under these conditions practically no fruit is matured. In orchards less affected, much fruit persists on the tree, but does not come to a normal maturity. In the case of prunes and plums, a large percentage of the fruit will present a scabbed appearance when matured. With pears the fruit may be scabbed and curled, or otherwise badly deformed. Although the pear thrips attacks nearly all of the deciduous fruits, most of its damage is done to prunes, pears and cherries. There are but few cases on record of serious damage to peaches, apricots or almonds. The hairy surface of these last named fruits seems to protect them to a certain extent from the voracious appetites and injurious egg laying habits of the species.

The amount of damage done by the pear thrips during the past seven years has been conservatively estimated by agents of the U. S. Department of Agriculture at seven millions of dollars. In this estimate no account is taken of the cost of spraying operation and other means exercised for the control of this insect pest, probably the most serious one that today confronts the deciduous fruit grower of our state.

Life History.

Before any insect pest can be fought intelligently knowledge of its life history is of prime importance.

Early in the spring just when the buds are beginning to swell, the adult thrips make their first appearance on the twigs and buds. In the Santa Clara Valley, the thrips are usually first noticed about the middle of February. From the time of their first appearance, the number of adult thrips in evidence rapidly increases until late February or early March when a rapid decrease is noted. However, the latest thrips may not leave the ground until early April. As many as 400 individuals have been taken at one time from a single cluster bud of cherries or prunes. From 50 to 100 thrips per bud are frequently present throughout a badly infested orchard. By the time the scales on the buds have separated enough for the thrips to squeeze in, in they go, to feed on and otherwise to injure the tender tissue within.

Kipling's line "for the female of the species is more deadly than the male," is incontestably true of the pear thrips, for they are all "lady" bugs. No males have yet been found. Just as soon as an entrance is forced into the bud, the insect begins to feed. Now, thrips do not feed like cows, by biting off and chewing their food, instead, they rasp an opening through the skin of the leaf or blossom tissue, insert their beaks and partake of the life juices of the plant. After a few hearty meals, the thrips are ready to begin another branch of their life activity, that of egg-laying. To lay an egg, a thrips rasps a hole through the skin of the tender plant tissues with her saw-like ovipositor, which is then inserted in the opening as deeply as possible. An egg is then passed through the ovipositor and imbedded in the growing tissue. A great deal of the damage caused by thrips is due to the effects of ovipositing, especially in the case of cherries and other fruits with long, tender stems. A few thrips eggs placed in a cherry stem will so weaken it that the fruit is caused to drop. Thrips lay better than Petaluma chickens. From 25 to 50 eggs per thrips are laid during the active adult stage of three or four weeks' duration, a record of which any hen might well be proud.

The eggs themselves are small, bean-shaped objects, from which the young thrips, the so-called "white thrips," emerge in from four to fifteen days. Usually about eight days are required. The larvae feed on the blossoms, opening buds and young fruit in much the same way as the adults. They increase rapidly in size and at the end

of three weeks become full grown and fall to the ground. Here they penetrate the soft layers of soil and enter the compact sub-soil or plow pan, to the depth of three or four inches. The depth at which the larvae come to rest depends largely upon soil conditions. in loose sandy or gravelly soil, a depth of two or three feet is sometimes attained, but in heavier, more compact soils, the majority of the thrips are found within twelve to fourteen inches of the surface. As soon as the thrips have come to rest, they form a little cell about themselves and remain quiescent throughout the rest of their larval and pupal stages. Pupation takes place in September, and pupae are most abundant in the ground during October and November. Throughout the latter months, and in December, the pupae transform to adults, which gradually become more active, as the season advances, until they are ready to emerge at the first indications of spring. The number of adult thrips per square foot of soil varies, of course with the intensity of the infestation. As many as 4000 thrips per square foot have been taken from badly infested ground. From 200 to 500 thrips per square foot are enough to create a serious amount of injury.

* * *

CONTROL METHODS.

The control of the pear thrips was one of the most difficult problems ever presented to economic entomologists for solution. Ever since 1905 a large part of the time of from one to seven experts of the U. S. Department of Agriculture, besides the time of several other economic entomologists, has been devoted to a study of this pest, and the means of controlling it. As a result of the work of these investigators, have come two methods of control, or rather, spray formulas,—the government formula and the lime spray—both of which seem to give good results under certain conditions.

Soil Fumigants and Cultivation.

As the greater part of the thrips' life is passed in the ground, it was at first thought that the insect could be best attacked there. To this end, soil fumigants, fertilizers and the flooding of the ground for various periods was resorted to, with but little encouragement. Any fumigant that would kill the thrips was either too difficult of application or too expensive to be practical. The thrips seemed to thrive in water soaked ground and complete immersion for periods of six days or more had absolutely no effect on their subsequent activities. The results attending cultivation experiments were more pronounced and by thorough plowing and cross-plowing the number of thrips in the soil of some of the orchards in the Santa Clara Valley was reduced from 50 to 70 per cent. Plowing to be at all effective must be done when the thrips are in the pupal stage, as they are then very easily injured and the slightest disturbance will kill them. The plow must also be set deep enough to break up the first three or four inches of the hard soil or plow-pan. To do this in most orchards in the Santa Clara Valley, the furrows turned must be at least eight or ten inches in thickness. The difficulties attending this depth of plowing are obvious to any practical orchardist. After the land is plowed and cross-plowed, it must be well harrowed, in order thoroughly to break up and pulverize the clods and lumps. In soils where a large proportion of the thrips are found at a depth of 16 inches or more, the futility of this treatment is apparent. Even where more than half the thrips present are killed, enough survivors may be left to cause a total failure of the crop. Thorough cultivation can do no harm and in many cases the orchard will be benefited both from the direct effects of the cultivation and indirectly from the thrips killed. In badly infested orchards, however, plowing and cultivation can be relied on at best only as a supplement to a more efficient control of spraying.

Spraying.

In the early experiments of the department, a large number of different insecticidal sprays were tried out. All poison sprays were failures, because of the peculiar feeding methods of the thrips. Sticky sprays were difficult of application, and did not long retain their sticky character after application. Dust sprays failed to kill. Sprays, whose insecticidal properties depend on caustic soda, carbolic acid and other caustic materials, were a success in so far as killing the thrips went, but their use was inhibited because of their harmful effects on the blossoms, foliage and fruit. Distillate oil emulsions, when sufficiently strong, were effective in killing the thrips. They also injured the foliage. Early in the work the efficacy of various tobacco washes was noted, but the insecticidal powers of these washes were soon dissipated by evaporation, and at best they lack the quality of penetration, that is, to force them into the expanding buds was difficult. Finally came the idea of combining a weak distillate oil emulsion and a tobacco wash. From this idea was developed the government formula which is today giving good success applied in the right way under favorable conditions.

Government Formula.

The formula which has given the best results is made up of 3 per cent distillate oil emulsion, to which is added from 1 to 1 2-3 per cent tobacco extract No. 1 (Blackleaf containing 2.75 per cent nicotine) or tobacco extract No. 2 (sulphate of nicotine or Blackleaf 40) which is 40 per cent nicotine, at the rate of one part to from 1500 to 2000 parts of the spray mixture. The distillate oil emulsion may be obtained from several dealers in chemical and spraying supplies. or may be made at home. By the use of the home-made emulsion, a considerable proportion of the cost of spraying is saved, and what is more important, the quality of the emulsion is above reproach when good materials are properly used in its manufacture. The stock emulsion can be made several weeks previous to the time of spraying if necessary. The first step in the manufacture of the emulsion is the making of the soap according to the following formula, which will give, when properly mixed, about 40 pounds of fairly firm soap:

Water	6 gallons
Lye, 98 per cent	2 pounds
Fish oil	1½ gallons

To make the soap: Place the water in the kettle or cauldron, and add the lye. When the lye has been dissolved and the water is boiling hot, add the fish oil. Boil the mixture gently for one and one-half or two hours, or until it presents a ropy, stringy effect when allowed to drip from the ladle. One of the secrets of success in the making of this soap is the use of the genuine fish or whale oil. A mixture of fish and vegetable oil will not do. This fact should be impressed on the mind of the dealer from whom the oil is purchased, so that no attempt at substitution will be made. With oil

A poultry show is to be held at Astoria, Oregon, next week.

Okanogan, Washington, has a new cooperative creamery.

at 35 cents per gallon the cost of the soap should be about one and two-thirds cents per pound.

To make the distillate oil stock emulsion, the following formula, or some multiple thereof is used:

Hot water	12 gallons
Fish or whale oil soap	30 pounds
Distillate oil	20 gallons

No one should attempt to make this emulsion without the use of a power sprayer with a good agitator. For a 200-gallon tank, five times the amount of ingredients named above are necessary, if a full 200 gallons of stock is to be made. The water should be boiling hot when put into the tank. As soon as the water is in, the agitator must be started and the soap immediately added. Just as soon as the soap is dissolved, the oil must be slowly added, in the meantime keeping the agitator at work. After the oil is well mixed with the soap and water, the contents of the tank should be passed through the nozzles at a good pressure (175 to 200 lbs.) into storage tanks or barrels. The passage through the nozzles is very essential for the securing of a good emulsion. Other essential points are, reasonably exact measurements, boiling heat for the water, and the right kind of distillate. In fact, good results in the orchard depend absolutely on the quality of the distillate. The oil should test 32 to 34 per cent (Beaume) and should be the raw, untreated distillate, comparatively free from naptha and with a high flash point. Indeed, the best results are derived from the use of a raw, short-cut distillate, that is, a distillate from which the lighter hydro-carbons, gasoline, naptha, etc., have been removed. Oils of this character are put out particularly by some of the Bakersfield and Coalinga oil companies.

Where the water is unusually hard, the use of caustic soda or more soap than the formula calls for may be necessary in order to soften it.

The stock emulsion made according to the foregoing formula contains about 55 per cent of oil, and should cost the maker about 5 cents per gallon. To make a 3 per cent emulsion for use in the orchard, about 5½ gallons of stock solution should be used for each 100-gallon tank. The stock emulsion should be first placed in the tank, and the water should be added under constant agitation. The tobacco extract should be the last ingredient added to the mixture. Owing probably to different climatic conditions, the use of a larger amount of tobacco extract is necessary in the interior valleys than in the Santa Clara Valley. In the interior valleys, Extract No. 1 should be used at the rate of one part to sixty. No. 2 is used at the rate of one part to 1500, or a little more than a pint of extract to a 200 gallon tank full of spray mixture. In the Santa Clara Valley, good results are secured by the use of smaller amounts. No. 1 may be diluted 1 to 75, and No. 2 1 to 2000.

Treatment Advocated.

Where the orchards are badly infested but three applications are necessary except in the case of pear orchards, where more may be advisable. The first two treatments are for the adults, the second for the larvae. The first application should be made just as the thrips begin to enter the separating buds. In this treatment, as in all others, a rather coarse, driving spray should be used, at a pressure of not less than 175 pounds to the square inch. Particular pains should be taken to shoot the spray into the expanding buds. To do this the nozzle must be held rather closer than usual to the twigs and buds. Except with very small trees, a tower on the spray outfit and a third lead of hose are absolutely necessary.

The second application should be made from four to ten days later when the tips of the petals begin to appear. This treatment should be made in the same thorough manner as the first. The third treatment for the larvae should be made after the petals have fallen and particular pains should be taken to reach the under side of the young leaves before the upper sides are touched. If the upper side is hit first by the spray, the larger part of the larvae will be knocked to the ground without coming in contact with the spray. A somewhat finer spray may be used in this treatment than in the first two. So far as possible, spraying when the trees are in full bloom should be avoided.

The treatment above outlined is particularly applicable to prunes, cherries and pears, when the bloom is fairly uniform in its development. In orchards where the bloom is irregular in making its appearance, or is spread over a long time, some modification in the outlined schedule may be necessary; that is, more spraying may be required, or it may be impossible not to spray when some of the bloom is in evidence. Good results from this treatment have been obtained upon cherries, pears and prunes. However, the pest is more difficult to control on pears than on prunes, and on prunes than on cherries.

Results of Treatment.

Early in the government investigations, the fact became plain to the men in charge of the work that not all the shortage in the Santa Clara Valley was due to the thrips. A poor physical condition of the trees, caused by a lack of plant food or water, was responsible for much of the damage laid by some of the thrips. The ravages of the thrips were also more pronounced on these poorly nourished trees. Accordingly the application of fertilizers to some of the thrips infested orchards seemed desirable. Such applications were made in much of the demonstration work in the Santa Clara Valley.

The writer of this paper is greatly indebted to Paul R. Jones of the U. S. Department of Agriculture for the following facts and figures relating to the demonstration work for the season of 1911.

In connection with this work it is only fair to state that the thrips conditions in the Santa Clara Valley this year were not as bad as in some previous years. This state of affairs may be accounted for by the heavy rains at blossoming time in 1910, which probably washed many immature thrips to the ground where they undoubtedly perished, and by the abnormally dry fall which may have interfered with the proper development of the insect at the time of pupation and change to the adult form. In consequence of these conditions, the results of the demonstration here detailed are not so pronounced as they would have been had the thrips infestations been as severe as was anticipated.

In the prune orchard of Mr. H. Curry three plats were laid off. Plat No. 1 was sprayed twice and fertilized. Plat No. 2 was sprayed twice. Plat No. 3 received no treatment. The cost of the two spray applications was $13 per acre, and $20 worth of fertilizer was used on Plat No. 1. The yield of this plat was at the rate of 635 boxes of green prunes per acre. Making proper allowance for shrinkage in curing, and

STAR PORTABLE DRILLING MACHINES

They're Still Running

As steady, quiet, and even as a clock, after years of hard service, and that in every kind of place and under every condition. That affords a driller a lot of satisfaction and saves a wonderful lot of expense, time, and worry That's why

FERRY'S SEEDS

Plant breeding and selecting has been our business for years. We market the results in the shape of thoroughbred vegetable and flower seeds. They grow good crops.

1912 SEED ANNUAL FREE ON REQUEST

D. M. Ferry & Co., Detroit, Mich.

figuring on a 5.75 cent basis price per pound for the dried fruit, the product of this plat was worth $513 per acre. The yield from Plat No. 2, sprayed only, was 593 boxes per acre, worth $471; from Plat No. 3 the check 486 boxes per acre were obtained, valued at $391. The gain due to spraying in plot 2 was $67 per acre, and on plot 1, after making allowances for the $20 worth of fertilizer used, $89. The foregoing figures may not sound very impressive, but it should be remembered that the effect of the treatment is cumulative, and the next year the sprayed portion of Mr. Curry's orchard ought to be comparatively free from thrips. On the other hand, the unsprayed portion will probably be badly affected, unless all signs of an abundant crop of thrips next year fail.

Mr. Fellows, of the Quito ranch, is also an earnest believer in the efficacy of the spray in his prune orchard. During the past season he sprayed his entire prune orchard of 250 acres twice, and 195 acres of it three times. The total cost of his spraying operation on 195 acres was $2577.82, divided as follows:

Labor, 235 days, $2 per day	$ 470.00
Horses, 210 days, $1 per horse	210.00
Commercial emulsion, 89½ bbls. at $6.10	581.75
Blackleaf, 55½ 5-gal. cans, 90c	249.79
Blackleaf 40, 45.2 at $12.50 gal.	565.00
Gasoline, 144 gals. at 15½c	22.32
Lubricating oil, 20 gal. at 45c	9.00
Cartage	45.00
Interest and depreciation of outfit	425.00
	$2,577.82

The Blackleaf was used at the rate of one to 100; Blackleaf 40 used at the rate of one to 2000. There were 90 trees to the acre. Each application cost nearly five cents per tree, or about $13.50 per acre for the season's spraying of three applications. The yield of the 195 acres for the year 1910 was 222 tons of green fruit, a large part of which was scabby. The yield from same 195 acres in 1911 was 648 tons green fruit of good quality. Figured on a 5 per cent basis, making an allowance of 2½ to 1, the 1910 crop was worth $11,800, or about $60 per acre. The 1911 crop was worth $34,450 or about $176 per acre. Mr. Fellows attributes this net gain of $100 per acre almost entirely to spraying. He is going to purchase two more spray outfits, making six in all, so that if necessary, he will be able to make timely applications on the entire orchard the coming spring.

Even more decisive results on pears than on prunes in the county of Santa Clara could be shown were there time to do so.

Mr. T. W. Dean, Courtland, California, is another grower who has made use of the government formula. He made good thorough applications on pears, peaches, plums and cherries. He does not fear the pest in plums, peaches, or cherries, and is confident that he can control it on the pears when the buds open uniformly. He notes that his crop from the tops of the pear trees (he did not have a tower on his spray outfit) was inferior in quality and quantity to that of the lower limbs, which received a thorough application of the spray.

Instances of the sort, given in the foregoing, could be multiplied indefinitely. In this connection, however, it is only fair to state that some men who have sprayed conscientiously and thoroughly have not obtained the desired results during the past season, particularly on pears. However, these individuals and others should bear in mind that the results are cumulative, and that another year of spraying will probably place the pest under control in their orchards.

Lime Spray.

Mr. Morris, the county horticultural commissioner of Santa Clara County, reports that he has had excellent results on pears with a simple whitewash spray. His solution is made by slaking lime in water, using as concentrated a solution as it is possible to apply, from 75 to 100 pounds of lime to each 100 gallons of water. Care should be taken to secure first-class lime and to slake it well. The cost of this spray all made up, should not exceed one cent per gallon. The spray should be applied just as the buds begin to separate and the entire surface of the tree should be covered. One application is sufficient. Although Mr. Morris gives no exact statement of the results, he assures me that eight times as many pears per tree were taken from the sprayed trees as from the unsprayed trees.

Testing for Thrips.

Many growers are puzzled to know whether or not their ground is infested with thrips. For the benefit of these and others who wish to know just how badly their soil is infested, the government method of determining the intensity of the infestation will be demonstrated. To secure a sample of the soil, the loose layer, to a depth of three or four inches, is scraped away, and a five gallon oil can, from which the top has been removed, is inverted on the hard soil thus exposed. The soil is then removed from the edges of the can, which is sunk to its full capacity over a section of soil. When the can is sunk as deeply as possible, the inclosed section of soil is cut off at the bottom, the can turned right side up and transported with its contents to the place of examination. A section of the soil six inches square is then examined by passing small quantities through a screen.

If the thrips are in the larval or pupal stage, black paper is used to collect the soil particles passed through the screen. If the insect is in the adult stage, white paper is better. A record is kept of the number found from each inch of soil examined, from which an estimate of the number of thrips per square foot may be obtained.

Summary.

If your orchard is badly infested, you ought to spray early, thoroughly and late. The results the first year may not be decisive, but at the end of two years of intelligent spraying, the pest will be under control.

FARMERS' DIARY.

A novel form of diary has been issued by the Rein & Sons Company, Houston, Texas. It is called "The Farmers' General Diary and Record," and if the blank pages in the book are fully filled in a record of great value will be possessed by the farmer at the end of the year. The text taken by the author is "Father, forgive them, they know not what they do," and he thinks of all the classes of ever struggling, hard-working humanity the farmer class is the one most in need of that forgiveness. The charge is that while the farmer as a class is as brainy as any other, he has not arrived at the stage of fully using his intelligence, especially as to knowledge of details of his own place. There is a blank for every day in the year, for entering weather, temperature, precipitation, condition of soil, conditions of crops in general, number of men employed, cost, amount of work done on the farm, any product marketed, details of expenditure, and other items too numerous here to mention. There is another sheet of 52 blanks for Sunday and weekly recapitulation; another sheet for monthly record and balance sheet; another sheet of annual crop record recapitulation. The only objection that we can see to the book is that it is rather too elaborate for many farmers.

Sweet Peas
Send for Our
1912 Novelty
Sweet Pea Collection
No. 1
Sweet Peas are our Specialty. We were among the first to grow the seed in California and we are now the largest growers in the world.

LILLY'S SEEDS
These 3 Vegetables for 10 Cents
SWEET PEAS
LILLY'S ROYAL MIXTURE
5¢
This is not a bargain, but an introductory offer to get you interested in Lilly's Seeds, and to prove to you their quality and reliability.
LILLY'S "DELICIOUS" LETTUCE. A variety introduced by us, very early with fine, hard, medium-sized heads, rich yellow heart, with a delicious buttery flavor.
LILLY'S "EARLIEST OF ALL" RADISH. A very small, round, bright red radish with white, crisp flesh of a delicious, mild flavor. An excellent variety for cold frame.
LILLY'S "NEW WHITE QUEEN" ONION. A very early, small, round variety of fine, crisp flesh, with a deliciously mild flavor. A great favorite for the home garden, easily grown and matured.
The above three varieties are all regular 10 cent packages. We offer the three for 10 cents to introduce. Send money order or stamps.
Catalogue Ready for Mailing, Free
Send for a copy of Lilly's Annual Seed Book, 126 pages, fully illustrated with cultural directions.
Lilly's Seeds are the Standard of the West. They have given satisfaction to farmers for over a decade. They are particularly adapted to the climatic and soil conditions of the West Our seeds are tested by us before being offered for sale. We have an expert seed tester, a government graduate.
Chas. H. Lilly Company, Seattle, Washington

Onion Sets
We have a small surplus of both yellow and white sets in fine condition,—solid and firm. While they last we can make you enticing prices in quantity.
ALFALFA SEED
New crop, recleaned. No ALFALFA WEEVIL where this seed was grown.
Let us mail you free our 1912 "HINTS on GARDENING" and seed catalog.

General Agriculture

SECRETARY WILSON'S ANNUAL.

Brief Comment on Annual Report of Secretary of Agriculture.

When the cattle fever tick is destroyed in the Southern States the country will get much more meat from that section, and the producing of it will build up the farms there.

The hog cholera serum developed in this department is successful where it is properly made and applied.

Would it be asking too much of our universities to have them educate more plant pathologists and road engineers?

Every country in the world that has diseased plants that can not be sold at home can ship them to us. This results in great loss. The chestnut disease here is an illustration.

After years of experimentation we find we can grow Egyptian cotton in Southern California and bulbs in the state of Washington.

The finest dates from the Sahara Desert succeed in our Southwest.

No seed is sent out from this department without being tested for germination condition.

The schools want more of our publications than we have to give them.

Seven hundred and fifty million dollars is the best estimate for poultry products this year.

The day is not far distant when we will cease to import potash.

A serious pest in the South is the crayfish; carbon bisulphide is a sure remedy.

We are sending explorers to the ends of the earth for new plants—and getting them.

The phosphates are abundant in our country for all possible uses. Florida, Kentucky, Tennessee and Idaho may be mentioned as depositories.

If good roads from the producer to the consumer were general, the benefits to both would be considerable.

When a foreign insect invades, our scientists seek its enemy where it came from. The natural enemy of the boll weevil was an ant that could not endure our winters, but the native ant is getting busy.

The experiment stations of the several states are doing better work each succeeding year, the scientists are maturing, and the people are appreciating.

The object lesson in agriculture is the best teacher; we had 60,000 of them at work last year.

Six hundred thousand short tons of beet sugar were made last year in 67 factories. There is an estimated world's shortage of 1,600,000 long tons of sugar this year.

The consumer pays a dollar for food; the farmer gets less than fifty cents for it. Who gets the rest?

All government agencies that conserve public health should be grouped together in one bureau.

The Department of Agriculture has had success in the Southern States through object lessons in the fields, where the best southern farmers in their counties were the instructors. This method should be organized in all the states along lines of greatest necessity.

Our systems of renting land are faulty and result in soil robbing; where the renter can not provide domestic animals, the owner should arrange to furnish them, so that rotation of crops may be had, and hay and grains may be fed on the farm.

Irrigation will bring maximum crops while the land is new and full of plant food; but where the crops are sold year by year irrigation will not of itself assure good results.

Alaska will some day provide farmers in lower latitudes with grain seeds superior to what they can grow at home.

The corn crop is moving northward by seed selection.

The southern farm boy is showing the way to grow more of all crops on an acre.

Educate the farmer's boy toward a more valuable life on the farm.

Uplift the farm home through the education of the farmer's daughter toward greater usefulness and attractiveness in the farm home.

Save all the liquid fertiilzers on the farm, in cisterns, to be applied where crops are to grow; this will recover the greatest farm waste of our times.

There is great promise in the fact that whole classes of graduates of agricultural colleges go back to the farms, having learned how to make them profitable.

Our foresters are learning by experiments how to reforest 30,000 acres in a year; 10 times as much must be planted annually to cover all the bare acres in a generation. It will be done.

There should be publicity regarding the cold storage of foods, through monthly reports to some Federal authority that would give them to the press, to the end that the people might know to what extent foods were being withheld from consumption.

EVERY FARMER HIS OWN PAINTER.

Any man can do an average job of painting, and can thereby not only improve the appearance of his place, but can add greatly to the durability of the buildings.

The average farmer, if there is such a thing, seems to think that paint is used solely for ornament, and he is of all men most keenly practical, he eschews what he regards as an unprofitable luxury. It is perhaps the rule rather than the exception in some sections to see houses and agricultural implements sadly in need of repainting.

Of course paint does improve the appearance of property, but it is far more useful as a protector rather than an ornament. The expenditure of a small amount of money and time in painting a valuable piece of farm machinery or a building will add greatly to the length of its life. Another useful object accomplished by painting is the improved sanitary conditions of buildings and outhouses. The cost of such work is small, the necessary equipment not expensive, and with proper care will last a long time.

In order to supply information which will enable the farmer to purchase the paints economically and apply them intelligently and to the best advantage, experts in the Bureau of Chemistry have investigated the subject and prepared Farmers Bulletin No. 474, calling attention to the economic importance of painting farm buildings and equipment and giving details as to the cost, purchase and care of brushes, cost of the ingredients needed, how to mix and apply them.

Paint conveys to the casual reader the idea of a mixture of pigment with linseed oil, but the general conception

Kenwood, Sonoma County, Cal.

Santa Barbara County raised 295,000 tons of sugar beets last year.

of the word includes both whitewash and calcimine, but not varnish, and the bulletin gives several very valuable recipes for making both of those excellent coatings for both the out and inside of buildings.

The Secretary, in addition to urging the proper use of paints for both useful and ornamental purposes, for he does not think anything too good or attractive for the farm homes, emphasizes several precautions: "Do not use any paint containing compounds of lead about stables or outbuildings where the fumes from decaying organic matter occur, since these gases are likely to darken the lead paints. Do not use with lead compounds any pigment which may liberate compounds of sulphur. For example, ultramarine blue white contains sulphur in a form in which it may be set free, is a beautiful and very permanent blue, and may be used with zinc white, but should not be used with white lead or any other lead pigments. Prussian blue, on the contrary, does not contain sulphur and may be used with lead pigments.

"Remember that turpentine and benzine are very inflammable, and especial precautions should be taken not to bring paint containing these substances near any light or open fire.

"Many pigments are poisonous, and the workman should be particularly careful to remove all paint stains from the skin, and not under any circumstances allow any of it to get into his mouth. A man should not eat in the same clothes in which he has been painting, and before eating should not only change his clothes but wash all paint stains from his skin. It is not advisable to use turpentine or benzine in removing paint stains from the hands, but by oiling thoroughly with linseed oil, or, in fact, with any fatty oil, and then thoroughly washing with soap, the paint may be removed, provided it has not been allowed to dry too thoroughly on the hands."

JAPANESE VEGETABLE ISINGLASS

By Consul George N. West, Kobe.

Japanese isinglass, or agar-agar, is made from six kinds of seaweed, the best qualities of which are found on the coasts of the provinces of Izu, Tosa and Sado and are known as Izu, Nanbu, Misaki, Onikusa, Egokusa and Hirakusa. (Samples of the various kinds of seaweed mentioned are filed in the Bureau of Manufactures.) At the close of summer the seaweed is bought up by wholesale dealers in Osaka and stored there in godowns until sold to the manufacturers. The different seaweeds are sold for the following prices per 10 kwan (kwan equals 8.267 pounds avoirdupois): Izu, $8.50; Nanbu, $8; Misaki, $6.75; Hirakusa, $3.75; Egokusa, $7.50; Onikusa, $5.50.

The manufacture of vegetable isinglass, as its Japanese name, kanten (cold climate), would imply, can take place only in autumn and winter, as warmth and rain spoil the product. The process is simple, and the utensils employed are primitive. The factories are located at Ibaraki, in the mountains between Osaka and Kyoto, and at Nishinomiya, between Osaka and Kobe.

To make 4,000 kin (1 kin equals 1.3227 pounds avoirdupois) of isinglass 2,050 kwan of seaweed, of a value of $1,410, are required. Coolie hire and other expenses are about $350, which, added to the cost of the seaweed, makes the total expense incurred in producing 4,000 kin (5,291 pounds) of isinglass $1,760.

The Method of Manufacture.

The process of manufacture may be described as follows: The seaweed is first crushed, each kind separately, to remove shells or other adhering matter, and then washed clean with water. The washed seaweed is placed on a mat and dried until its color becomes white by the action of the sun, frost and dew. This operation takes place during September and October, and when bleached the weight of the seaweed is decreased nearly one-half. After bleaching, the six kinds of seaweed—in the proportion of Izu, 4; Egokusa, 4; Misaki, 3; Hirakusa, 3; Nanbu, 4; and Onikusa, 2—are all put together in a boiler and cooked for about fourteen hours, until they have become soluble. The liquid is then strained through a sack and a box with a bamboo sieve on one side, from which it runs into a container. From the container the liquid is ladled into trays about 3½ feet long and 3 inches deep.

After remaining in the trays about twelve hours these are placed on a low stand, and the isinglass is cut into strips three inches wide and fourteen inches long, with a knife and ruler. These strips are then put into a long closed wooden box (the ends of which are three inches square, one end being open and one filled in with a wire sieve) and pushed through the sieve end in the form of long fine strips. The isinglass is then placed on a low stand, which is covered with a clean mat, and dried in the sun during the day and frozen during the night for two or three weeks during January and February, being watered at midnight. The quality of the isinglass depends upon the weather during this time, the best being made when it is clear and cold, the poorest when it is warm and rainy. When the isinglass is bleached sufficiently, it is compressed and packed in Japanese matting, tied with a straw rope.

The very best quality is all exported to China, the No. 1 quality that is shipped to America being equal to the No. 2 that goes to China.—Consular Reports.

TURKISH OLIVE CROP.

By Consul General Gabriel B. Ravndal, Constantinople.

The 1911 olive crop is excellent over the entire district of the Gulf of Mudania-Ghemlik, on the southeastern arm of the Sea of Marmora, which is famous for olives. It is believed that it will amount to 28,283,305 pounds for the district of Mudania and 42,425,707 pounds for the district of Ghemlik and Yeni Bazar. In the latter district the crop would have been still larger, but the fruit was injured by hail and the production was somewhat diminished.

The quality is excellent, as the fruit was free from disease during its growth. It is natural, of course, that owing to the great abundance the size of the olives will be small.

Three-fourths of these olives will be pickled for eating purposes and the remainder used for oil. In the whole district of the Gulf of Mudania-Ghemlik the production of oil this year will amount to between 3,400,000 and 4,300,000 pounds. Three-fourths of this oil will be consumed here and perhaps one-fourth will be exported.

LARGE OLIVE CROP IN GREECE.

Consul General William H. Gale, of Athens, reports that the gathering of the olive crop has begun, and it is said to be the best produced in Greece for forty years as to both quality and quantity. It is estimated that the yield of oil will be from 75,000,000 to 90,000,000 okes 26,000,000 to 32,000,000 gallons.

MEXICAN LAND

EVERY DAY BRINGS THE PANAMA CANAL NEARER TO COMPLETION.

WHAT ARE YOU DOING TO REAP A PROFIT?

ARE YOU MAKING AN INVESTMENT WHERE YOUR $$$ WILL EARN MORE $$$$$$$$ EVEN BEFORE THE CANAL IS COMPLETED?

THE WEST COAST OF MEXICO WILL BE BENEFITED MORE BY THE CANAL THAN ANY OTHER SECTION.

NOW THE QUESTION IS:

WHAT PART WILL ADVANCE THE QUICKEST?

ANSWER: THAT PART WHICH HAS THE MOST NATURAL ADVANTAGES AND A CLIMATE SUITABLE FOR AMERICAN SETTLERS.

THE CULIACAN VALLEY is just below the frost line, yet far enough north to avoid the disagreeable tropical features.

Ample rainfall for one crop and some years two.

Abundant water for irrigation when necessary.

A larger variety of products than any other section of the continent.

Markets for everything.

Excellent transportation facilities.

Cheap and efficient labor.

In the Culiacan Valley the American Farmer can raise the products he understands best and turn a portion of his land into a money making tropical garden.

The soils are deep and rich; no fertilization necessary for fifty years.

FARM LANDS AT $10.00 TO $25.00 AN ACRE ARE SELLING FAR BELOW THEIR INTRINSIC VALUE.

Fibre and range land at lower prices still.

THERE IS A FORTUNE FOR YOU IN SINALOA IF YOU SELECT YOUR LAND WITH DUE REGARD TO SOIL AND LOCATION.

A PLEASANT, HAPPY LIFE WHILE MAKING THE FORTUNE.

If you are interested in bettering your condition or investing where the largest returns compatible with safety are to be had, our literature will interest you.

DON'T DELAY, PUT IT OFF, OR FORGET IT.

Irrigation and Forestry

FORESTRY IN OUR COUNTRY SCHOOLS.

Educators at the present time are beginning to make a more practical application of the subjects taught in our schools and colleges. So in considering the question of how much forestry is it practical to teach in our country schools, we must first answer the question of, how much use do the pupils in our country schools make of trees? The extent to which trees are used varies of course with local conditions, but we can find a number of general uses quite common to our country communities.

The boy does not have to be very old before he wants a bow and arrow, and right then we may begin to teach him the best kind of wood for bows and arrows, how to cut the limbs from the trees with the least amount of damage, and some of the most prominent characteristics of trees. His acquaintance with the birch may begin still younger. Mine did, and I can tell that tree anywhere today, because of the close acquaintance I had with it in my youth. Nut and acorn trees, the boy knows in a general way because of the fruit which they bear, but by building upon his knowledge of and interest in the trees because of their fruits he may be taught their other characteristics, their commercial value and habits of growth. The sugar maple is distinguished because of the quality of its sap and here again is a basis upon which I built a knowledge of all the maples.

Much of the damage done to nut and other trees by the boy is done through ignorance and carelessness. If he were taught more about trees, their seeding and growing habits, the injury caused by making wounds in the bark; if he could set out and raise some trees that he would feel were his own, the trees would become such close friends of his that he would come to be their natural protector.

Again, a few visits with proper instruction to where a house is being built, a fence being put up, a wagon in the course of construction, also a trip to the neighboring sawmill would give him very valuable lessons in the uses of wood.

The problem at once arises as to who will teach the boys these various things since the average country school teacher is not prepared for this work. There are several ways out of the difficulty. The teacher may become informed by study with the aid of the State and National Forestry Bureau. Excellent bulletins, dealing with the teaching of forestry in country schools may be obtained from the Department of Forestry at Washington, D. C. The teacher may receive some practical help from carpenters, carriage manufacturers and mill foremen. Undoubtedly the demand for such subjects will force the normal school to offer instruction along this line in the near future. The normal school is the place where teachers should be prepared for this work. Meanwhile we have our summer schools where teachers may receive excellent training in the teaching of forestry.

This article is not intended as a finished discussion of the teaching of forestry in our country schools, but only as a suggestion of a way in which the country boy may get a little more out of his school experience by becoming better acquaited with his surroundings. Thus will be found life in the country more valuable and more attractive.—O. E. Huse, Pennsylvania College.

CALIFORNIA'S IRRIGATION STATISTICS.

Director Durand issued today the first official statement from the Bureau of Census, Department of Commerce and Labor, relative to the statistics on irrigation in California. It is based on a preliminary comparative summary submitted by Dr. Le Grand Powers, chief statistician for the division of agriculture in the Bureau of the Census, under whose supervision it was prepared by R. P. Teele, special agent in charge of irrigation. It should be noted that the figures are subject to revision, after more complete tabulation, but it is not expected that there will be any material modification of the totals or percentages reported.

Acreage, Equipment and Cost.

The total number of farms irrigated in 1909 was 39,352, against 25,675 in 1899, an increase of 13,677, or 53.3 per cent. Between 1899 and 1909 the number of all farms in the state increased 21.6 per cent. The per cent irrigated of the whole number of farms in 1909 was 44.6. In 1899 the per cent was 35.4, showing an increase in per cent of 9.2 during the 10 years.

The total acreage irrigated in 1909 was 2,664,104 acres, against 1,446,114 acres in 1899, an increase of 1,217,990 acres, or 84.2 per cent. The total acreage which all enterprises were capable of irrigating in 1910 was 3,619,378 acres, an excess of 955,274 acres over the area irrigated in 1909. The area included in projects either completed or under construction in 1910 was 5,490,360 acres, an excess of 2,826,256 acres. This indicates in a general way the area which will be available within the next few years for the extension of irrigation, and shows that the area irrigated in 1909 can be more than doubled without the construction of additional works.

The number of independent enterprises reported in 1910 was 13,970. The total length of all ditches was 21,129 miles, of which 12,599 miles were in main canals and 8530 miles in laterals. The length of main canals reported in 1899 was 5106 miles, showing an increase in the ten years of 7493 miles, or 146.7 per cent. The number of reservoirs reported was 1604 having a combined capacity of 743,269 acre-feet. The number of wells pumped for irrigation was 10,710, and the number of all pumping plants was 9267. The engine capacity of pumping plants was 123,590 horsepower. The acreage irrigated with pumped water was 309,134 acres. Flowing wells supplied water to 55,818 acres.

The total cost of irrigation systems reported in 1910 was $72,445,669, against $19,181,610 in 1899, an increase of $53,264,059, or 277.7 per cent. The average cost per acre was $20.02 in 1910, against $13.26 in 1899, an increase of $6.76, or 51 per cent. The average cost of operation and maintenance per acre in 1909 was $1.54.

The acreage irrigated in 1909 has been classified according to the state and federal laws under which the works were built or are operated, as follows: United States Reclamation Service (act of Congress July 17, 1902), 400 acres, or less than 1 per cent of the total; United States Indian Service (various acts of Congress), 3490 acres, or 0.1 per cent of the total; irrigation districts, 173,793 acres, or 6.5 per cent; co-operative enterprises, 779,020 acres, or 29.2 per cent; commercial enterprises, 746,265 acres, or 28 per cent; and individual and partnership enterprises, 961,136 acres, or 36.1 per cent. United States Reclamation Service works are to be turned over to the water users for operation and maintenance as soon as they are paid for. Including these, 71.8 per cent of the acreage irrigated in 1909 was supplied by works controlled by the water users.

Streams supplied 2,265,032 acres, or 85 per cent of the total acreage irrigated in 1909; lakes supplied 18,470 acres, or 0.7 per cent; wells supplied 332,413 acres, or 12.5 per cent; springs supplied 31,779 acres, or 1.2 per cent; and reservoirs supplied 16,410 acres, or 0.6 per cent.

Bees and Their Care

RIPENING HONEY.

One of the most essential things that bid for success is room sufficient to keep every bee working to the limit, and everlastingly at it. Valuable time is often lost, even when there is little sealed honey in the hive; colonies with scarcely a cell sealed become as completely blocked from a field-worker's standpoint as though every cell had been sealed. I learned this bitter experience during 1909, when my hives became filled to the limit; but there was little sealing done, because the bees would not seal until the honey was properly ripened, and the ripening was slow in the extreme. Where there were extra combs to supply room, the yield per colony was far greater, showing conclusively that plenty of empty combs are a most valuable asset to an extracting apiary.

This honey was from the orange, principally, which yields the thinnest nectar, and, besides, was gathered when weather conditions were not favorable to the rapid evaporation in the hive. With the sage it is different, the nectar being much more easily reduced, and the weather conditions more favorable. We can often extract this when no more than half sealed, yet have a splendid honey in all respects.

Successful management depends on having every colony treated as regards its own condition. When a colony is ready to extract, the work should be attended to immediately, without waiting for the entire apiary to get ready, or even enough for a day's extracting, for valuable time will be lost by some colonies before others are ready.

One year, when the season was half over a friend of mine who had had but little experience, allowed his hives to remain full and sealed because he had read that honey should be left on the hives until well ripened. Think of it! hives full, sealed, and waiting, and a honey flow on that would yield to any good colony not less than 5 pounds daily! There are some who go to the other extreme, and wait for little sealing under any condition, removing mere nectar at times when buyers sometimes refuse to handle for lack of body and danger of souring in the can. Others seek to do things on a big scale. They have several yards which they run on the let-alone plan until harvest time, when they rush into the yard with a power extractor, and begin on one side and strip it clean. If the owners of such yards are late, and the hives have been full for seven or eight days, from 5 to 8 pounds of honey lost per day for lack of room, they are none the wiser, but go on with a feeling of satisfaction that they are "boring with a big auger." Details are lost sight of; swarms are let go, and conditions are not watched closely. The day is coming when these men will finish up with a gimlet!—Chadwick in Gleanings.

FALL TREATMENT FOR AMERICAN FOUL BROOD.

The usual method of shaking as treatment for foul brood, during the honey flow, is not advisable in the fall after the flow has slackened. A diseased colony, deprived of combs and honey, and with nothing but starters to build upon, will not get enough honey stored to winter. If diseased colonies are weak in numbers it will probably be cheaper to destroy the bees and render the honey and wax. Where the colonies are strong and the disease has not depleted the numbers they may be shaken upon solid combs of honey after brood rearing has ceased. This treatment will require combs of honey entirely filled so that no cells will be left in which the bees may store any of the infected honey which they carry from the old hive in their honey sacs.

Even if the disease has not gained a foothold in the apiary, there may be as many queenless colonies as diseased ones. A queenless colony in the fall cannot winter, so that a very feasible plan is to shake the queenless colony and the diseased colony into a clean, new hive with starters on the stand of the diseased colony. The queen of the foul colony is caged with the bees in this new hive to prevent the swarm from absconding, and to prevent the bees from the queenless colony stinging the queen. After three days the combs of honey from the queenless colony may be put into the hive and the frames of starters removed. The queen may now be released and the bees will be ready to form their winter nest. This transferring may be done during September or October. The diseased combs of honey may be rendered and disinfected by boiling at least thirty minutes in a closed vessel.—Wesley Foster, Colorado State Bee Inspector.

CONVENTION OF NORTHERN CALIFORNIA BEEKEEPERS.

The Northern California Beekeepers Association will hold its sixth annual convention at Pythian Castle, 831 I Street, Sacramento, on Wednesday and Thursday, Dec. 27 and 28, 1911.

The convention will be called to order at 10:30 a. m. by L. D. Walker, who will deliver the address of welcome. This session will be a short business meeting, devoted to preliminary work. Many speakers will be present, all of whom are expected to take an active part.

Afternoon Session.

Reading of the minutes of last meeting and treasurer's report. "Shall I Produce Comb or Extracted Honey?" "Inspection Work." "Effect of Unripe Honey on the Market." "What Race of Bees Shall I Select?" "Foul Brood in Northern California."

Thursday.

10:30.—"The Value of Organization." Arranging and framing a bill for state inspector. To arrange methods for communicating with all associations of the state, exchanging ideas, amending bill to suit the great majority of beekeepers of the state, standing loyal to all.

Afternoon Session.

"Election of Officers." "Purchasing of Supplies." "Good Queens." "Building Up Bees for the Honey Flow." "The Protection of the Home Market and the Handling of Our Own Product."—B. B. Hogaboom, Secretary.

A Practical Cultivator

THIS cultivator is very practical for deep or close cultivation, and where plants are to be cultivated without hilling. The strawberry grower will find this cultivator most valuable to loosen the soil around the plants without throwing dirt upon them. It can be used to great advantage in cultivating blackberries, raspberries, vines, hops, etc. It is furnished either with straight or zigzag bars. The expanding lever is of the most improved type. It works easily and holds the bars rigidly. This lever enables the driver to cultivate between rows of different widths without stopping to readjust the cutting width of the cultivator. Come in and let us show you this cultivator. It is certainly an ideal machine for the purpose for which it is intended.

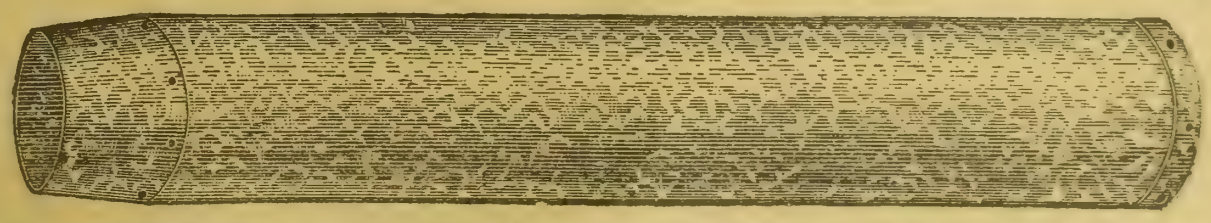
SAVE YOUR TIME WATER and GRADING BY IRRIGATING WITH AMERICAN SURFACE IRRIGATION PIPE



The PIPE RECOMMENDED BY ALL USERS. It is the ONLY SCIENTIFICALLY CONSTRUCTED SURFACE IRRIGATION PIPE on the market. THERE'S NO ROUND SEAMS TO LEAK, retard the flow of water or weaken the pipe. This pipe is easily handled and cheaper than flumes. It will last a life-time. For irrigating alfalfa it is the only pipe to use. We make RIVETED PIPE AND TANKS. Write for Illustrated Catalogue, also SPECIAL IRRIGATION FOLDER which may mean much to you.

HOUSEHOLD DEPARTMENT.—Christmas Story, Poem and Recipes; 665, 666, 667.

MARKETS 668 669

SAME TO YOU."

The Cultivator hopes for each reader the merriest kind of a Christmas and a happy closing of the old year.

THE BIGGEST IN THE WORLD

California is now ready to claim another "Biggest in the world" in a thousand-acre almond grove to be planted at Banning, Riverside County. Only 200 acres will be planted this year, and as trees can be secured the remainder of the thousand acres will be planted.

QUARANTINE

Europe is receiving absolutely none of American produced plants. This is caused by the fear of American grown insects or fungus pests. Why should not American horticulturists demand as much wisdom on the part of our government?

REPORT OF CONVENTION.

The state horticultural commission is now mailing the proceedings of the Thirty-ninth Fruit Growers Convention which was held at San Bernardino last March. All addresses and discussions are given in full. As the convention was entirely devoted to citrus matters this report affords a valuable handbook to the citrus grower.

STATE CONVENTION.

This is the week of the State Fruit Growers Convention held under the auspices of the state horticultural commission. Dr. A. J. Cook presides, making his first appearance before the fruit growers of the state as commissioner. The people of Santa Rosa are sending out invitations and urging every member to be present. They promise a loyal time and a typical Santa Rosa welcome to all who come.

THE WORLD OVER.

The Cultivator starts a new feature this week in agricultural news notes the world over. They may be found on Page 661 and like the four columns on the opposite page, afford opportunity for one minute's reading at a time. For a spare moment when a longer article cannot be read we like to have Cultivator readers supplied with opportunity for improving that moment.

WALNUTS.

The walnut growers are still holding to the price fixed early in the season, which was fourteen cents for number ones. The buyers have continued in their endeavor to bear the market and practically no sales are being made. It is rumored that some of the associations are weakening and manifesting a willingness to slightly shade, but so far we have not been able to verify the rumors, and members assert positively, "We are standing pat and will not budge from our prices."

AYRSHIRE MEETING.

The thirty-seventh annual meeting of the Ayrshire Breeders Association will be held in New York January 11, 1912, for the purpose of hearing reports of secretary and treasurer, and for the election of officers for the year ensuing. A meeting of the executive committee will also be held.

It is proposed to make an addition to the advanced registry rules so as to allow a cow as many annual registrations as her annual tests qualify her for, and to give her an aggregate record for all consecutive years' records, as a long term record.

The secretary of the assosciation is C. M. Winslow, Brandon, Vt.

COTTON.

Texas remains the banner cotton producing state of the Union; its output this year was 2,157,832,000 pounds. Georgia comes in second with 1,223,168,000; then come Alabama and South Carolina, and other southern states, with California down next to the "and others" with only 5,258,000 pounds. In increase over last year California stands at the head of the list, for while the output in 1910 was 5,986 bales, this year's nearly doubled that; in other words, reached about 11,000 bales. Watch California's cotton.

PLANT DISEASES.

Bulletin No. 218 is being sent out by the Agricultural Experiment Station at Berkeley. It touches upon California plant diseases and is written by Ralph E. and Elizabeth H. Smith. It first discusses functions of the various parts of the plant, showing wherein they may be affected by diseases, and gives the ideal conditions for the production of a crop, both as to air and soil, then goes directly to the common effects of injurious atmosphere and soil conditions in California, then to plant diseases with directions for treatment. This chapter, of course, occupies the principal part of the book. It is made most forceful by the liberal use of half tone engravings and drawings. The book has nearly 150 pages and should be in every fruit growers library.

LAND SHOW.

Los Angeles people are planning for an extensive land show to be held next month. It is timed so as to catch the tourists in greatest numbers, and if as great a success as the first one held a year ago, will be of value to the state. We may say, however, that there was some complaint on the part of exhibitors who felt that the attendance was not so great as it should have been. The displays were magnificent and possibly well worth the fifty cents admission fee asked, but many thought that for a purely advertising feature the admission was too high and this prevented satisfactory attendance and greatest benefit to the exhibitors. When an exhibitor pays $500 or $1000 for floor space in such an exhibit he feels that every inducement should be offered to people to come to see his display.

FERTILIZE THE WALNUT.

The Santa Ana Valley Walnut Growers Association is taking up the matter of increasing fertility of soil in the walnut groves. Its secretary, Mr. A. C. Tiede, is sending out request to every grower who has had experience with commercial fertilizer on walnuts to write as to results of applications. Some of the questions he asks are: "What kind of fertilizer do you use? What are the results of its use? What time of the year do you apply and how much per acre?" As we heard a prominent orange grower remark at one time, "I cannot afford not to fertilize heavily." He sometimes applies as much as 75 pounds of high grade fertilizer to each orange tree. How much the walnut can be forced remains for Santa Ana and other walnut growing sections to determine. The walnut is too valuable a product not to work it to the limit.

HAY.

California hay seems to be in a class all by itself. Alfalfa is close behind and even straw will soon be a luxury. The old joke on breakfast foods that they are simply parcels of baled hay will have to be recalled now, for one Los Angeles horse feeder has said that he is unable any longer to buy hay for his horses and is feeding them on shredded wheat biscuit. Joking aside, the drouth is causing all range stock to be brought in and fed on hay which was being stored for next spring's market, and if it continues much longer a very serious condition will obtain in all sections of the state. The rains persist in holding off far later than usual, but there is no occasion for discouragement, for in past years similar conditions have obtained, yet the season ended most successfully. Unfortunately the hay producers generally are not reaping the full benefit, for the speculators have stored the greater proportion of the stock in the warehouses.

RURAL EDUCATION.

At country life meetings and where the matter of rural education has been discussed, we have heard the expression, "Give to city people the education and other opportunities which will be agreeable to them, but give us in our rural schools what will inform the youngsters as to the life they are living." But we think the city may well enlarge greatly on its curriculum and give just a bit of information at least as to life in the country. Not long since a graduate of the Polytechnic High School in Los Angeles inquired, "Say, Dad; How is the stock from which Pasteurized milk is secured pastured any different from ordinary stock?" This young man was not even second cousin to the young lady graduate who, visiting in the country, inquired of the farmer as to a breed of poultry, and when informed that it was the White Leghorn, expressed chagrin in not observing for herself that the "larger hens" had horns on their legs.

ENCOURAGE SOCIAL LIFE.

In "Principles of Rural Economics," Mr. Carver remarks that "Of all the leading occupations in a civilized country there is none in which success depends so little upon social and so much upon physical energy and adaptability as farming, and there is none where life is lived and work is done in such intimate and direct contact with nature and so little in contact with other men." For that reason the farmer should break away from his natural inclination and develop his social side as much as possible. There is to the thinking man, especially if he is a bit imaginative, great satisfaction in contemplating nature in her different moods, but with all that pleasure the farmer should use every opportunity for developing the social graces. "Those who get their living out of others must of necessity be skilful in the arts of pleasing." With the farmer this is not the case and this has given occasion for the charge that rural people lack in urbanity. Such a charge is far less true today than it was a few years ago since so many factors have entered into lessening the distance between rural and urban people, not in miles and hours only, but in thought and action. This, we believe, will continue, until the farmer's lack of social polish will not be an occasion for remark on the part of his city cousin.

Agricultural News Notes of the Pacific Coast

Northern California

Marysville, Yuba County, is shipping heavily of hogs to San Francisco.

Sonoma County produced over eleven million gallons of wine the past season.

A fine display of apples was made at the citrus and olive exhibit at Oroville.

The Corning Poultry Show held last week was declared to be a complete success.

Lassen County is now pasturing numbers of cattle shipped in from Oregon, Idaho and Utah.

The Balfour-Guthrie ranch near Biggs is now harvesting a yield of about 1,800 sacks of rice.

A big irrigation system is under way which promises much for rich lands near Oroville, Butte County.

Almost 20,000 head of sheep are pasturing in the tules of Sutter County, and have been dipped for scab.

Santa Rosa Grange has elected S. H. Stone delegate to the State Grange, which will meet in Los Angeles.

The next trip of the demonstration train will be through the Southern Sacramento and Northern San Joaquin Valleys.

The management of the Cloverdale Citrus Fair is beginning preparations for the next fair, which will be held in February.

Tree lovers at Oroville are appealing for the preservation of some large oaks which happen to be in the way of sidewalk improvements.

The Penn Valley Creamery located at Grass Valley claims to be one of the best in the state and has closed a most successful season.

The Sutter Almond Growers Association at Yuba City shipped last week over thirty tons and the last of the season's output of almonds.

An olive grower near Chico, Butte County, has experimented with the spraying with water from pressure pipes as a frost prevention.

A triple installation of the officers of the Granges of Santa Rosa, Sebastopol and Bennett Valley will be held on January 13th at Santa Rosa.

Many turkey raisers of the Sacramento Valley report an epidemic which has taken off more than 30 per cent of the flocks. No remedy has yet been discovered.

The Eldorado County fruit growers have re-elected G. W. Ball, President, and A. L. Daniels, Secretary, of the organization which has succeeded so admirably in the standardization of fruit.

Complaint has been made against Horticultural Commissioner Earl Mills of Butte County on the ground that he has shown discrimination in rejecting infested fruit shipped in from Sacramento.

Glenn Ellen Grange in Sonoma County has elected the following officers: Andrew Erikson, master; Edward B. Payne, overseer; Mrs. Kate D. Hill, lecturer; W. C. H. Bruning, steward; Edward Stiger, assistant steward; Mrs. A. O. Gaige, chaplain; Charles J. Poppe, treasurer; Thomas Johnson, secretary; C. H. Lafferty, gatekeeper; Anna Erikson, Flora; Ida Stiger, Pomona; Mrs. C. H. Lafferty, Ceres; Mrs. J. D. Cobb, lady assistant steward; Edward B. Payne, trustee.

Central California

Lindsay has twelve orange packing houses running full capacity.

Watsonville forwarded over 3,500 cars of apples during the season.

Hollister shipped its first car of apples direct to Europe last week.

The spraying for peach blight has been general over Tulare County.

Madera will soon have a plant for the manufacture of irrigation pipe.

A stock grower at Turlock is introducing a mulefoot hog from Argentine.

California will produce this year nearly one million gallons of pickled olives.

Lindsay, Tulare County, produced about a hundred tons of olives this season.

Madera County reports extensive planting of deciduous trees for this season.

Lindsay, Tulare County, expects to pickle about a hundred tons of olives this season.

The president of the recently organized Farmers Association at Patterson is Walter Brown.

The close of the Emperor grape market was far better than indicated earlier in the season.

Tulare County is shipping more lemons this year than any preceding, and the market has treated them kindly.

As soon as the rains soak up the ground thoroughly Santa Clara County proposes to make a thorough squirrel campaign.

Stockmen of the San Joaquin Valley are fearful that the raisins will not come in time to give sufficient feed for the stock.

Tulare County dairymen are making the first effort at grading of cream. The effort is being watched by many dairymen of the valley.

Land owners near Madera are discussing ways and means to secure aid from state and federal governments to get water for that county.

Sanger, Fresno County, claims to be in the orange belt, and in proof reports over fifty cars of oranges shipped out within two weeks.

The roar which was raised in California because of false statements in a circular issued by an Arizona orange buyer has brought from the buyer a retraction and explanation.

Federal squirrel inspectors working in Madera County are urging a more strenuous campaign. They report that one farmer put out poison on a 200 acre tract, and so thoroughly did he do his work that not a single squirrel lived.

At the last meeting of the San Jose Grange Worthy Master E. T. Petit of the State Grange reported as to the last National Grange meeting, held at Columbus, Ohio. He said the last twelve months has shown the greatest increase in membership for over twenty years.

The Tulare County orange producers are in arms because of a circular issued by a merchant handling Arizona oranges. He claimed in the circular that the Tulare County fruit was unripe and could not be sold in any town which had a health department. season some Emperors are reported to have sold near the $2,000 per car mark.

Southern California

Glendora is shipping heavily of good ripe oranges.

Oxnard will market over $50,000 worth of English walnuts.

Orange County is shipping bell peppers and tomatoes to Seattle.

The last rain, while very light, has enabled plowing in several sections.

The Imperial Valley is now discussing the growing of ribbon sugar cane.

Santa Barbara's output of walnuts was 20 per cent heavier than last year.

The Santa Ana Register appeals for a model farm in every county of the state.

The Redlands Fruit Growers Protective League has re-elected former officers.

Thirty cars of Texas cattle, feeders, are being shipped to one ranch in Ventura County.

San Dimas, Los Angeles County, will produce about 500 cars of Navels and 150 Valencias.

The Southern California Arboricultural Association will meet at Redlands Jan. 12th.

Sugar beet growers in the neighborhood of Anaheim are signing contracts for the coming year and ordering beet seed.

While in New York auction last week Mr. C. C. Chapman of Fullerton saw a box of his Valencias sell at $17.25.

Saticoy, Ventura County, shipped fifty-five cars of beans and twenty-five cars of walnuts during the month of November.

Santa Barbara County reports the olive output as up to the average as to quantity and the fruit rather later than usual.

The branch of the State Experiment Station at Meloland, Imperial County, is reported to be doing some exceptionally fine work.

County Veterinarian Rowland of Los Angeles is urging the abolishing of public drinking troughs until the glanders is brought under better control.

An Indian on the Pala Reservation has beaten most of his pale faced neighbors and produced during last season an average of 40 bushels of corn per acre.

Bees are being shipped into San Bernardino County from Ventura County, also from Utah. Ventura County bee pasture has been greatly reduced by the recent forest fires.

The cotton exchange of Imperial Valley has received a proposition to erect mills and gin the cotton of the organization at $2.50 per bale. This is one-half the present rate and will save the growers over $25,000.

Sales Manager Little of the Arlington Heights Fruit Company of Riverside reports California navels in greatest demand in all of the Canadian Northwest country, which section he has recently visited.

The Covina Citrus Association in a annual meeting elected officers for the coming year as follows: President, C. S. Beardsley; vice president, J. R. Elliot, treasurer First National Bank; secretary and general manager, G. N. Atwood; other directors, A. M. Seeley, W. P. Watts, George E. Anderson, J. H. Brubaker, S. T. Berry, A. P. Kerckhoff, T. F. Griswold.

The Coast

Twin Falls, Idaho, is working for a sugar factory.

Freewater, Ore., ships about 20,000 tons of alfalfa yearly.

Spokane had 1,400 birds on exhibit at her poultry show last week.

Roseburg, Ore., shipped 11,000 turkeys for the Thanksgiving trade.

On Dec. 8th Spokane reported not a single case of fresh eggs in the market.

It is claimed that hens at Sheridan, Ore., are producing at the rate of $4.00 per head.

Over 7,000 sheep were ferried across the Columbia River at White Bluff, Washington, last week.

It is declared that this year's National Apple Show at Spokane has set a new standard for apple raisers.

Foresters of the Department of Agriculture are about to cruise the forests of the island of Mindanao.

The third annual meeting of the Northwest Livestock Association was held last week at Lewiston, Idaho.

The Oregon Poultry Association Show recently held at Portland was declared to be by long odds the finest ever.

Spokane and surrounding country are organizing to secure more just freight rates on wheat and other products.

At a meeting of farmers connected with the Weston project it was resolved to abandon the irrigation scheme.

Work on Logan Canyon Dam in Utah has been suspended because of protest of farmers whose land is to be submerged.

Taxpayers near Coeur d'Alene, Idaho, are protesting against the method of taxing realty and are organizing to secure justice.

Hop growers of Wasco County, Oregon, have gained national reputation as growing some of the finest hops in the United States.

The Eastern Klamath section of Oregon hopes to install an irrigation scheme which will cover about 30,000 acres of rich land.

Farmers at Columbia Valley, Wash., will round up coyotes and hope to kill the pests over 25,000 acres of sheep pasture land.

Yuma is having trouble with cattle rustlers, it being alleged that one bunch of forty-five head was recently run off by four Mexicans.

The premium list for the angora goat show to be held at Dallas, Oregon, Jan. 3-5 is now being issued. Only registered goats are eligible.

The Experiment Station at Pullman, Washington, is issuing instructions to nurserymen as to methods of fumigation of stock for insect pests.

Sensational charges that reclamation work has been ineffective in some Montana districts was made before the National Irrigation Congress.

At the election held in Arizona last week ratification of the statehood measure was practically unanimous and the first officers were elected.

Dr. Norton, veterinarian of Arizona, has been inspecting stock near Yuma. The horses in the camps of contractors are all said to be free from contagious diseases.

Outfits Like This Made Millions For Farmers Last Year

I H C irrigation outfits mean the difference between a partial crop and a full crop.

Results from the many I H C outfits already installed prove this.

After carefully selecting the seed and tilling the ground thoroughly, why leave the result to chance? Why not know that your crop will receive the right amount of water at the right time?

Now is the time to prepare for a bumper harvest next year. Take the first step by securing one of the famous

I H C Gasoline Engines

It makes you independent of local rainfall by giving you your own water supply system. It pumps all the water you want, just when your crops need it, from streams, lakes, rivers, or wells—economically, steadily, and easily. It is simple, dependable, strong, and durable.

I H C Engines also do all other kinds of farm work, and there is a style and size for every man's needs.

Vertical—2, 3, 25, and 35-H. P.; horizontal—1 to 50-H. P.; semi-portable—1 to 8 H. P.; portable—1 to 25 H. P.; traction—12 to 45-H. P.; sawing, pumping, spraying, and grinding outfits, etc. Built to operate on gas, gasoline, kerosene, distillate, or alcohol—air-cooled or water-cooled. See the I H C local dealer, or, write nearest branch house today for our new special irrigation engine catalogue and all information.

I H C Service Bureau

The Bureau is a clearing house for agricultural data. It aims to learn the best ways of doing things on the farm, and then distribute the information. Your individual experience may help others. Send your problems to the I H C Service Bureau.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

CORN.

By Mrs. M. E. Sherman.

Corn in California usually means Egyptian, kaffir, milo maize, and not Indian corn. We have the idea that Indian corn has no interest for us as a crop. The alfalfa field has crowded the corn field until we are not growing as much Indian corn as we did a few years ago. The labor troubles have something to do with this, as when we once put a field into alfalfa it is done with for some years. The corn must be sown each season; it must be cultivated several times and then when harvested the process has to be repeated the next season. The lack of silos has also had something to do with this dropping off of corn growing. The cows are not educated to exist on corn stalks, and usually will not eat them at all, only daintily picking the tender leaves and leaving the rest.

Statistics.

The Bible says, "Consider the flowers of the field." The corn plant is one of these flowers that our government considers worth spending much time on in gathering the statistics of yields in the different states. It seems only "dry as dust" people read these over or the question would not be asked again and again, will corn grow in California? Yes! It will and does. Have you any idea how much or how valuable a crop it is? The average of the corn crop from the years 1902 to 1906 in this state was 1,795,668 bushels with an average acre yield of 29.72 bushels. This yield brings California well up in the corn belt sisterhood. The highest yield per acre is shown by Connecticut with thirty-six bushels. Now some of the corn states do not do as well as California. Missouri with a crop of over two hundred million bushels produces an acre yield of 27.98. Kansas with yield of 183 million bushels has an acre crop of 22.08. Texas with 123 millions of bushels gives the farmer returns of 19.03 bushels to each acre. Then why should we not grow corn to balance the protein of the alfalfa?

Reasons.

The principal one is the varying yield from the mixed seed. The need is for corn that will produce good ears and good green fodder. I have seen some of the best of corn growing in the Kings River bottom lands, yet this seed is very imperfect, many ears having no grain at the time. We need to develop some corn for our conditions. It is a great need and a little work will make corn as good a crop in the way of profits as any we can grow. I hope the time will come when the corn field will be as important to us as the alfalfa field is today. I love the alfalfa fields with their soft lavender blooms and cool moist breath on a warm day. I also love the stately corn field with its soldierly rows of corn, bearing ears as arms. The very breath of the corn field is heat and it gives off a breath that is mellow and warm to the passerby.

History.

The corn plant is properly called maize or botanically Zea. The first introduction into Europe came when Columbus carried the seed to Spain from Hayti. It was at first called mahiz and then this was afterwards softened into maize. So long has corn been used as food for the human family that all its early history has disappeared and we only know it as a cultivated plant. In Mexico the teosenthe was long thought to be the parent plant, but now it is regarded as merely a closely allied plant that readily crosses with maize or zea. The botanist finds maize an exceeding variable plant, yet it is classed as a monotype order of plants, with zea as its only variety. Among the agricultural forms of zea or Indian corn are Zea Tunicata or pod corn, that is not of much value in present form except in warm countries were it is used for fodder plant.

Familiar Forms.

Zea everta, is the formal title of a dear old friend, "pop corn." Little but mighty are the power of its grains for Christmas happiness for the children. Fresh popped corn is as beautiful as fresh snow, full of deilcate flavor and a fragrance that makes one hungry to even think of it. My memory of a city child fast fills with thoughts of the long ago. The scent of the holly and crushed greenery from the distant woods mingles with the fragrance of hot pop corn. The noises and crowds of happy people shopping for Christmas all are coming back and I can see the street growing dim before the gas lamps are lit to shed a faint light on the crushed snow. I wonder! I wonder if pop corn will ever again smell and taste as ambrosial as it did in the days when we thought no one in the world was any older than ourselves.

Flints and Dents.

The two varieties of corn most cultivated are the flint and dent. The flint corn, Zea undurata, grows farther north than most of the varieties. It was recognized by Cartier in 1538 as a distinct form. It has the starchy matter laid around the germ in such a way that it dries without any pitting. Dent corn, or Zea Indentura, carries its starchy matter at the tip of the kernels and when it dries it makes a dent. Dent corn was found first as a cultivated plant, having been developed by the Powhatan Indians. It is a corn that grows farther south than the flint forms and does not do as well as far north as they are successfully grown. Dent corn does better in this region than flint corn and is the one generally grown. It is the variety we should take up in pedigree work.

Other Corns.

Another corn that differs greatly from the two last by having no reserved food stored in the kernel is the soft corn, Zea Amylacea, this is of great antiquity and seed precisely the same as it looks today are unearthed from the earthen jars that contain the mummified remains of the early inhabitants of Chili and Peru. Then another old friend, that is not always as good in California as it should be, is the Zea Saccharata or sweet corn of the vegetable garden. This is a smaller growing plant and the kernels of seed are semi-transparent when dried. The Susquehanna Indians were the first to develop this form of corn and the early settlers were suppiled by General Sullivan with the seed when he returned from the expedition to subdue the Six Nations in 1779.

Giant Grass.

After all what is corn? Merely a giant grass and an annual plant that must be sown every year. Did you ever think of the self sacrifice in times of famine that made these primitive people guard this seed? When they migrated they carried it with them. We owe so much to the heroes of the past, the heroes of everyday life! The corn plant is a big grass belonging to the order Grammae. Its growth is like other grasses from the heart outwardly, the blades unfolding from the rising stalks at each node. The corn plant is typical of human beings, as it grows from the center like the character of man unfolding from the experiences of life. It grows through a childhood of tenderness up into the bloom of adolescence, carrying high its tassel-crowned head. Then comes the finished life work, the golden ears of corn, the leaves like human life, fades away into silence and dust. "As for man, his days are as grass: as a flower of the field so he flourisheth. For the wind passeth over it and it is gone."—M. E. Sherman.

DEHORNING GOATS.

By B. A. R. Stocker.

In the Cultivator of October 26 I notice a query about dehorning goats. A she-goat has a far more sensitive nervous system than a cow, and the dehorning is likely to give her a terrible shock, the effects of which will last a long time. An old goat may never recover her confidence in mankind.

I have had the horns taken off some young goats by men who were expert at dehorning cows, and each said that it was quite a different proposition and much worse. Peroxide of hydrogen dropped on the stump is good to stop bleeding or other trouble. Two of these goats had been cauterized in infancy, but it was not a success, and the horn grew crooked, turning back into the forehead, when, of course, it had to be cut off.

I hope your correspondent will report later if he dehorns his goats. Perhaps a "diamond dehorner" would make a better job.

We are all novices as yet. By all means let us dehorn all kids at birth. My best success so far has been achieved with caustic potash in one operation at seven hours old. The point is to wet the hornbuds rather than the caustic. A kid develops so much quicker than a calf that it is best to take it a few hours from birth. The bud is then soft, small and easily destroyed. Also the kid keeps very still, and when it tries to scratch the place it can't reach it. It will yap more or less for perhaps an hour, but after the next good sleep it is all forgotten. It may be necessary to repeat the operation next day.

One fancier uses a four-inch reading lens and the noonday sun. But if the day is not bright I would go ahead with the caustic.

FEEDING MOLASSES.

The feeding of beet pulp, sugar beet tops, sugar beet syrup, and alfalfa, has become an important industry in the Yellowstone Valley, and the largest single stock feeding outfit in the state is at the local sugar factory, handled by Charles O'Donnell, David Fratt and Frank O'Donnell. They are fattening 4000 cattle and 20,000 sheep. The feed lots cover nearly 160 acres.

Immense quantities of alfalfa and straw feed are used in connection with the beet pulp. Alfalfa is also ground and mixed with the beet syrup

Get 2 to 6 Lbs. More Milk per Cow a Day

From the Alfalfa You Feed

Alfalfa is a good milk producer—but you can feed it so as to get 2 to 6 pounds more milk per cow a day.

Your cows like it—but it can be made still more palatable. It is a healthful feed—but it can be fed so as to insure your cows being and keeping in absolute health.

Alfalfa fed with Steam Dried Beet Pulp will make every one of your cows earn $10 to $20 more a year. Multiply these figures by the number of cows you own and you can safely count the result as your increased profits.

Alfalfa is an unrivalled feed for the dairy cow—but it should not be used alone. Cows need variety. They are human to that extent. Alfalfa supplies the important element of protein, but, fed alone, it is lacking in carbohydrates—an equal need in a milk producing ration.

STEAM-DRIED BEET PULP
Just Like Roots
Makes More Milk

Steam Dried Beet Pulp is the ideal combination with Alfalfa. Used in the proportion of 8 lbs. to 15 or 20 lbs. of Alfalfa Hay—all the Alfalfa a cow will eat—gives a ration almost perfectly balanced. It is light, bulky, succulent, easily digested, absorbs water quickly and swells to about six times its original bulk. It is cheaper than bran or rolled barley, and it is a greater milk producer. Steam Dried Beet Pulp is the clean beets dried by steam as soon as the sugar factories have extracted the sugar. Be sure you get Steam Dried. It is uniform in quality and color, never burned or blackened by smoke, always clean and pure. Keeps indefinitely. For convenience in handling, it is packed in 100 lb. sacks.

Steam Dried Beet Pulp is also a splendid food for horses, pigs and poultry, and raisers are placing more and more dependence upon it as a feed for their choicest stock. Steam Dried Beet Pulp is rapidly becoming a staple product among feed dealers. If yours does not handle it, write us direct. We will see that you are supplied.

J. H. Hale, the "Peach King," writes: "THE DOUBLE ACTION 'CUTAWAY' is a splendid tool. I use it in polishing off my peach orchards several times a year. A good pair of horses handle it all right."

The genuine "CUTAWAY" tools are used and endorsed by successful orchardists from coast to coast and bay to gulf.

In orchard work the driver can cultivate under the trees and below the low limbs, the horses not interfering with the branches. The double levers give the driver full control of tool at all times. For regular farm work the gangs can be drawn together.

CUTAWAY DOUBLE ACTION ORCHARD HARROW

Every orchardist and fruit grower should have one or more of these labor savers and fruit makers. They will positively pay for themselves in one season. To investigate is to be convinced.

Thorough cultivation makes large crops. Stirring the soil lets in the air, sunshine and new life, and kills foul vegetation. The "CUTAWAY" disk slices, stirs, lifts, twists and aerates the soil. CLARK'S "CUTAWAY" TOOLS run lighter and do better work than any other machine. Lasts a lifetime.

Send today for new catalog, "*Intensive Cultivation.*" Of course, it's free.

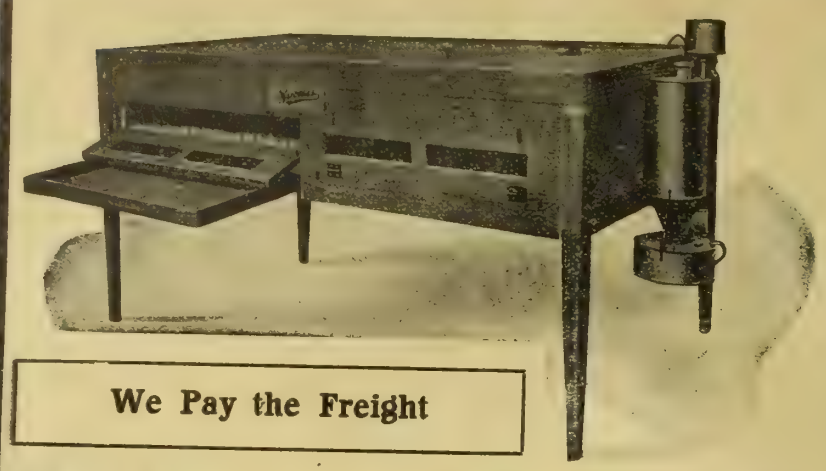
"SUCCESS" INCUBATORS



We Pay the Freight

Buy from me at wholesale prices

INVESTIGATION is all I ask

Which would you rather do, buy from a company that sells through agents and tacks on 25% to the real value of the Incubator or buy from me at first cost? Any company that sells through an agent has to give them 25% to 35% of the price, or they would not sell the goods; that is plain. I do not sell through agents. I keep no books, sell to no one on credit, have no losses for you to have to stand a part. I sell to you at wholesale. My price list proves it. I sell a hot water, three-pipe system machine, double walls, double top, slatted egg trays, compound heater, complete with removable nursery drawers, stained mahogany color with three coats shellac, and then pay the freight on the machines. I can do it and still make a profit. I own my own buildings, pay no rent, use no high-priced, useless office help, and everybody works. If you are with me, get my free book today, 48 pages. It tells the story. Our 64-page Pioneer Hatchery book tells the story of the largest baby chick concern in the world. It's worth while. Send your name to me today.

60 Egg size, $9.00

130 Egg size, $14.00

360 Egg Size, $25.00

612 Egg Size, $40.00

WE PAY THE FREIGHT

EXPERIENCE

I can show you quick where we get it, when you get my book. My business doubles year after year, because I make good Incubators and sell at the right price.

We hatch 100,000 eggs every 21 days

My heaters cost MORE—

Than any other hot water heater used on any Incubator whatsoever. It has three pipes, hot water goes around the outside of the case first and returns through the central pipe. The copper boiler on the 612-egg size is 10 inches long; no other is made that long, and three pipes cost more than two. No hot air Incubator on earth will run as even as a first-lass hot water Incubator.

Everybody Knows

THAT EVEN HEAT and the RIGHT amount of warmed fresh air is what hatches eggs. This can be had in a "SUCCESS" Incubator just the same as in any other well-made redwood case labeled Incubator. Don't think because some companies use a pretty label and a big price that you will get any more value than in the "SUCCESS" Incubator which I sell at these very low prices.

JUBILEE INCUBATOR CO., Sunnyvale, Santa Clara Co., Cal

to make a balanced ration for both sheep and cattle. All of this stock is being brought to a high finish and finds a ready market, mostly on the West or Pacific Coast.

The shipment of cattle and sheep from Eastern Montana to western markets has assumed large proportions.

One of the features of the feed lots this winter is a short horn steer from off the range which weighs 2150 pounds, and which they expect to bring up to 2500 by spring.

In addition to the cattle and sheep at the sugar factory, there are about 5000 cattle and 50,000 sheep on alfalfa in the valley, while many more are expected in before winter comes. Among the larger feeders are Hesper farm with 8000 sheep; Rea Bros., with 9000 sheep; J. B. Long with 6000 sheep; and O. B. Parham, Ed Cardwell, Joe Mason, C. L. Wilcox, John Miller, Tom Moore, Frank Sanderson and others feeding sheep, while Arthur O'Donnell, Tom Ronan, M. C. Cramer, Joe Zimmerman, Wm. Birely, Frank Johnson, Jim Miller, Frank Summers, and Jim Fraser are feeding cattle.—A. Gerharz.

BACTERIAL CONTAMINATION OF MILK.

The bacteria, seeded so numerously in our market milk, come from widely different sources. It is practically certain that milk as it is secreted by the healthy udder is sterile. However, it is difficult to draw sterile milk from the cow. In the case of a cow suffering from disease, such as tuberculosis or inflammation of the udder, the germs can pass directly from the cow into the milk. Bacteria, adhering to the mouth of the milk ducts, can make their way up into the teat for a short distance. Here they find rich food in the few drops of milk that remain, and the warmth of the teat causes their rapid increase.

One of the chief sources of contamination is from the cow herself. The coat of the cow, even kept under good conditions, offers the best of facilities for harboring dust and dirt. All of this filth is laden with bacteria in immense numbers. In the switching of the tail, the movement of the flanks, the rubbing of the skin by the milker, there is a constant shower of bacteria into the pail.

What is true of the cow is also true of the person of the milker. Clothed in the dust-laden garments of daily use, he carries innumerable bacteria, many of which are dislodged and fall into the milk. It is not so much the number from this source as it is their liability of being disease producers that is important.

The air is another source of contamination. The movements of men and animals in the stables cause a good deal of dust to rise and settle in the exposed milk. The presence of dust is always accompanied by large numbers of bacteria, especially of the putrefactive and spore-producing kind.

Probably the most prolific source of milk contamination, as far as numbers are concerned, is the milk utensils. As the milk passes from one utensil to another it gathers more and more bacteria. Pails and other utensils are usually washed with hot water and soap. But after ordinary washing there will be left clinging to such utensils many bacteria which are ready to develop as soon as fresh milk is added to furnish proper food and conditions. Undoubtedly most of these bacteria are lactic acid producers and, although harmless, will cause an early souring of the milk.

These various contaminating factors can be largely lessened or completely eliminated. The most of the bacteria from the fore milk can be thrown out by rejecting the first few streams. Dust in the air can be reduced by exercising care as to the time of feeding and bedding. The number of germs from the animal and the milker can be reduced by cleaning and moistening the udder and the flanks of the animal, by using a pail with a small opening, and by requiring the milker to wash his hands and use clean clothes. The use of steam or scalding water in washing the dairy utensils will entirely exclude the germs from this source.—G. A. Gilbert, Colorado Agricultural College.

AMERICAN DAIRY INSTITUTE.

One of the most important educational conventions held in connection with the National Dairy Show, Chicago, was the American Dairy Institute. This meeting was important in that a number of matters regarding the growing of alfalfa, and its relation to the fertility of the soil, was brought out by Dr. Cyril G. Hopkins, professor of agronomy, University of Illinois, who is one of the best known authorities in the country.

The matter which is not of common knowledge was brought out in the statement made by Dr. Hopkins, that it is a mistaken idea that alfalfa enriches the soil. Large yields require a great amount of fertility and will impoverish the soil very rapidly unless fed to live stock and returned to the soil. The idea that alfalfa enriches the soil probably comes from the fact that in many instances the soils have been growing large crops for many years and the crops following alfalfa do better than those following non-leguminous crops. This is due to the fact that alfalfa extends its roots many feet into the ground, utilizing the fertility not reached by the roots of other plants, and putting the soil in good physical condition.

NUBIAN GOATS.

By B. A. R. Stocker.

Referring to the interesting article of Nov. 2nd concerning the Nubian and Anglo Nubian goats, the particulars given in my short letter on this subject on Sept. 28th were taken from Bulletin 68, pp. 66-69, and Holmes Pegler's Goat Keeping for Amateurs. As to what this infusion will do in California we shall not begin to know for several years. The goat that "dropped eleven kids in one year" was a Nubian. But the next writer regards this as "the exception rather than the rule." Let us hope so! These stories are French; not "California stories" yet.

KEEP IT HANDY

You can never tell when a horse is going to develop a Curb, Splint, Spavin, Ringbone or a lameness. Yet it is bound to happen sooner or later. And you can't afford to keep him in the barn. Keep a bottle of

Kendall's Spavin Cure

handy at all times. Mr. Sheppard of Richfield, N. J. writes "Your Spavin Cure is a sure cure for Spavin, Splints, Ringbone, Lameness, etc.

Profit in the Poultry Yard

Practical poultry people who may have ideas from their experience as to methods of feeding and housing and general care of poultry will confer a favor upon the Cultivator and its circle of readers by sending in concise accounts. Mrs. Basley is always willing to answer queries, which with the experience of others should make this a most valuable feature in poultry life on the Coast. Opinions or matters of a personal nature should be omitted, but a concise statement of facts is always valuable.

QUALITIES OF THE RHODE ISLAND RED.

By A. G. Goodacre.

So much is written now-a-days about the qualities of a breed, that most of it reads like a copy off the other fellow's slate. The purpose of this article is not to deal with the fancy side of the business but to review the many good qualities of a strictly commercial breed. We have bred the Rhode Island Red for a good many years, taking up the Rose Comb Reds first while living in Canada, twelve or fourteen years ago. We had the old, original blood, that is to say, in those days they bred all three combs, rose, single and pea, from one mating; also there was quite a tendency to throw games and Leghorn types.

There are generally striking features to most breeds of fowls to distinguish them, some leading characteristic. Fortunately, with the Reds these have been moulded upon sensible, economic lines. Take for instance their moderately fine bone and great length of keel. This latter is an essential. The short Wyandotte backs are discarded. The Rhode Island Red is a long fowl, carries its tail comparatively low, gives a well-fleshed carcass of fine appearance and first-class quality, not indulging in the coarseness of fiber of some of the other American breeds.

I think it can rightly be said they have always held their own in the eastern markets, having been largely "manufactured" to cater to the New England taste, having their origin in Rhode Island and Massachusetts. I have seen large quantities in the markets around New York and a great many are shipped in from around Philadelphia just the size and catchy class to them that make quick sellers in the market, and so we all know, that which sells quickly is satisfactory to the producer and retailer alike. Another reason why they sell well is their medium size, and we found on carefully analyzing them that the relative amount of edible parts to offal when cooked, cooled, separated and weighed, is large compared with many fowls. They don't have big, coarse heads and necks, nor large abdomen; the bone is comparatively fine.

How about eggs? Why, the Reds are on top again. Yes, they shell them out summer and winter. Again we go back to their ancestry and find one of their chief requisites, the production of eggs in all kinds of weather, on a very bleak coast. This breed lays a brown or tinted egg, deemed a desirable quality in the New England markets. Some strains lay darker eggs and some larger eggs than others. The hatchability of these eggs is splendid, often in excess of Leghorns. That is one reason why we have tied up so strongly to the breed. Their origin from outcrosses, the game blood used and their activity, are probably responsible for this important feature in this breed. But how many eggs do they lay a year, you ask? Well, Mr. Hogan walked into our yards one day and estimated several at 220 or better. We really think individuals can be found in most flocks averaging 200 eggs per year, but a safe estimate would be from 160 to 180 eggs per hen in a carefully bred flock. We have no records.

We consider the Reds first-class layers for two seasons. My experience with White Wyandottes of over the two-hundred-egg mark was anything but encouraging, as the progeny bred from these high-capacity trap-nested hens totally lacked vitality. Friends, it is so easy to run out a breed that it may be well to sound a note of warning just here.

I have noted in this variety quite a tendency to produce small early laying pullets and where this is encouraged by hatching from pullets eggs, soon the flock deteriorates and the eggs are of smaller size. To offset this some people put into their flocks extra large males, but the correct way is to select a pen of yearling and two-year-old hens of undoubted good laying qualities, weighing when in good condition about seven pounds and mate them to a vigorous yearling cock well around the standard weight for an adult bird of 8½ pounds; the weight for cockerels is 7½ pounds, for hens 6½, and for pullets an even 5 pounds, and we don't believe in breeding them over these weights; that is encroaching on the Plymouth Rock and Orpington classes. Wise heads have placed these weights to fit the breed.

The Red is an economic feeder and this is very important too; they are not nearly so apt to lay on superfluous fat as the other American varieties. They are an ideal fowl for confinement on the city lot, and as setters and mothers have no superior, not being too heavy and lazy so as to crush the eggs and chicks. We break up our brooders in a separate pen in five days. We mate twelve to fifteen hens to a male, but I might here say that the best lot of eggs we ever incubated was from a flock of some 110 hens mated to eight males in a run some 50 feet by 200 feet long. The fertility stood steady right through the season at 94 per cent. The Rhode Island Red is in every sense the rancher's fowl; it is a great success on the small city lot; it is at home and a producer in the hot spots on our map.

COULSON'S POULTRY FOOD MADE IN PETALUMA

SUCCESS IS THE GOAL

Whatever you do, you hope for success. There is but one way to attain it, and that is TO BUILD FOR IT.

This applies to poultry raising the same as everything else. If you build for success you will attain it.

COULSON'S CHICK FOOD
is the foundation upon which the chicks can build strong bodies and great egg capacity. It is made from clean and wholesome grain, seeds, meat meal and other ingredients which are material to the well being of chicks. It has been tried and found right. Those who have used it know they can raise more chicks than with any other food. If you have not used it in previous years, just try it this season and note the results.

COULSON'S EGG FOOD
gives the hens a chance to build eggs. With its use the egg machinery can do more and better work than with any other preparation said to be "just as good." It is STANDARD—recognized as such by all successful poultrymen. They have built their success upon this foundation and will have no other egg food. If you are willing to build from the same material your success will be equally certain.

Our new book, "Poultry Feeding for Profit" will be found of great value. We will mail you a copy FREE. Just send your name and address.

Our foods are for sale by all reliable poultry supply houses.

FALL CHICKENS.

By Mrs. J. R. King.

As the wise old poultry keeper said: Any time you can raise a chick is the best time for hatching!

However, I like to see our biddies bringing in the fall hatches, for, on our ranch no chickens are raised with so little trouble or expense as the fall chickens. Late hatched chickens are in full laying the next summer when the price of eggs begins to ascend. If they be well fed, their moulting period at one year will be short and light, interfering but little with their laying.

Our chickens range freely in orchard, vineyard and alfalfa. The fall chicks therefore have a full harvest of seeds and bugs ready for their reaping. Up to the time the cockerels are ready for the Thanksgiving or Christmas market, their feed costs us almost nothing. By the time the price of feed begins to go up in the spring, the pullets are beginning to lay enough to pay their own way.

Of course, fertility runs very low in the late summer and autumn, and I have never had what I considered paying hatches in incubator lots. Right here is where nature and the broody hen can double discount all our science and knowledge of artificial incubation.

The biddy that steals her nest out under a grapevine, or in the weeds, comes in usually with a full hatch. She knows the reason for the faith within her when she slips away and hides her nest far from the cackling crowd. Her eggs are fertile! But the eggs I pick up from random hens that haven't a ghost of a notion to set, those eggs turn out a bad lot!

So in mid-summer and later, when I see a hen that since early spring has been faithfully contributing to my egg basket, when I see her sneaking away under the undergrowth on our ranch, I thankfully let her sneak. She's earned her rest and right to maternity. It pays not to inquire too persistently into her private affairs. The chicks she will bring in are worth much more than her eggs, maybe already a trifle stale, or addled.

Then when those little chirping, fluffy balls of chicks come in the first time led by their solicitous mother, how she will fight you off and ward them with her widely spreading, trailing wings! If you ever expect to lay hands on them, now is the accepted time. Let them go but a few days and you might as well try to catch a covey of wild quails.

It is no small task to capture a Leghorn hen and her brood just in from the jungle. It takes the whole family and many strategies. We pick up the helpless little ones and put them in an open box, a trifle too deep for them to jump out. Here we leave them, until the mother, distracted between anxiety for her imprisoned babies and natural fear of a trap, finally conquers her fears, and she flutters into the trap and hovers her young. I slide another box over the first, and those chicks are mine to put into a coop, to be fed properly and protected for a week or more till the hen becomes attached to her new quarters.

As soon as caught, I dust the hen with dry sulphur. Also, I put a touch of grease on the head, under the wings, and under the chin of each little chick as a warning to mites and lice. If I fear an outbreak of chicken pox, it is easy to spray hen, chicks, coop and all, on some warm morning with a sheep dip solution. It need hardly be said that at all times the coop must be kept clean.

CALIFORNIA POULTRY SHOWS.

Santa Ana, Dec. 27-30. Orange County Poultry, Pigeon and Pet Stock Association. S. J. Jackman, President.

Napa.—Jan. 4-6, 1912. Napa County Poultry Association. Wallace-Rutherford, secretary.

Los Angeles.—January 4-10, 1912. Joseph E. Davis, Secretary, R. D. 1, Box 48, Los Angeles.

San Diego. — January 12-18, 1912. The Fanciers Club of San Diego. V. Davis, Secretary.

This is one busy woman's method of keeping up her flock. On our ranch, where chicken raising is only one of many activities, I am glad enough to get these gratuitous fall chicks. For several years I have raised in this fashion a hundred or more fine pullets each autumn.

COLD STORAGE.

One of the most important factors in the marketing of poultry products in recent years is cold storage, says H. W. J. in the National Stockman and Farmer. It is doubtful if any one thing has done as much for the prosperity of the poultrymen. It makes a market for his product at flush times when otherwise prices would drop to ruinous levels, and, contrary to the rule in general storage, this held-over product scarcely has any influence on the market price of fresh eggs in winter. I have just read an article by a defender of cold storage who claims that while storage does raise the level of prices at times of flush production "so that it is possible for the farmer to realize an adequate return on his labor and equipment, it keeps prices down during periods of natural scarcity." The time may come when the production of winter eggs, for example, may so nearly approach supplying the needs of the market that storage stocks will have that effect, and we shall not then be so friendly to storage, perhaps. At present, however, the supply of strictly fresh eggs is so far from satisfying the demand of the market that the competition of storage eggs is scarcely felt by the winter egg producer. Market quotations each winter setting a new mark in high prices for fresh eggs is proof enough on that point.

There is no question about the fact that storage does greatly affect the price of spring and summer eggs. These begin to go into storage before the price reaches 20 cents, and when it reaches 18 cents a dozen the storage operators stand ready to take everything that is offered. It is practically impossible for eggs to go below 15 cents under present conditions. And cold storage did it. But storage does not keep egg prices down in winter, for the simple reason that there is a great gulf fixed between strictly fresh eggs and the very best that the storage man can do for his stock, and we have not seen and are not likely soon to see the time when there will be enough fresh eggs in winter to supply the demand. Storage does give to the general egg-consuming public fairly good eggs (speaking now in broad, general terms) at a price which it can afford to pay and at a time when otherwise it would not be able to have eggs at all, and that's a good deal. Instead, however, of keeping prices up in the summer and reducing them in the winter the actual effect is to raise the average price for the year decidedly above what it otherwise would be. Hence it is hard to see how the poultryman can allow himself to join in the hue and cry against cold storage which is agitating a part of the public at this time.

Lee's Egg Maker

Are your hens laying *now?* If not, are you doing your part in furnishing proper feed. Protein—*digestible* protein—is the feeding secret. It's a simple matter to get food rich in protein, but the percentage of it that is *digestible* is the thing to consider. Lee's Egg Maker is almost a pure meat product, clean, sweet, and wholesome, and contains more protein in *digestible* form than any other meat product. Successfully replaces all other kinds of meat food at *less* feeding cost and better results. That's our *guarantee.*

Prices 25c to $7.00, according to size.

GERMOZONE

is the best health-insurance you can furnish your fowls. Indispensable as a remedy for *Roup, Colds, Chicken-Pox,* and other poultry ailments. Disease in your flock now will probably mean diseased birds all winter and poor breeders in the spring. Germozone twice-a-week tones and builds up the system, destroys disease germs, insures better and healthier stock *now* and strong, vigorous birds for the breeding season. Best guarantee *against* disease; surest remedy if disease has already taken hold. *Either tablet or liquid. Price 50c.*

Lee's goods are on sale in almost *every* town, but if yours is an exception send your order direct to us and ask for our *free* offer.

GEO. H. LEE CO.,
225 W. 2d St., Los Angeles, Cal.

Send for your *free* copy of Lee's New Poultry Book. Interesting; instructive. The "best yet."

HENRY LANGENSCHWADT
Meridian Road SAN JOSE, CAL.

Farmers at Jerome, Idaho, have been promised a sugar factory if they will guarantee sufficient acreage.

DIRTY EGGS ON THE FARM.

While there are a few egg producers who take the best of care of their product, the average farmer considers the eggs produced on the farm a by-product and makes very little provision for their care, aside from gathering them. A large loss is caused by dirty eggs, the number being enormous, and according to the estimate of Secretary Wilson of the Department of Agriculture this money loss to the farmers in the United States amounting to about $5,000,000 annually.

This loss is very largely brought about by not gathering the eggs often enough. In wet weather more dirty eggs are found than at any other time. This is caused by the fact that the hen's feet are often covered with mud or other filth, and in going on the nest to lay she soils the eggs already in the nest.

An insufficient number of nests is often the cause of many of the dirty eggs found. Eggs are laid on the ground and around the hay and straw stacks, and becoming stained, are classed as "dirties." Again, when too many eggs are allowed to remain in a nest some are broken and many of the others become smeared with broken yolks. This condition is often brought about by allowing the broody hens to use the same nests with the layers. On a farm where one nest to every four hens is provided and the nests are kept clean and well bedded, it is found that very few dirty eggs are produced.

After gathering the eggs, care should be taken not to put them where they will become heated, or near oil, onions, or other vegetables, as they readily absorb odors.

Although dirty eggs may be perfectly fresh, they invariably sell as "seconds," and when but a few dirty eggs are mixed with an otherwise fresh, clean lot, they materially decrease the price of the clean eggs.

SCRATCHING SHED.

Sometimes one can save a lot of poultry loss and worry by seeing after very small matters connected with the poultry. For instance, chickens take cold more easily from damp and rain than they do from extremely cold weather. Chickens hate wind, and a wind of good velocity will send them under shelter, but not so rain. Into this they will venture, and after a day's rain they go on the roost wet and draggled, and, after a few such wettings, come off the roost sniffling, and with a quirk in their throats. Then let roup germs come along and that flock is fixed for loss in more ways than by death, as a roup-infected flock is a poor flock to breed from. Every poultry house should be so made as to allow the flock to be shut in on very stormy days. I know that its' a nuisance sometimes to be forced to do this. You know that at the lowest market price every moderate sized hen is at least worth a 50-cent piece. This is why I advocate a scratching shed, though it be but 8x12 feet, adjoined to the farmer's chicken house. You can shut the chickens in this, give them something to scratch for and save them from the chilly rains of spring and fall.

Always fatten all kinds of poultry before selling. The fat bird not only weighs more, but brings a better price because it is fat. From a week to ten days before marketing confine the birds in coops or pens and feed them all the grain and soft feeds they will consume. Supply grit and water for digestion.

It's the
Laying Hen
That makes Poultry Raising Profitable

There are certain Food Elements that are absolutely necessary to keep your hens healthy and productive. If a hen does not have the proper food and nourishment she cannot be expected to produce eggs

Successful Poultrymen use and recommend our Superior Foods

They find that the Poultry Foods **we manufacture** and sell are as important to their success as the chickens themselves, because a hen that won't lay is a useless expense.

Our Superior Poultry Foods include

Pure Blood Meal — Pure Meat Meal
Beef Blood and Bone — Ground Fresh Bone
Cracklings — Limo Grit
Animal and Willow Charcoal
Granulated Oyster Shells
X-Ray Meat Scraps

GEESE

White Embden Geese—Always healthy, easily raised, best for feathers and flesh, $3 each. Both phones. Leslie F. Gay, East Los Angeles.

FARM LANDS FOR SALE.

A Rare Chance—
Ancient lake bottom, 50 feet above Sacramento river bottom, black loam, no alkali; perfect drainage, primeval oak forest, land first class for pears, prunes, peaches, berries, onions, potatoes and hops. Schoolhouse, postoffice and express office being established on the ranch. Three miles to high school. Six local trains daily. Northern Electric road survey from Woodland to Colusa and Red Bluff runs through center of ranch.
Also ridge land of red gravelly loam. Bearing orange and lemon trees on adjoining land. Oranges ripe and well colored for Thanksgiving trade. Large percentage of fruit runs fancy. Abundant water for both classes of land. Electricity one cent per kilowatt hour. Irrigation equipment goes with the land. 10 acres and up on exceptionally low terms. S. P. R.R. Co. named their station on this ranch "Richfield." It is well named.
Orchards of none-resident owners planted and cared for by J. W. Mills, former superintendent of the Riverside Citrus Experiment Station. Address J. W. Mills, Box 431, Corning, Cal.

WILL YOU BUY A HOME
In one of the best colony districts of the State? We have sold many 20-acre tracts in the last three weeks to people who have inspected the land, and they pronounce the land first class and the conditions ideal.
There is plenty of water, creamery, cannery, churches, schools and packing houses.
Close to 4 Railroad Stations.
We want the right people and will make terms to suit, and, if desired, will accept part of crop each year after first cash payment until land is entirely paid for.
ORCHARD AND FARM LANDS COMPANY, 309-310 Stimson Bldg., Los Angeles.

For Sale—LINDSAY ORANGE LANDS.
Eleven days before Christmas the fourteen packing houses of Lindsay sent out pay checks for the 1910 navel orange crop. Lindsay orange district had the holiday orange market all to themselves, and of course they sold at good profit.
Why not invest in some of this Lindsay orange land and get the benefit of rapidly advancing prices?
Ten-acre tracts in Lindsay, $150 per acre, on easy terms.
Choice Tulare alfalfa lands, water in abundance; any size tracts, $50 per acre up.
KIOUS-WHANN REALTY CO.,
235 Mason Bldg., Los Angeles. A4164.

170 Acres—¼ mile from R.R. station and school, $30 per acre. 100 acres in crop; more can be planted to trees or vines. Partly warm citrus soil or for winter gardening; some alfalfa land; well 50 feet deep, 10 feet across, water 8 feet from surface; all under fence; no other improvements. Terms $3000 cash, balance at 7 per cent; will not trade. Address C. T. Haney, Escondido, Cal.

Choice Orange Land, Exeter District—63 acres, 3 miles south of the town of Exeter, California, three-quarters of a mile from Southern Pacific railroad station, right in the foothills, leveled, water developed on it. Write for particulars. The Phalanx Company, 513 Chamber of Commerce, Los Angeles, Cal.

For Sale—Mammoth Bronze turkeys, hens and toms; Eastern stock. Gobblers $10, hens $5, trio $18. Eggs for sale in season. Address John Carroll, Victorville, Cal.

Veterinary

Answers in this column by Fred G. Matthews, M. S., D. V. M., 1232 Central Ave., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Stifled.

What is meant by "stifled?" Is there a cure for the trouble?—Subscriber, Claremont.

A condition which obtains occasionally in the hind limb of horses and mules in which the limb is extended backwards and held rigidly in that position, because of the displacement of a small bone in the stifle joint is sometimes termed stifled by veterinarians. Stablemen, horse owners, etc., seem disposed to apply the term to any obscure lameness in the hind limb whether from a nail wound, sprain, strain, spavin, or other cause, and often heroic remedies are suggested as sure cures, such as forcing the animal to swim a deep stream, or to jump a fence. Still another foolish and dangerous remedy suggested is to tie one end of a long rope to the foot of the lame limb, secure the other end to a tree or post and drive the horse at full speed the length of the rope and thus subject the limb to a terrific jerk. Write again, describe the lameness, whether acute or chronic, and we will try to aid you in determining the cause and location.—F. G. M.

Many of our farmers are like the alchemists of old—they are ever searching for the miraculous seed—the means which without any further supply of nourishment to the soil, scarcely rich enough to be sprinkled with indigenous plants, shall produce crops of grain a hundred fold.—Liebig.

The State Farmers Union of Oregon held its last annual at Pendleton.

Agricultural Notes

Swedish sugar factories, whose men work from six to six o'clock, have found advantage in a two hour rest at noon.

Western Alberta farmers have found that section well adapted to sugar beet culture and are producing twelve tons of 17 per cent beets.

Germany is now making a test of a new draft animal in the American mule. They were first tried in the cities and are now being tested on the farms.

Japan has just established a new sugar manufacturers journal at Tokio. It is called Sugar Industrial World. It is printed in Japanese, with a few pages in English.

In Bohemia the beet sugar factories employ 18,000 men. At time of the recent harvest shortage of labor endangered a large proportion of the beets because of coming frost. Factories were closed and the laborers sent into the fields to gather the beets for the farmers.

India's cotton crop for the last season was reported to be under the ordinary, but in some sections up to the average.

Russia's cotton crop was greatly injured by early frosts.

Visitors at the recent Royal Agricultural Society Show at Melbourne, Australia, were pleased with fresh grapes kept in cold storage for several months.

Australia boasts that she will soon be one of the world's greatest fruit suppliers. Climate, soil and the world for the market combine in giving the antipodes certain advantage.

India is making rapid strides in date culture. Over 2,000 date palm suckers were recently imported into the Punjab district.

The value of sugar beet seed exported to the United States from Warsaw, Poland, increased from $9,000 in 1908 to $27,000 in 1910. The seed was chiefly shipped to California.

During 1910 Spain bought from Porto Rico 3,672,264 kilos of coffee. A kilo is 2.2046 pounds.

Owing to heavy late frosts, Chili will have a very short grape crop during the season which is now approaching. The growers who have any grapes are in clover, for they are being contracted for at $4 per hundred pounds.

Chili has been suffering from a severe drought, and livestock will suffer greatly where irrigation is not practiced.

Apple culture in New Brunswick has received great interest through the apple show recently held at St. Johns. The quality of the fruit exhibited is said to have been a revelation to all who attended. The coloring of these apples was wonderful, the favorite varieties being McIntosh Red, Fameuse, Dudley Winter, Wealthy, Wolfe River, Alexander, Golden Russet, King of Tompkins, Ben Davis, Gano, Gravenstein, Grimes Golden, Baldwin and many others.

Efforts are being made to produce a high grade of sugar from the nipa palm in the Philippines. Since history began, these palms have been the source of alcohol and intoxicating drinks for the Filipinos, but the Department of Agriculture believes there are great sugar possibilities in this particular plant. The natives are using this plant to its limit, it seems, already, for from its leaves are made shingles, hats, mats and bags, pails for dipping water, coarse baskets, brooms, thongs for tying rice bundles, fuel, "floating logs," and material for sewing shingles. From its fruit, food or sweetmeats, and, as noted above, from its sap a pure, wholesome drink while it is fresh, a fermented drink called tuba, alcohol and vinegar.

The greatest agricultural product of Manchuria is the soya bean.

An agricultural expert in Washington makes the following distinction between a farmer and a planter: A "farmer is one who first makes his living on the farm—he raises things which his family and stock may eat. In connection with these he raises some sort of "money crop," wheat, oats, corn, cotton or sugar cane. The "planter" raises a money crop, whether cane, cotton, wheat or oats, and out of the proceeds of these he purchases what his family and stock may need. He advocates that every planter be converted or transformed into a farmer.—Louisiana Planter.

At a pure food congress held in New York recently the discussions were peppered with a whole lot of questions as to why there was such a high price on sugar. Light was brought on the question of why there was always an advance in sugar prices during the canning season, but no one seemed to give any definite information on the question propounded.—Louisiana Planter.

The United States imported of sugar beet seed a total of 9,203,437 pounds, worth $604,920, in the fiscal year 1909, and 10,309,075 pounds, worth $668,446, in 1910. It is admitted free of duty. The seed is not grown in the United States. One farmer at Fairfax, Wash., who has been producing it in a limited way, states that he has now discontinued beet seed culture. The sugar beet is a biennial, requiring two seasons to develop the seed. It is understood that not only is the price higher this year for sugar beet seed, on account of the shortage in Europe, but that it will probably be still higher next year, as the small beets grown this season for the crop next year did not develop well. The Department of Agriculture finds that the imported beet seed is showing deterioration in recent years; hence it is highly desirable that the seed should be produced in the United States. The Bureau of Plant Industry is considering some experiments along this line next year in the Shenandoah Valley of Virginia.

PRACTICAL POINTS ON OLIVE CULTURE.

By G. D. Tofanelli.

Mr. G. D. Tofanelli of Fallbrook, San Diego County, has given the Cultivator same practical hints on olive growing in California. He himself has in the last few years brought a neglected olive grove into profitable bearing through applying his knowledge of fundamentals gained in his native land, Italy. He is now installing an olive mill to manufacture his own oil. He writes:

"The best varieties for oil are Rubra, Uvaria and Columbella; for pickles, Mission and Manzanillo.

"Olive trees do not like wet ground or lowlands, but do better on foothills. The ground must be loose and well drained, preferably decomposed granite, but all loose ground is good for them; no adobe, no hard or compact ground, no flooded ground.

"As to culture, the ground should be plowed deeply once a year, or better, twice, and cultivated once or twice a year. To keep in balance and good shape it is necessary to prune alternate years. It is very easy to keep olive trees in good condition with little expense and have good returns."

In the Cultivator of December 7th we quoted article from The Feather on scientific feeding for eggs. By mistake the last paragraph giving credit to The Feather, was left off. That paragraph was as follows:

"I will close this department by arranging the four following foods for November feeding:

Whole corn	114 lbs.
Whole wheat	36 lbs.
Beef scrap	22 lbs.
Mangel wurtzels	62 lbs

Ratio, 1:4.75. —The Feather."

The above should have been inserted in place of the last paragraph which was printed by mistake.

A GOOD PRESENT.

Be sure not to overlook the Cultivator in selecting your presents this year. You will find order blank on another page, which explains itself. On request we will notify the one to whom it is sent that the paper is a present and that it is to stop at expiration. Send in your order at once so as to get the subscription started with the next issue.

In addition we call attention of readers to the clubbing list of the Cultivator. It has not been given as often as we would have liked because of the crowded condition of the advertising columns, but there are but very few papers pubilshed in the country on which we would not be glad to give our subscribers the advantage of a lower clubbing rate. A very few refuse to enter into this proposition excepting for new subscribers, but a postcard to this office will secure information as to exact rates on any publication.

The Whiting Jersey Stock Farm Co.
Is making the very best strains of blood fresh from the Island of Jersey a specialty. Whiting Jersey Stock Farm Co., Heber, Cal.

CLIP YOUR HORSES Clipped horses work better, feel better, look better, and are worth more than unclipped horses. Clip off the thick, heavy coat that holds sweat and dirt. Clipped horses dry quickly, rest well and get more good from their food. They come out refreshed and look and work better.

KIRKMAN NURSERIES

WM. T. KIRKMAN JR.
MANAGER

MAIN OFFICE FRESNO, CAL.

Attention!

PLANTERS
NURSERYMEN

Now ready to deliver—positively the finest and cleanest stock of Deciduous Fruit Trees and Vines we have ever seen grown.

We have already booked orders for more than twenty carload lots to large planters and dealers. This season we have not lost a large buyer to whom we have had the pleasure of exhibiting our trees and vines.

We are digging about half a million trees; about half of these sold to date.

If you need a carload—or a dozen—of the best rooted and cleanest trees that care and right soil and moisture conditions can produce, it will pay you to call on us or send a list of what you will need, for our estimate.

We have to offer a very complete assortment of nearly all varieties of

Peaches Apricots Plums Pears
Apples Cherries Walnuts Figs

and other Fruit Trees; as well as all the standard GRAPE VINES; also several thousand ORANGE and LEMON Trees, and a large lot of EUCALYPTUS.

—ADDRESS—

Questions and Answers

THE EDITOR AND STAFF

Olives—Frost.

A valued subscriber at Earlimart calls attention to our statement in a recent Cultivator that many olives in the San Joaquin Valley have been injured by the cold weather of the last few weeks. While this is true, there are many sections of the valley in which olives are being gathered in best of condition. The Earlimart subscriber says that on December 11th as fine olives as one ever saw were being gathered and made into pickles. It is probable that nearly all sections of the San Joaquin Valley will produce olives satisfactorily nine years out of ten, and in addition there are other favored localities where a crop may be harvested every year.

Aphis.

I send cucumber leaf infested with little green bugs or lice. What are they and what can be done?—Subscriber, National City.

These are simply the ordinary plant lice or green aphis, which are enjoying the perpetual summer of San Diego County's coast section. Spraying the vines with kerosene emulsion, tobacco extract solution, or simply powdering with buhach will dispose of the present crop of the pest. We say the "present crop" because a few days later may see more of them returning, for they are a persistent pest. They weaken the productiveness of the plant by sapping its juices.

Papaya Seed.

Where can I secure seed of the papaya?—Subscriber, Sespe.

This plant does not produce well from the seed, but reproduction is usually through cultivation of the root system. Seedsmen and nurserymen advertising in the Cultivator can generally supply rooted plants of the papaya. We refer inquirer to article on citrus page of this issue, wherein the Department of Agriculture of the Philippines gives instructions as to producing from seed.

Oilve Seed.

Where may I secure olive seed? Would like 100 lbs.; also would like sweet and sour orange seed.—Subscriber, Lindsay.

Olive seed is not a commercial product because the olive is always produced through cuttings. We do not think this seed can be secured except by buying the olives. Sweet and sour orange seed can both be had by placing order with seedsmen advertising in the Cultivator.

Smut on Wheat and Barley.

Please give directions for using formaldehyde in treating wheat and barley for smut. Which is the best, formaldehyde or bluestone? How much bluestone should one use?—Subscriber, Grimes.

Use 1 lb. formaldehyde to 50 gallons of water. Sprinkle wheat, covering afterwards with cloths soaked in the solution, or better, immerse the sack of seed for 30 minutes in the solution.

The bluestone solution is made as follows: 10 lbs. bluestone to each 50 gallons water. Immerse the seed in this for 10 minutes, then drain and dry. The grain drill, also vessels in which seed may be carried, must all be treated with one of these solutions. The spores of the smut are persistent and liable to be in these vessels or vehicles if they have been used in handling grain before. As to which is the best of these, we are not certain, but the formalin is usually preferred.

Value of Manure.

What value per ton would you place on dry pulverized manure from cow corrals? Would you consider it of more value than fresh horse manure with some straw in it? How many tons per acre of dry cow manure would you apply to six-year-old apple trees?—Subscriber, Greenfield.

It is impossible to give the value of manure. Feed of animals, location and other factors vary greatly. For instance, in large cities animal owners usually pay to have manure removed. In the gardening section or far from manure production, a price in excess of its real fertility value is often paid. The richer the food of the animal in plant food constituents naturally brings the richer fertilizer. Animals fed upon grains and alfalfa, for instance, produce valuable manure. Those in pasture and running to the straw stack produce manure of lower value. Another factor is as to whether absorbents are used so as to preserve the liquids. Six-tenths of the fertilizer voided by farm animals is generally considered to be in the liquids. To give something of an idea that each one may figure his own values: In 100 lbs. of sugar beets there is 87 lbs. water, .22 lb. of nitrogen, .10 lb. of phosphoric acid, and .48 lb. of potash. In corn there is 10.9 lbs. of water, 1.82 lb. of nitrogen, .70 lb. of phosphoric acid and .51 lb. of potash. In cotton seed meal there are 6.70 lbs. of nitrogen, 2.47 lbs. phosphoric acid and 1.83 lbs. potash. If wheat straw is used it often contains in each ton 9.6 lbs. of nitrogen, 4.4 lbs. phosphoric acid and 16.4 lbs. potash. The action of dairy scrapings is much slower than that of horse stable manure where much litter is used. Or to express it in other words, horse manure is often spoken of as being "hotter." Dairy corral manure is excellent for a mulch.

Olive Cuttings.

What month is the best to plant olive cuttings in hotbed? Also if artificial heat is used, what temperature should be maintained?—Subscriber, Orland.

We refer our subscriber to article by Mr. J. W. Mills in Citrus and Tropical Fruit department of this issue.

DOMESTIC SUGAR.

Secretary Wilson, in his annual report for 1911, just issued, estimates the beet sugar crop of the Western states at 600,000 short tons, this exceeding any previous crop by fully 80,000 tons. He estimates the yield of domestic cane sugar at 380,000 short tons, or say some 350,000 long tons, which was a conservative estimate, made doubtless when the text of his report was written, say in October, all of which, however, has been upset by the recent freezes, the result of which will be a very large diminution in the final output of domestic sugar in Louisiana and Texas. Secretary Wilson adverts to the fact that the beet and cane sugars of the country amount to nearly a million short tons, the factory value of which, with the beet pulp, is about $135,000,000, or $41,000,000 more than last year.

The Fresno Raisin Exchange is securing many new members.

Filing on Oil Lands

By Edw. L. Payne, Attorney-at-Law

The general rule is that deeded or patented lands cannot be located for oil or other minerals, but that only lands belonging to the public domain can be entered by a mineral claimant. The acts of congress granting indemnity lands to railroad companies have ordinarily, if not invariably, excepted from such lands all that are more valuable for mineral purposes than for agricultural, and the grant to the Southern Pacific railroad contains an exception.

The decisions of the department of interior relating to public lands, so far as they are applicable to the question under consideration, are to the effect that discovery of oil must precede legal location of land for an oil claim; that one who is in possession of government land under a claim that it is more valuable for agriculture than it is for mineral purposes, and who has properly entered the same as a homestead, cannot be ousted or ejected by one who claims the land to be more valuable for mineral purposes, and on the contrary, that one who is in actual possession of government land prosecuting diligently the work of discovery for oil, cannot be ousted or ejected by a later comer who claims the land to be more valuable for agricultural purposes.

These rules have been made applicable to land claimed by railroad companies, to the extent that where it appears that the land was actually mineral in character and known to be such at the time the grant was made to the railroad company, no title passed to the company, and the land is open to entry for mineral purposes.

The department of the interior also seems to have decided that one may take possession of land granted to a railroad company where the mineral has been reserved by such grant, and where the company is only in constructive possession, (that is, such possession as it is deemed to have by reason of its patent, as distinguished from actual occupation) and may locate the same as an oil claim, and if oil is discovered the location may thereby become perfected. I say seems to have decided this point, because the utterances of the department, so far as I have examined them, are not entirely clear upon the point, and it may be that my construction will not be sustained by later decisions.

Where land has been patented to an individual and mineral excepted from the patent (which very seldom occurs) the same rules would be applicable, with the exception that where such patented land is in the actual occupation of the patentee or his successor in interest, no actual discovery of oil having been made on the land, he might, in my opinion, maintain an action of ejectment against any one entering upon the land for the purpose of prospecting for oil, as such a one would have no legal claim under the rule that discovery must precede legal location. So far as I am aware, this exact point has not been decided by the department of interior, and therefore I give it merely as my opinion.

I am also of the opinion that one in actual possession of land patented to him or his grantors, has the right, while in such possession, to use such force as is necessary to prevent an entry upon such land by one seeking to discover oil thereon, where the land is not known to be more valuable for oil than for agriculture, because of the fact that no discovery of oil has actually been made upon it, and also that an innocent purchaser, for value, would be protected by the United States, where no actual discovery of oil had been made upon his land; and if a mineral claimant should gain a foothold and succeed in discovering oil, that the government would in some appropriate way, indemnify such innocent purchaser, providing that location for mineral purposes should be permitted to stand.

With respect to the inquiry as to the effect the Mexican grant would have upon the question, I am of the opinion that if the mineral had been excepted from the Mexican grant, the same rules would apply as though the property had come in the first place by virtue of entry under the United States Land Laws, and not by reason of the fact that it had been allowed to the claimant because previously set off to him by the Mexican grant; in other words, the mere fact of the Mexican grant should make no difference; the question is, were the minerals reserved by the Mexican grant, and if so, can a location be made, although no discovery has actually taken place?

I see no reason why one in actual possession or claiming under a deed, might not file upon the lands so occupied or claimed, if the same is mineral land. Such a person, in order to render the filing valuable, should proceed diligently and continuously to drill for oil for the purpose of making discovery, and while so doing, cannot be interfered with by one seeking to locate the land for the same purpose. Unless the discovery had actually taken place upon the land so filed upon, the filing would not hold without such continuous effort to make discovery. After discovery has been made, then the filing may be held by doing merely the amount of work required for annual development work, or $100 per annum.—E. L. P.

A MODERN CALIFORNIA FACTORY.

The works of the Geo. E. Dow Pumping Engine Co. are located on the Oakland Tidal Canal and have the distinction of manufacturing more different types of pumps than any other firm in the world. This company maintains two display rooms, one at 235 S. Olive St., Los Angeles, and the other at 199 First St., San Francisco, where a large number of pumps are kept on the floor. A visit to these rooms is really an education in pumping machinery.

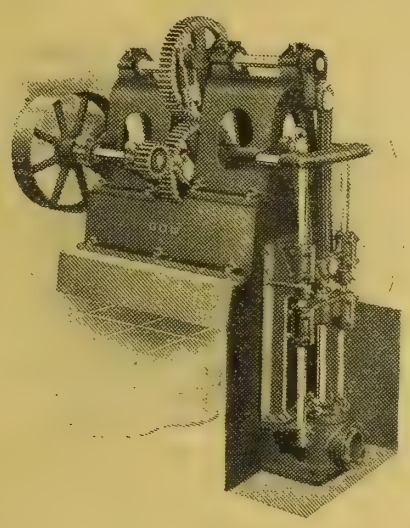
The latest production of this company is a new non-pulsating type of deep well pump, which is illustrated in their advertisement this week. This pump is remarkable for its simplicity and high efficiency, containing no complicated sliding movements or odd shaped gearing. In operating a direct pull is made on the pump rods and a long overlap is secured by a simple combination of cranks and gears. Much influence has been brought to bear on this company from time to time, to induce them to develop a non-pulsating type of deep well pump, but not until the present design was developed, did their engineers feel justified in offering such a pump to the public.

This announcement should prove of interest to all citrus growers and all others who have occasion to use deep well pumps, as the many complicated devices now in use on non-pulsating types of pump, have always proved to be more or less of an annoyance.

The Dow non-pulsating pump has no more complications than the ordinary deep well pump, while its efficiency is much higher than any other type yet developed.

We would earnestly recommend to our readers, when visiting either Los Angeles or San Francisco, that they visit the Geo. E. Dow Pumping Engine Co.'s show rooms and under any conditions to get their printed matter, including Agricultural Pumps, which is a valuable book to any farmer, and their bulletin on centrifugal deep well pump machinery.

Simplicity **Durability**



That is the universal opinion of engineers who inspect the new

DOW DOUBLE ACTING DEEP WELL PUMP

A combination of cranks and plain gearing gives the quick return motion of the pump plunger, and at the same time gives the overlap so essential to avoid pulsation in deep well pumps. All sliding connections are eliminated, and the machinery involved is only three gear wheels and two sets of cranks. Compare this with other deep well pumps.

DOW DEEP WELL PUMPS have the following marked advantages:

No sliding connections.
Few moving parts.
Plunger overlap.
Full adjustable bearings.
Accessibility.
Standard cross heads.
Small pit space required.
All parts of pump head are readily accessible, and in plain view while operating.
Cut gears.
Compact symmetrical design.
Direct pull on all rods.

Then remember that it is built by a firm with nearly half a century experience with pumping machinery.

Do You Eat?

No matter what you Eat, Use or Wear, buy it of McSTAY and save 25 to 50 per cent.

If you haven't been reading our ads start today. Send for our Catalogue No. 41-C and read of the thousands of **wholesale** prices on goods in retail quantities.

Lot B—The big $16.37 Order for only $11.75, which is given here, offers you such bargains as only a big wholesale house could afford to give you. All the items listed are things you need, why not order today—Lot B?

None of these Items sold separate at these Prices

Shipping weight about 200 pounds

25 Lbs. Dry Granulated Sugar. Special price this lot.....$1.25

50-Lb. Sack Queen Anne Flour. Highest patent family flour. Each sack, when empty, is a heavy twilled cotton face towel. Special price this lot.$1.35

10 Lbs. New Crop Pink Beans. Fancy recleaned. Special price this lot..51c

5 Lbs. New Crop Lima Beans. Special price this lot 35c

5 Lbs. German Lentils. Strictly fancy, and our own importation. Special price this lot 38c

1 Lb. Fancy Garlic. Special price this lot 9c

5 Lbs. Fancy 3-Crown London Layer Raisins. Special price this lot....39c

1 Gal. Can Lemon Cling Peaches. This is the whole peach, and with the addition of sugar makes a delicious table sauce. Special price this lot 27c

1 Gal. Can Royal Anne White Cherries. Delicious for pies or for sauce with the addition of sugar. Special price this lot 37c

1 Gal. Can Peeled Pie Apples. Use them instead of the fresh or dried fruit. Special price this lot.....26c

3 Cans Extra Quality Corn. This is our famous Holland sugar corn, none better. Special price this lot.....23c

2 Packages Jello. America's most popular dessert, any flavor. Special price this lot 15c

3 Cans Mustard Sardines. American pack, 5 cent size. Special price this lot 9c

1 Bottle Tobasco Sauce; 35 cent size. Special price this lot.....22c

2 Large Size Dold Dust, known and sold everywhere. Special price this lot 38c

2 Packages Peerless Mince-Meat. Regular 10 cent size. Guaranteed none better 14c

1 5-Lb. Carton Table Salt. Absolutely pure. Special price this lot..8c

1 Bottle Mason's A-1 Imported Table Sauce. Regular 25 cent size. Special price this lot 20c

1 Bottle Heinz India Relish. Regular 30c size. Special price this lot 20c

1 Gal. Kit German Dill Pickles. This is the medium size Salt Pickle, very fine. Special price this lot.....59c

2 ½-Lb. Tins Armour's Chipped Beef. This is recognized as standard everywhere. Special this lot.....23c

2 1-Pt. Cans Delmonico Table Syrup. Regular 10 cent size. Delicious. Special price this lot.....14c

5-Lb. Tin B. 1 Blend Coffee. One of our highest grade Coffees; retails 40c lb. Special price this lot....$1.50

1 Lb. No. C. Tea. Regular 75 cent grade. Name your tea. Uncolored Japan, Green Japan, Gunpowder, English Breakfast, Ceylon, Oolong or Young Hyson. Special price this lot 44c

2 Bottles Pure Flavoring Extract. One 4 oz. lemon and one 4 oz. vanilla; our own manufacture—triple strength. Special price this lot.....53c

5 Lbs. Unpolished Japan Rice. This is the finest rice produced. Retails 10c to 12½c per lb. Special price this lot 34c

10 8-Oz. Bars Special Laundry Soap. This is our leader of Laundry Soaps. Special price this lot.....27c

1 Gal. Pure Rock Candy Drips. The purest and finest syrup made. Royal Brand. Special price this lot.....80c

California Deciduous Fruit Protective League

By Geo. D. Kellogg, Before Cal. Fruit Growers

Unlike the Citrus Protective League, only in the fact that we have the interests of different commodities to protect, and that they have already had experience and achieved victories; while we are only in the camp of instruction and have yet to get our equipment and put ourselves in training for the firing line, preparatory to the removal of the oppositions which are confronting us.

At the Watsonville convention in 1909 the committee on resolutions brought in a report favoring such a league, and a large committee was appointed to take the matter up and organize.

In January, 1910, the committee held two meetings in Sacramento; they organized by the election of officers; they adopted the name of the "California Deciduous Fruit Protective League." They included the dried fruit and nut interests of the state in the organization. There seeming to be a lack of competent leadership available that could give time to the work, and with no organized financial backing, the movement was abandoned for the time.

On Nov. 6, 1911, at a large and representative convention of growers and shippers of fruit held in Newcastle, where standardization rules had been perfected and the system had been unanimously continued, the convention seeing that we were advancing along correct lines, but were lacking in proper alignment and concentration of our forces, the following resolutions were unanimously adopted:

"Be It Resolved, By this Placer County Fruit Growers' and Shippers' Association, in annual session assembled, That we recommend the organization at once of a Protective League, which will include all deciduous fruits and nut interests of California, said Protective League to be properly safeguarded by a board of directors, representing all such interests, they to employ a competent manager to make the organization effective.

"And be it further resolved that having confidence in the wisdom, integrity and ability of J. W. Jeffrey, we do now recommend him as manager, and invite him to take up the matter at once, and perfect such a league, and we pledge ourselves to its support."

Another meeting of citizens of the Sacramento Valley convened in the city of Sacramento at a later date, at which some delegates from the Newcastle meeting were present; advanced positions were taken, and the league was made possible by the voluntary and liberal contributions of those present from different sections of the state. J. W. Jeffrey was again the unanimous choice to inaugurate and put in motion the California Deciduous Fruit Protective League. Mr. Jeffrey accepted the position, and has established his temporary headquarters at 408 Oschner building in Sacramento.

While no definite plans have been adopted as yet, the Protective League has advanced beyond the embryo stage; it is born, and already showing vigorous life, and by proper care of ourselves, it may soon attain the strong stature of efficiency, and do valiant work for our united interests. I can only speak of what the originators of the plan had in mind, of the scope and objects of the league; a little more mature thought and deliberation may take from or add to the original plans, which appeal to my calm, unprejudiced, and better judgment, about as follows:

1st, harmonize and organize all competitive interests into a co-operative league so far as exploiting and developing new markets is concerned. The details of the plan would have to be worked out by a competent board of directors. They could incorporate in their plans, some system by which all markets could be kept supplied, and the danger of oversupply for all markets be largely eliminated. The trade could also be controlled to better advantage, and dishonest dealers disciplined to a larger extent.

2nd. Matters pertaining to transportation, export and import duties, standardization, and many other matters of common interest to the fresh, dried and preserved fruit producers, together with the vast nut interests of the state. This enormous amount of tonnage consolidated into a harmonious compact body, could speak with authority and power that would command a respectful hearing before any tribunal, and to a large extent, get redress for any wrongs that we may become restive over.

I shall not attempt at this time to speak further of the possibilities of such a league; although I thoroughly believe that there is at this time a large open door of opportunity for its inauguration, covering the foregoing interests, and many others which may be developed by a vigorous prosecution of the plans that may be entered into by a competent advisory and executive committee, to be executed by a live and capable manager.

The manager who has already been selected, and entered upon the work, is well known to us all, ex-State Horticultural Commissioner J. W. Jeffrey, who has shown great executive ability and an intelligent interest in the fruit industry of our state. He is thoroughly acquainted with our wants, familiar with this class of work, his honesty and integrity unquestioned; in him we would seem to have an ideal executive officer.

So far as I am informed, there has been no organized plan to finance this important work other than voluntary subscriptions, which have only been sufficient to inaugurate the movement. I trust this convention will approve of the organization of such a league, and give it some form of indorsement, and render it such assistance as may be consistent that will make it effective. I presume that the league itself, through its organization, would have to devise its own financial plan that will insure its permanent stability. Our state horticultural commission will ever have a common interest in the work of such a league, and it is to be desired that there should be the utmost harmony between these organizations.

Our worthy state commissioner of horticulture, Prof. A. J. Cook, gave his most hearty support to a movement of this kind at our convention at Newcastle, in which he pledged himself to give it such assistance and co-operation as could be found within the power of his office. So, by united effort, we shall look forward to good results coming from the permanent organization of the California Deciduous Fruit Protective League.

Household Department

CHRISTMAS.

By a beautiful road our Christmas comes,
A road full twelve months long,
And every mile is as warm as a smile,
And every hour is a song.
Flower and flake and cloud and sun,
And the winds that riot and sigh.
Have their work to do ere the dreams come true,
And Christmas glows in the sky.

The holly and cedar and mistletoe.
They thrilled, when the nights were chill,
For the maiden's glance and the madcap dance
And the lover's foot on the sill.
For the Christmas mirth and brave pine grew,
Serene and straight and tall,
The deep woods knew in their dusk and dew
When the dearest of days would fall.

To the beautiful home our Christmas comes,
The home that is safe and sweet,
With its door ajar for the beam of the Star,
And its corner for love's retreat.
There the mark on the wall for the golden head
Is higher a bit, for lo!
Between Christmas coming and Christmas sped
There's time for the bairn to grow.

Our Christmas comes with a royal grace,
(Forget the ancient grudge!)
'Tis the open hand that must bless the land,
(Uplift the toiling drudge!)
And who that has gifts shall hold them back,
And who that has cheer shall wait,
When there's joy in the sky, and the ill things fly,
And the Christ-Child knocks at the gate.

'Tis a beautiful time when Christmas comes
All up the street and down,
For hearts alight makes faces bright
When Christmas comes to town.
Neighbor and friend in gladness meet
And all our neighbors dear,
When the Christmas peace bids evil cease
In the holiest day of the year.

The fair white fields in silence lie,
Invisible angels go
Over the floor that sparkles hoar
With the glitter of frost and snow.
And they scatter the infinite balm of heaven
Wherever on earth they stay.
And heaven's own store of bliss they pour
On the earth each Christmas Day.

'Tis a beautiful task our Christmas brings
For old and young to share,
With jingle of bells, and silvery swells
Of music in the air.
To make the sad world merry awhile,
And to frighten sin away,
And to bless us all, whatever befall,
Is the task of Christmas Day.
—Margaret E. Sangster.

A SNOWBOUND SANTA CLAUS.

By Izola Forrester.

The Pacific Overland Express from Omaha to the coast stopped short with a slow, reluctant jerk. For over ten miles since noon it had tried to make its way through the snowbergs that lay in huge drifts on the track, and now it gave up the fight and rested at the eastern base of the Great Bear Pass.

Nell blew on the frosted window pane until she had melted a peep-hole to look through.

"Just mountains, and mountains everywhere," she announced dolefully, and four other young Harrisons listened in doleful sympathy. Christmas in a snowed-up car would be something dreadful.

"It's five o'clock now," said Max, "and the conductor says we won't be out before tomorrow, maybe, because they've got to telegraph for a snowplow to help us out."

Curled together in a disconsolate heap on one seat Benjy hugged Tomikins up close, and they sobbed in united woe.

"No candy, no turkey, no ballses, or dollies, or anysing," cried Tomikins.

"And no Santa Claus, too," added Benjy, with a fresh howl.

Even Jeanette, as big sister, felt the tears gather slowly in her eyes, in spite of her fifteen years, as she thought of the thirty-six miles that lay between them and Silver City.

"Will Santa Claus find us 'way out here?" asked Nell.

"Sure he'll find us," promised Max, valiantly. "He'll make a bee line right over the mountains with those ponies of his——"

"Reindeerses," prompted Benjy, sitting up and taking an interest in life once more.

"Don't you suppose that papa's beginning to worry about us, Jeanie?" asked Max.

Jeanette nodded her head. She knew if she tried to speak she would curl up in a heap like the twins and have a good hard cry.

At the end of the train, in the private car Pocahontas, sat Mr. John P. Ridley. It did not please Mr. Ridley that the Pacific Overland Express should be held up by a snow storm.

He kept his private porter busy running back and forth through the train, finding out what chances there were of getting through Great Bear Pass that night. It appeared that Mr. Ridley was especially anxious to get through that night for two reasons. The boxes and numerous small pieces of baggage that were stacked in one end of the car explained one of these reasons. The explanation of the other Mr. Ridley reserved to himself, to the telegraph operator back at Barker Junction, and to Warren, general manager of the Lakota mines in Silver City.

He was sorry for Harrison. He was a hard worker and thoroughly competent, but they needed a younger, quicker man as assayer at the Lakota mines. Harrison was, if anything, too painstaking. He experimented. Also, he was strictly conscientious. If it had not been for the coming deal in the Sunset mine he might have kept him; but a thing like that needed a different sort of a man. Not that it wasn't a "square deal." He declared himself that the Sunset was a good thing, and only half developed, but so far the output had not justified the price he had put on it. In case of questions asked by the buyers, he did not want exactly a false report made by the assayer, but he did want a man who could see beyond the specimens in his hands and who would look after the interests of his employer enough to prophesy favorably on the future of the Sunset. Harrison was not good at prophesying.

Therefore a telegram had gone forth from Barker Junction which rendered the position of assayer vacant, and Mr. Ridley was very anxious to arrive in Silver City in time to meet the new assayer from Butte and instruct him on a few minor points of prophesying, before the buyers for the Sunset should interview him.

When six o'clock came he had his private dinner prepared in his private kitchen by his private chef, and he enjoyed it as well as his dyspepsia would permit him to enjoy anything, while in the cars ahead the general public rummaged in lunch boxes and baskets, and shared with one another remains of cold chicken and ham sandwiches in philosophical merriment over the situation.

At half past eight Mr. Ridley found his privacy growing monotonous. On Christmas Eve, in a snow-bound train, stranded in the heart of the Rockies, privacy is a bore, and so Mr. Ridley took a stroll through the train.

He found relief for a while in the smoking compartment of the first sleeper. There were several persons aboard the train who recognized the value of Mr. Ridley as a fellow passenger, and were glad to make him welcome.

He had noticed in passing through the sleepers a rather noisy crowd of youngsters who were singing, playing

California Cultivator
Clubbing Price List

For Season 1911-1912

This magazine price list is prepared annually for the convenience and benefit of Cultivator subscribers. The prices given allow our readers the benefit of the lowest figures possible, in return for which, all we require is that to all orders a year's subscription to The Cultivator (class 18) be added at 90c (regular price $1.00 per year).

Find on this sheet a very complete list of the most popular magazines. We can, however, supply any periodical published. The lowest price on any not listed here will be quoted on request. Let us make you a price on any combination you may desire.

Periodicals in any combination may be ordered to the same or different addresses. Foreign or Canadian subscriptions are extra on account of added postage, and prices must be gotten by correspondence. Subscriptions may be either "new" or "renewals (except where otherwise stated in the list), but it is important that this information be given in each case.

Books—Send us a postal for our list of agricultural books which we supply subscribers and which we recommend as most suited to California conditions.

The pricing of various combinations of magazines is a simple matter; all are listed according to class number and this class number multiplied by 5 gives the cost price.

EXAMPLE:

Class No.	Regular Price
23—American Magazine	$1.50
35—The Review of Reviews	3.00
20—Good Housekeeping (or Cosmopolitan	1.50
18—Cultivator	1.00
96×5=$4.80—Club price for all. Amount saved on this club	$2.20

Brightest, Strongest and Best

You need the most powerful and reliable light you can get when loading the wagon for market in the early morning.

Rayo lanterns are the most powerful and reliable lanterns on the market.

They do not flicker, but burn with a steady, brilliant light. They will not blow out. They are economical, because, besides being moderate in price, they give you the greatest light value for the oil they burn.

Rayo lanterns are made in numerous styles, sizes and finishes, to suit any use. Best material and workmanship. Simple in construction, yet reliable and strong.

All Rayo lanterns are equipped with selected Rayo globes—clear, red or green, as desired. Wicks inserted in burners, ready to light.

games and otherwise having a jolly time.

It was after eleven when he left the smoking compartment. On his way back through the cars the conductor met him and explained apologetically that the wires were down for several miles ahead in the pass and it had been necessary to send back to Barker Junction in order to telegraph ahead for a snow plow. It might be several hours before they could go on—possibly not before the next morning.

Mr. Ridley was annoyed. As he went on through the narrow curtained aisles of the sleepers, he felt vaguely resentful toward the whole system—railroad, snow storm, passengers and all—as a combined force of circumstances that could detain a man like John P. Ridley against his will. Suddenly he stopped short before section four in the third sleeper. The two berths were made up, and they were close quarters, too. In the upper one slept Max, and the twins (Benjy cuddled up crosswise at the foot) and in the lower were Nell and Jeanette.

But all that Mr. Ridley saw was a row of stockings pinned up on the long curtains like misplaced tails on a donkey sheet. He stared at them through his eyeglasses thoughtfully. Two small ones just alike—well darned around the toes and heels, one long, double-kneed one for a boy who might possibly play marbles, and two fine-ribbed ones with small feet.

After a minute's inspection, Mr. Ridley walked back to the end of the car and had a talk with the porter. When he had finished he knew the personality of each stocking and the requirements of its owner. And then a very peculiar thing happened on the Pacific Overland Express. Back and forth between the third sleeper and the private car Mr. Ridley's private porter marched, his arms full of boxes and parcels; and when it came to opening them before section four, Mr. Ridley himself took a hand.

When the five stockings were full and bulged out at the tops, there were other parcels placed cautiously in the little hammocks that hung at the head and foot of the lower berth, and Mr. Ridley caught a glimpse of Nell's brown pig-tails, and Jeanette's yellow curls lying side by side on the pillow. When he returned to the private car after all was done he was smiling comfortably to himself, and had forgotten all about the wretched facilities of railroads for dealing with snow storms. At home there were two heads, very similar to those in section four, waiting for papa to come. That was the first reason why Mr. Ridley wanted to get over Great Bear Pass that night.

But, just as the private porter gathered up the last pieces of string and paper from the aisle and started away after Mr. Ridley, Max's head appeared at the curtain opening of the upper berth. His hair was standing on end as only the hair of a pillow-tousled boy can act, and his eyes were round with sleepy, surprised amazement when he saw the bulging stockings.

In half a minute he had dropped from the berth and a small white ghost in baggy night clothes stole through the cars after Mr. Ridley, and never stopped until the vestibule door of the Pocahontas shut out the world from its privacy.

At half-past seven on Christmas morning the snow plow came through Great Bear Pass. The blizzard had stopped and it was clear and cold. A committee of five waited for admittance in the vestibule of the Pocahontas while Mr. Ridley bathed, shaved and dressed. It was a joyous, excited committee Max led as guide, with Nell hugging his shoulder, and Jeannette tried to hold the twins in check, until finally the private porter ushered them in past the tiny kitchen and pantry, all shining brass and tiles, past the little compartment dining room, into the parlor section, with its dark green hangings and deep, low willow chairs, its bookcases and piano, and broad windows.

Mr. Ridley rose from his desk to greet them. It was an awkward moment. Max and the girls waited doubtfully for each other to speak, until Tomikins broke the ice.

"Merry Cwismus!" he said.

"The same to you, sir," responded Mr. Ridley, a twinkle gleaming in his eyes. "Merry Christmas to you all!"

Then Jeanette began, "We came because we wanted to thank you for ——"

"For being Santa Claus——" added Nell eagerly.

"I saw you," exclaimed Max, forestalling any possible disclaimer. "I looked over the top of the curtains. My! But you just ought to have seen the kiddies when they found those music boxes!"

Christmas is a lonesome affair all by one's self. There were five guests in Mr. Ridley's dining room, and it was such a merry, delightful breakfast that no one noticed the time until the train began to move slowly forward.

"We're going!" shouted Max joyously. "Rah! I really believe that papa stayed in the depot all night."

"Are you going to Silver City?" asked Mr. Ridley.

Of course they were. Why, didn't he know that before? Individually and in chorus they all told him how it happened. 'Way back, when the twins were only a year old, the dearest little mother in the world was called to rest, and since then they had lived in Chicago with Grandmother Wilcox until papa could take them all. It had been a long time to wait—almost three years—and they had been rather poor, too.

"Not raggedly poor," protested Nell. "Just shiny."

But now everything was changed. Max's brown eyes sparkled with sturdy pride as he told how his father was assayer at the Lakota silver mines in Colorado. Perhaps Mr. Ridley had heard of them. It appeared that Mr. Ridley had—slightly. It was a fine position Max assured him, and steady too. That was why papa had sent for them all to come to him, because he was sure it would last. And it wouldn't be hard at all, because Jeannie was going to be housekeeper and they would all help her; and, last of all, they just wanted to tell Mr. Ridley one thing—there wasn't a single father in the whole world quite as splendid as the one who was waiting for them in the depot at Silver City.

Mr. Ridley listened, a twin on each knee, and smiled. When breakfast was over, Jeanette said they must go back, because the kiddies were clamoring for their music boxes. So they waved their hands to him from the vestibule and called "Marry Christmas." After they had gone Mr. Ridley went and stood before one of the car windows looking out at the flying stretches of pine-dotted mountain side.

Finally he turned to his desk. A pad of telegraph blanks lay on it, and he wrote a message and called the private porter.

"Send this as soon as we reach Crescent," he said.

It was the last gift from Santa

New Land Opening

Under the

Kuhn California Project in the Sacramento Valley

The canal, drainage and road construction has been completed on the Delevan and Maxwell Units and these lands are now being sold in 10, 20 and 40-acre subdivisions.

The soil is a deep alluvial silt loam and is some of the best in the valley. The main line of the Southern Pacific Railroad passes through the land. Four trains daily each way North and South.

Towns, Schools and Churches Near at Hand

CROPS—All kinds of fruits, including oranges, lemons, cereals, seed, alfalfa, cattle, hogs and chickens.

WATER SUPPLY—Practically unlimited. Cost to the irrigator very low. Canal and drainage system the very best. Water delivered to boundary of every 40-acre tract.

TRANSPORTATION—Both by rail and river to the great metropolitan centers.

LAND PRICES—Low and terms of payment easy.

If you want to secure a home in California's Famous Valley, where climate, soil and water are combined to work for you overtime, cut out the attached coupon and mail to us for full particulars.

AUNTIE BROWN'S CHRISTMAS SHOPPING ADVICE.

By Alice Jean Cleator.

The morning after Christmas Day
I met my Auntie Brown.
She caried packages galore
And was en route down-town.

Said she, "To see me out today
You seem to think is strange,
But listen, niece, each gift I gave
I'm taking to exchange.

"The slippers which I bought for John
Were just three sizes small.
The smoking jacket was too large
For Uncle Percival.

"And, oh, the gloves for Cousin Sue
Should have been number six;
I ordered them with Johnny's skates,
And got the sizes mixed.

"And Rob's fur cap was so immense
It quite obscured his face;
The rings and bracelets were too small
For Marjory and Grace.

"Well, I must go," she sighed, "but, niece,
Whene'er you give surprises
Of Christmas gifts, don't ever give
A thing that comes in sizes."

◆◆◆◆◆◆◆◆◆◆◆◆◆◆◆◆◆◆◆◆◆◆◆◆◆◆

Claus; and Warren, general manager of the Lakota mines smiled when he received it. It read: "Retain Harrison." (sgd.), J. P. Ridley. —Outing.

CHRISTMAS SUGGESTIONS IN RECIPES.

Fruit Salad.

Fruit Salads are frequently served at luncheon—sometimes as a first course—and may be made of one fruit or a combination of several; those most commonly blended being grapes (skinned and seeded), oranges, grape fruit, bananas and apples. Serve with French or mayonnaise dressing.

The chief rules to be remembered in making salads are:

All salads likely to be dry, as well as those having no dominating flavor, are better if they are marinated with a French dressing some time before serving, in addition to the dressing added at table.

It is not enough to wash the salad plants; they must be dried also, for the dripping from the leaves in the serving dish would thin the dressing and make it insipid.

A good portion of the dressing must be mixed with the salad, not all poured over the top.

Cabbage Salad.

Put the milk and vinegar on to heat in separate sauce-pans; when the vinegar boils, add butter, sugar, salt and pepper, and stir in the chopped cabbage; cover, and let scald and steam—not boil—for a moment, meanwhile, remove hot milk from stove, cook a little, and stir in the well-beaten and strained yolks; return to stove, and boil a moment. Dish cabbage and pour custard over it, stir rapidly with a silver spoon until well mixed, and set immediately in a cold place.

Plain Cold Slaw.

Slice cabbage very fine, season with salt, pepper, and a little sugar; pour over vinegar and mix thoroughly. It is nice served in the center of a platter with fried oysters around it.

Cranberry Sauce or Jam.

Cook berries with ¼ of their measure of water till soft. Put through colander to take out skins. Add equal amount of sugar and cook five minutes.

Roast Pork.

A small loin of pork, three tablespoons breadcrumbs, one onion, half a teaspoon chopped sage, half teaspoon salt, half teaspoon pepper, one ounce choped suet, one tablespoon drippings. Separate each joint of the loin with the chopper, and then make an incision with a knife into the thick part of the pork in which to put the stuffing. Prepare the stuffing by mixing the breadcrumbs together with the onion, which must have previously been finely chopped. Add to this the sage, pepper, salt and suet, and when all is thoroughly mixed, press the mixture snugly into the incision already made in the pork, and

(Continued on Page 669.)

LIGHT UP!

You can transform any kerosene (coal oil) lamp or lantern into dazzling brilliancy with our wonderful **Bright Light Burner.** 50 candle power invisible and **unbreakable Steel Mantle.** Brighter than electricity, better than gas or gasoline, and **perfectly safe.** No generating—simply light like any kerosene lamp. Nothing to get out of order. Positively will not smoke or flicker.

Hay.

Arrivals of hay during the past week have been 3,600 tons, which amount is a heavy increase over last week's small arrivals. Quite a bit of this amount consisted of alfalfa that was ordered forward for shipments. Somewhat of horse hay was brought in also for export.

The tone of the market has been quite bullish, and prices have advanced from our last week's quotations, and at this writing the feeling is strong and the tendency all points toward a better market.

There has been quite a little movement at some of our large centers. Hay has changed hands during the last week at prices that are above the basis of our present market here, showing the confidence in the situation by those large operators who have judged the present situation both around the bay and at interior points, and who are thoroughly in touch with conditions surrounding us.

The medium types are those that have shown the most marked advance, as there is a heavy demand at interior points at the present time for these varieties. Many of those holding this type of hay are unwilling to dispose of same until the outcome of the present situation can be more clearly seen.

Alfalfa hay has advanced sharply and quantities are now difficult to obtain, as this class of hay is in remarkably good demand at interior points where it is being fed to stock that usually at this time of the year depends upon pasture.

We quote the wholesale prices in round lots on today's market as follows, viz.:

Fancy Wheat Hay	20.00@21.00
No. 1 Wheat or Wh & Oat	17.50@18.50
No. 2 Wheat or Wh & Oat	13.00@15.50
Choice Tame	18.00@18.50
Other Tame Oat	12.00@16.00
Wild Oats	12.00@15.50

Citrus Fruit Market

LOS ANGELES, Dec. 20, 1911.

Southern California is not yet shipping very heavily, but packing houses in nearly every section are running to a limited extent. This is owing largely to the slowness of coloring. Tulare and Butte Counties have practically finished, at least as to heavier shipments. The fruit has been running well up to regular sizes and has good color.

The lemon market is decidedly quiet, though the holiday trade stimulated some sales which practically cleaned up the few shipments going forward.

Shipments.

Shipments from Southern California since November 1: Oranges, 816 cars; lemons, 667; total, 1,483. To same date last season: Oranges, 2,128 cars; lemons, 613; total, 2,741. Tulare and other central California counties up to December 18 shipped 2,870 cars of oranges and 68 cars of lemons; last year, same date, 1,938 cars all citrus fruits. Butte County and other northern sections, 387 cars oranges; last year's shipments at the same date, 104.

LOS ANGELES, Dec. 18.—Five cars navels sold. Note.—Standard grades 25c discount; 80s and larger, also 288s and smaller 25c discount, unless specially announced otherwise.

OROVILLE CITRUS SHOW.

(Continued from Page 643.)

Of course Paradise came in with a magnificent exhibit of apples, the Ehman Olive Company with olives and oil. Other sections made some remarkably fine exhibits.

The fruit prize winners were:

Largest exhibit of citrus fruits—First, Hammon orchards.

Best general exhibit of oranges, showing commercial pack—First, Butte County Citrus Association.

Decorative display of citrus fruits—First, Stewart Fruit Company.

Citrus fruits and packing demonstration—First, Crane and Son.

Neighborhood display of products—Wyandotte and Palermo colony, both first, and deserving of special mention; second, Honcut.

Farming and dairy products—First, Gridley.

Best special feature, exhibit of figs—First, W. H. McNamee.

Apple exhibit—First, Paradise; second, Cohasset. (Entitled to special mention.)

Nuts—Mrs. A. E. K. Bidwell, Chico.

Olives, nuts and citrus fruits—First, Los Verjeles Land and Water Company.

Individual Washington navel exhibit—First, Chambers orchards.

Lemons and grape fruit—First, Miller and Watkins.

Individual exhibit of diversified products—First, Sancomb and Finney, Thermalito, Deserving of special mention.

Olive products—First, Ehman Olive Company.

California grown rice—First, Balfour-Guthrie Company.

CHRISTMAS SUGGESTIONS.

(Continued from Page 667.)

sew together the edges of the meat with needle and thread, to confine the stuffing. Grease well a sheet of kitchen paper, with drippings, place the loin in this, securing it with a wrapping twine. Put to bake in a dry baking-pan, in a brisk oven, basting immediately and constantly as the grease draws out, and roast a length of time, allowing twenty minutes to the pound and twenty minutes longer. Serve with apple sauce or apple fritters.

* * *

Miss Katherine Meeder again furnishes us a couple of tested recipes. The first is for pudding, not the ordinary English plum pudding, but better and much easier made. We hope Cultivator readers will try it and report.

Christmas Pudding.

One cup molasses, 1 cup raisins, 1 cup currants, 1 cup suet (chopped fine), 2 cups flour.

I scant teaspoon soda and a little salt, allspice, nutmeg, cinnamon and cloves; add enough sweet or sour milk to make a stiff batter. Boil four hours. If put in two tins half the boiling will suffice.

Molasses Cake.

One cup molasses, ½ cup sugar, 1 egg, 1 heaping tablespoon of lard and butter mixed, ginger, cinnamon and salt to taste. Flour enough to make a stiff batter. One teaspoon baking soda put in cup of hot water and poured into mixture the last thing.

CHRYSTEMESSE BELLS.

Two sorrie thynges there be—
Aye three;
A neste from which ye fledgelings have been taken,
A lambe forsaken.
A redde leafe from ye wilde rose rudely shaken.

Of glad thynges there be more—
Aye four;
A larke above ye old neste blithely singing,
A wilde rose clinging
In safety to a rock, a shepherd bringing
A lambe found in his arms, and
Chrystemesse bells a-ringing.
—Exchange.

THE DECORATION FOR CHRISTMAS DINNER.

The tablecloth is pure white linen, napkins the same. At each of the corners put a sprig of holly with its scarlet berries. At the stem is tied a bow of scarlet satin ribbon, with ends eight inches long; this ribbon is two inches wide and the same shade as the berries. Pin it at the bow to the cloth at the corners of the table. The center piece is oval, twenty-two inches long, seventeen wide. This is made of white sheet wadding, the glazed side up. Around the edge of this is a border three inches wide, of holly leaves thickly dotted with the berries. Sew this on with fine thread. Over the surface of the wadding strew small clusters of the berries. In the center of this piece is a tall glass vase filled with red roses. Around the stem of the vase is tied a lot of half-inch satin ribbon of the same shade as the berries. To this are sewed twelve pieces of the same ribbon, each piece being seven inches long, these pieces are fastened to the wadding, equal distances apart, like the spokes of a wheel. At the end of each piece where it is fastened to the wadding is a small bow of the ribbon.

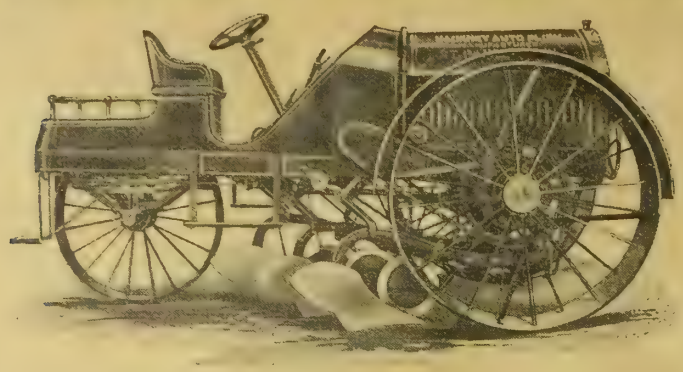
At each plate is a small card made of celluloid and satin. Cut a piece of transparent celluloid four and a half inches long, three wide; on one side of this paint a sprig of holly, having five leaves and three clusters of scarlet berries. Cut a piece of heavy red satin, same shade as the berries, half an inch large, all around to the depth of half an inch. On the right side of the satin paint "Merry Christmas, 1900," in gold fancy letters and figures. Put the satin and celluloid pieces together, the painted sides out, and fasten at each corner with a couple of stitches of red silk. On the celluloid side fasten tiny bows made of red baby ribbon. The fringe of the satin back forms a border for the card.

The dining room is prettily dressed with clusters and festoons of holly. The sideboard scarf is plain white linen, hemstitched all around, and has a three-inch wide border of holly leaves and berries on each end; the border of leaves and berries is sewed on with fine thread. Over the sideboard is a star of holly leaves. In the center of this is a large cluster of the scarlet berries, and on each point at the very end is a small cluster of the berries.—Ex.

Much food is in the tillage of the poor, but there is that is destroyed for want of judgment.—Prov. 13:23.

If vain our toil,
We ought to blame the culture, not the soil.
—Pope.

HACKNEY AUTO-PLOW



The Great One Man Outfit

The Greatest Labor Saving Machine On Earth To-Day For The Farmer

Just the machine for the average farm; a tireless worker, day or night; simple to operate, at small expense ,and sold at a moderate price.

Will do all the plowing, harvesting, haying, hauling, feed grinding and all other work where a power machine is needed on a 120 to 640 acre farm.

Performs the work of ten horses and three men plowing, and does away with the labor and expense of caring for them.

Has 40 horse power engine; three 14 or 16 inch plows; automatic steering device; rotary harrow and road grader attachments.

Catalog and full information free.

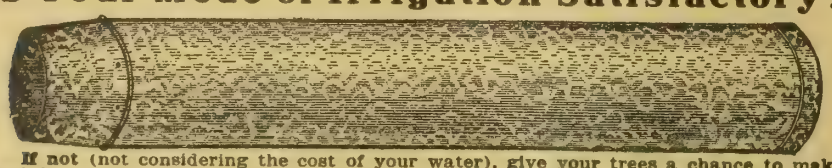
Is Your Mode of Irrigation Satisfactory?



If not (not considering the cost of your water), give your trees a chance to make good by giving your orchard the proper amount of water all over same, and not three-quarters of your water supply within forty feet of your head flume.

The surface irrigating pipe we manufacture will remove this obstacle—will cut your water bill—is more convenient to use and will last a life time.

Write us, stating your requirements and we will cheerfully furnish you with prices and information desired.

We also manufacture Ells, Tees and Gates for this special pipe and are in a position to manufacture any special fittings you may require.

California Cultivator

Vol. XXXVII. No. 26. LOS ANGELES: THURSDAY, DECEMBER 28, 1911 One Dollar the Year

Date Culture in California

By Dr. J. Eliot Coit. Pomologist, California Experiment Station

For the last two years small quantities of California grown dates have appeared on the market and on account of their very fine quality and the neat and cleanly appearance of the package, they have commanded prices greatly in advance of imported dates. The question as to whether the high-priced Deglet Noor date can be produced commercially in California may now be answered in the affirmative. As a result of the stimulation of interest in dates and date culture, a large number of people are today seeking information in regard to various phases of the business. Until the last year or two dates have been grown only in an experimental way, but the success of some of these small test orchards presages a large expansion in the near future.

Where Dates May Be Grown.

While date trees can be grown as ornamentals wherever the orange is grown, they will not properly mature fruit in any except the hottest and driest portions of the state. Perhaps a small quantity of very early soft dates may be matured in the hottest parts of the San Joaquin and Sacramento Valleys. The best quality dates, however, are limited to the southeastern corner of the state where the thermometer may be expected to range above 100 degrees almost daily for five months of the year and where the moisture content of the air is very low during the season of the date harvest. While it requires a very large total number of heat units to properly ripen dates, the trees are fairly resistant to frost. Date palms may be expected to endure on frosty nights a temperature of 20 degrees for a short time without serious injury. Another very important requirement is dry air at harvest time, for should a rainy spell occur just as the dates are ripening they are very apt to ferment and decay on the trees.

The date palm is not a typical desert plant, however, for while its head must be in the burning sky its roots must be well supplied with water. It cannot survive on a desert without water and considerable quantities of water are required to make the date a profitable tree. It is estimated that water equivalent to one miner's inch continuous flow for each five acres would maintain a bearing date orchard. All of the requisite conditions may be found in many places throughout the Imperial, Coachella and Colorado Valleys and the country around Palo Verde and Blythe, Riverside County. At other places in the state, such as the vicinity of Riverside, Redlands, Fresno and Oroville, early dates might be grown in a small way for home consumption and even placed on local markets to be sold in the fresh uncured condition. The Coachella, Imperial and Colorado Valleys are, however, the regions where date culture is destined to assume commercial proportions.

As to type of soil the date palm is not very particular. A very stiff adobe is not desirable, neither is a light sand which is low in plant food. Any kind of loam soil which is easy to work is suitable. One of the most striking characteristics of the date palm is its great resistance to alkali. It will grow and flourish on soils far too salty to produce alfalfa, grapes or a number of field crops. It is therefore especially suitable for the reclamation of white alkali lands which may be bought very cheaply. On very strong alkali it is difficult to raise seedlings, and offshoots may require some fresh soil well mulched with straw in which to take root. Once started, however, the tree will thrive under such conditions.

Typical Six Year Old Deglet Noor Tree Carrying Two Offshoots. TwoNewly Transplanted Offshoots May Be Seen in Background. Most of the Fruit Was Gone When Photo Was Taken. Indio.

Kinds of Dates.

The date palm like most deciduous fruit will not reproduce itself true to variety from seed. Seedlings vary greatly in character of foliage, precocity, fruitfulness, color, shape, size, season of fruit, and other characteristics. The only possible way to propagate varieties is by transplanting the offshoots or suckers taken from the base of the young trees. Standard African varieties such as Deglet Noor and Fard are simply extra good chance seedlings which were discovered, named, described and propagated in Africa many years ago. The U. S. Department of Agriculture has been collecting varieties of Old World palms for ten years, and upwards of 200 varieties of offshoots have been planted in the co-operative test garden at Tempe, Arizona. This large list of varieties may be classified according as the fruit is soft, medium or hard. The dates ordinarily sold in bulk by California grocers are the Halawi variety produced in Mesopotamia. The small dark-colored dates sold by grocers are the Fard grown in the Semail Valley near the Persian Gulf. Practically none of the dry or Arabian bread dates have been placed on American markets and they are therefore unknown to the American consumer. They are perfectly dry and may be handled like peanuts. They are filled with sugar and have a rich, nutty flavor. Offshoots of a number of different kinds of dry dates were imported and are now fruiting abundantly in California. These probably will sell at a smaller price than the soft dates, but on the other hand the loss from fermentation is practically nothing and the expense of harvesting and packing is very small. Some seedlings are intermediate between the soft and hard types.

The varieties may also be classified according to whether the sugar they contain is cane sugar or grape sugar. Cane sugar dates are much sweeter and not nearly so sticky; neither do they cloy the palate as do the grape sugar dates. The Halawi is a good example of the sticky grape sugar type, while the Deglet Noor belongs to the cane sugar class. The grape sugar dates greatly outnumber the more desirable cane sugar varieties.

Of the two hundred or more varieties under test, a large number have have shown themselves to be but poorly suited to American conditions. Some have not fruited as yet, but perhaps twenty-five varieties will prove quite successful. After making a personal study of the fruit at the Tempe test farm for two years I consider the following among the most desirable for California planting. Soft dates: Deglet Noor, Itima, Bent Kebala, Tadala and Maktum. Dry dates: Thuree, M'Kentichi Degla and other varieties will come to the front. Horra. A very fine quality soft date suitable for local use but doubtful for shipping and a shy bearer is the Rhars. As the tests continue no doubt

Planting Offshoots in Orchard Form.

As a rule only young palms bear offshoots, the growth of trees over eight or ten years old being limited to the one terminal bud. Most young palms will produce from five to fifteen offshoots which are cut away from the mother palm and transplanted as fast as they reach the proper size, which is from five to fifteen pounds with the leaves trimmed off. April and May are the best months to transplant. The offshoot should be set to the depth of its greatest diameter, with the central bud somewhat above the irrigating water level. A shallow basin around the plant filled with straw facilitates irrigation and prevents the rise of alkali until the roots have taken hold of the soil. It is very important that the soil be kept constantly wet by frequent irrigations. The palms should be set not less than 30x30 feet and 30x36 feet is preferable, at which distance forty offshoots would be required for an acre. The subsequent culture is very simple. Frequent irrigations with an occasional cultivation to keep the weeds down and the surface of the ground loose is sufficient.

The Sex of the Date Palm.

The date palm belongs to that class of trees which bear male and female blossoms on separate plants. Somewhat more than 50 per cent of the seedlings will turn out to be male palms. In a state of nature this proportion of males will so fill the air with pollen that artificial pollination is unnecessary. In commercial plantings, however, it economizes space to limit the proportion of males to females to about one to twenty or thirty and resort to artificial pollination. The process of pollination consists in cutting the large bunches of male bloom and dividing them into small strands. One or two strands when tied over the female bloom is sufficient to pollinate an entire bunch. This work may be performed very rapidly and cheaply provided a sufficient number of male palms which bloom at the right time are near at hand. The date ovary is three-celled, but one fruited by abortion. If the blossoms are not pollinated, there will be produced a large bunch of small seedless, worthless dates borne in clusters of threes. These seldom ripen and usually simply hang on till the winter cold and rain brings about their decay. It is not uncommon for city newspaper reporters to mistake these unpollinated dates for some new thing of value and indulge in scarehead articles about the wonderful possibilities of the newly discovered seedless date. A male seedling which is found to produce a very large quantity of good pollen is valuable and should be propagated by offshoots, these to replace the more inferior males. For very late blooming female varieties it is practicable to preserve

(Continued on Page 680.)

Citrus Trees

First Quality Trees
will be Scarce in 1912

A block of 20,000, one year old buds. First Quality Trees. Free from scale— (no scrubbing) *mostly* ⅝ *and up now*

THE MAN WHO WAITS is generally the disappointed man.
BUY NOW, WHILE THE GOOD STOCK IS AVAILABLE. It will cost you no more and probably less than if you wait until Spring.
THE BEST ARE CHEAPEST. First-class groves have never been made out of sickly seedling trees. That few cents per tree saved at time of purchase often shows dollars per tree loss in after years.
BUY THE BEST; IT PAYS. We have got a limited number of trees to offer for the season of 1912—

Eureka and Villa Franca Lemons. Washington Navels.
Valencias and Marsh Seedless Grape Fruit.

Ninety per cent of our trees are strictly first-class, strong, one-year-old buds, the majority of which will measure ⅝ inch and up now on sour stock roots. True to Name, and the buds of which were carefully selected from the best fruiting trees. They have been carefully grown, are straight and entirely free from scale (no scrubbing). We invite inspection and solicit correspondence.
We will sell these trees at current prices. Expenses refunded to out-of-town purchasers. Twenty years' experience in expert citrus horticultural work.

Citrus and Tropical Fruits

THE SEEDLESS LEMON.

By Dr. F. Franceschi.

That this variety cannot be called a novelty is shown by the fact that it was registered and described in the classical work on Citrus Fruits by Risso, nearly one hundred years ago. At that time it appeared to be well known in Italy, in Southern France and in Spain, although its original birth place is not given in said work.

Here is the translation of the description by Risso, which I believe well worth reproducing for comparison with the trees which were recently announced from San Bernardino and from Santa Cruz, California. "A very distinct variety, not only for its seedless fruits, but also for the following characteristics: 'Stem rather weak and thin, very smooth, branches also not much vigorous and armed with small spines; leaves ovate oblong, thin, pale yellowish green, denticulate, on short petioles with heart-shaped wings; flowers small, petals 4 to 5, purple on the outside, stamens shorter than the pistil; fruits of medium size, ovoidal, smooth, greenish yellow; skin very thin; pulp acidulous, in 7 to 9 partitions, absolutely seedless."

For some unaccountable reason it appears that this variety did not gain much popularity in Europe since the time of Risso; at least it is not offered in the trade at present and no mention of it is made in any of the catalogues which I was able to consult, except one issued in Algiers in 1889, where it is given as originated at Valencia in Spain.

Whether our California trees are really identical with that described by Risso, it remains to be seen. If they were, I doubt much that our Eureka orchards are going to be budded to seedless in the near future.

THE SEEDLESS LEMON.

By G. W. Waterbury.

The seedless lemon is now a reality and another article of fruit has been added to the California list of seedless. The orange, the pomelo, the apple and now lemons can be produced and reproduced without seeds. What has been possible with these will undoubtedly be true of other varieties in the future. Sports will be produced from time to time which will form parent stocks for old varieties of fruit under new and better conditions.

In quest of the seedless lemon I visited Rialto, in company with Mr. W. C. McCully, manager of Mr. Flagler's ranch in Corona, last week. At Rialto we picked up Mr. H. C. Livingston, an authority on both Florida and California citrus stock, and drove to the citrus ranch of Mr. Henry Meyers. Mr. Meyers owns ten acres of oranges, along one side of which are 14 lemon trees planted over ten years ago.

Of the lemon trees 13 were of the new seedless variety and one Lisbon. The trees had not been pruned and on account of their proximity to the road had not received proper cultivation. Nevertheless, under such unfavorable conditions, the seedless trees had produced over five boxes to the tree a year and the physical condition of the tree was fairly creditable.

Mr. Meyers told me the stock originally came from San Diego County and was purchased as citron. Three orchardists received plantings: Mr. John Morris, Mr. W. A. Meyers and Mr. Henry Meyers. Repeated cuttings from different trees failed to show seeds. The fruit was full of juice, but the rind a little thick and a trifle coarse on the outside. The inner portion of the rind was of a little more pulpy appearance than in the seeded lemons.

The condition of the rind I attributed to the poor cultural conditions under which the trees had grown. Mr. Livingston stated that none of the Sicilian lemon stock he had received and handled while in Florida had ever been seedless and did not believe the parent stock had been propagated there. Both he and Mr. McCully believed the tree would do well in Southern California.

Later, in company with Mr. Martin of Rialto, we visited another grove planted to both oranges and lemons of mixed varieties. Here I found a number of seedless trees, growing under much better conditions and showing highly satisfactory results. The tree is thornless, a good bearer, carries more wood than the Eureka and hangs well to the ground. In spite of its uncertain parentage it bids well to become one of the best of our lemon varieties; perhaps the best. Who knows?

THE SEEDLESS LEMON.

In the issue of November 30th we referred to lemons left at this office by Mr. C. H. Brown, making some comment as to their seedlessness. One point we made was that a Eureka lemon grown on a tree in thrifty condition and "picked entirely green is usually seedless or contains only unmatured or partially formed seeds." This was a point we had raised once before with Dr. J. Eliot Coit and he stated that it was a claim unknown to him. We will say, however, that it has been the belief of many who have had to do with the picking of lemons, but now after some weeks of observation, Dr. Coit writes us as follows:

"Some months ago in answering an inquiry in the Cultivator you took the position that one of the factors, perhaps the chief factor, influencing formation of seeds in lemons was the age at which the lemon was picked from the tree. You later stated to me in your office that it was your impression gained from general experience in the packing house that lemons picked green and ripened in the house were mostly seedless, while lemons permitted to ripen on the tree and fully mature before being picked were sure to be a 'seedy lot.' At the time, I questioned this, and I have taken occasion recently to cut and compare the seed content of quite green immature lemons with yellow tree-ripes. I find that there is practically no difference; what slight difference there is, is in favor of the green lemons for the most seeds. It may be true (I hope to prove this point later) that the time from blossom to coloring of seedless lemons is less than the corresponding time with seedy lemons."

We may add further that the lemons sent in by Mr. Brown were submitted to Mr. Roeding, and while he commended highly the quality of the fruit, said the shape would prevent it from grading as high-class. There were two varieties; one named unequivocally the sweet lime. Mr. Roed-

ing also brought into the office specimens of the Bearss, a seedless lemon which originated in Porterville eleven years ago. This is remarkably fine in quality, but like the others spoken of, too round or orange shaped. The sweet seedless lime was also a fine fruit, but very small. Both fruits are being propagated at the Roeding and Wood Nurseries near Whittier. While the seedless lemon has much in its favor, it is doubtful if the Eureka or its more seedy brother, the Lisbon, will ever be entirely replaced.

TO DEMONSTRATE FRUIT HANDLING.

The Florida Citrus Exchange was represented in the state argicultural demonstration train which left Palatka for a tour of Florida Nov. 16 by a special car. In this car were displayed various sizes and grades of oranges and grapefruits and all the paraphernalia necessary to the proper picking, packing and handling of the product.

The Coast Line is furnishing the equipment for this train. The car which is used by the Exchange was loaded by expert fruit packers. It made the southern trip with the train and will then return as far north as Ocala.

Exchange Manager Temple believes that much good will be done through the Exchange exhibit. Large views of interiors of packing houses in Florida are at hand and will be on display in the car. These will show good, bad and indifferent packing houses. Also will be shown white fly fruit, washed and unwashed, and the difference existing in fruit that has been washed properly and that which has not been washed at all or half washed.

Oranges secured from the Florence Villa, Winter Park, Tavarese and Tampa packing houses will be shown. The grapefruit display came from Manatee County, Florence Villa and Miami. Grading methods employed by the Indian River Association at Mims and at South Lake Apopka were shown.

At one end of the car boxes will be loaded and stripped to demonstrate the proper method of loading and stripping boxes in cars. The Exchange has received a great many inquiries from small associations and small shippers asking for information as to the proper manner of loading and stripping.

Samples of gloves used in picking, grading and packing, picking baskets, field boxes and the kind of springs used on wagons in conveying fruit are shown. Incidentally, the Exchange stipulates that all fruit for it must be handled by wagons having springs. Through this provision much unnecessary jolting and jarring of fruit is prevented.

An expert packer is to accompany the car, and he will be in charge of all demonstrations. Thomas B. Quinby, of the Exchange, will be on hand as a general encyclopedia of information, and will be prepared to answer any question presented.—Florida Grower.

OLIVES IN SANTA BARBARA.

Regarding the olive output in Santa Barbara County Commissioner Beers reports:

"The crop is coming somewhat later than last season, but the first are being gathered and the outlook is for an average crop of good sized olives. Prices are stiff, quite a bit better than a year ago, with a good demand. The use of the processed olive in the home is constantly growing and this office is receiving calls for the processing formula from those who are making their first attempt at curing the fruit. The acreage is constantly being extended and the industry seems to be on a firm footing."

CLEAN UP NURSERY STOCK.

State Horticultural Commissioner Cook is sending the following letter to the nurserymen of the state:

"For some time the state commissioner of horticulture has realized that many of the nurseries scattered throughout the state are affected to a greater or less degree with injurious insects and plant diseases. Such conditions ought not to exist in this, the foremost horticultural state of the Union, and it is the intention of the state commission of horticulture to aid in correcting these conditions as far as possible.

"As the law now stands, there is practically no difference between the treatment of pests already established in the state and those not so established. Both classes of pests are alike inimical to the horticultural interests, and both alike ought to be extirpated. In the matter of the enforcement of the law, the ultimate interests of both the grower and the nurseryman are the same. Under the law, it is the duty of the state commissioner of horticulture, who is also the state quarantine officer, and the quarantine guardians, of whom there is one in each county, to declare and enforce a rigid quarantine on any infested orchard or nursery.

"With the quarantine order in force against it, a nursery would be absolutely powerless to move any of its stock. The state commissioner does not desire to be forced to bring about this condition in any nursery, but unless the infested nurseries are made clean, he will have no other course of action."

PACKING ORANGES IN PALESTINE

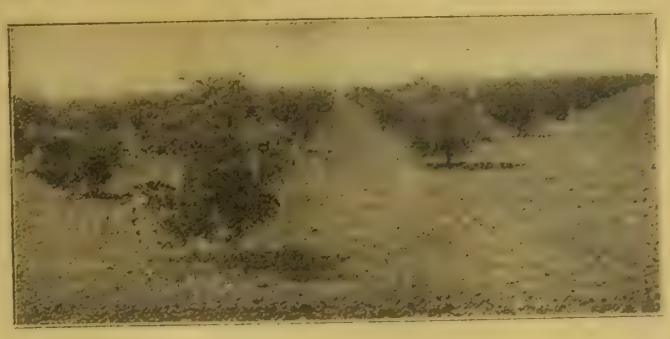
By Consular Agent Jacob Hardegg, Jaffa.

The boxes used in the orange trade at Jaffa are 68 centimeters (26.77 inches) long, 32 centimeters (12.6 inches) wide, and 27 centimeters (10.63 inches) deep. One partition is used. The thickness of the ends and the partition is 16 millimeters (0.63 inch); thickness of sides, 7 millimeters (0.315 inch); thickness of tops and bottoms, 7 millimeters (0.276 inch). The empty case weighs 4½ kilos (9.9 pounds), and the contents 33 kilos (72.75 pounds), the total weight of the packed case being 37½ kilos (83.65 pounds). The weight of the contents probably varies slightly.

The cost of the wood used in the box making, c. i. f. Jaffa, is as follows: Ends (16 millimeters thick), 60 francs ($11.58) per cubic meter (35.316 cubic feet); sides (8 millimeters thick), 80 francs ($15.44) per cubic meter; tops and bottoms (7 millimeetrs thick), 70 francs ($13.51) per cubic meter. The lumber is imported chiefly from Austria and Roumania.

Some dealers import the wood ready sawed to the sizes required, the prices being the same as unsawed. Most of the dealers, however, prefer to have the sawing done locally, as when the wood is imported ready sawed they state they suffer loss from damages and theft. The charge for sawing wood to sizes required is 10 francs ($1.93) per cubic meter at Jaffa. As a rule, dealers have their boxes made by local workmen, the cost ranging from 60 to 70 francs ($11.58 to $13.51) per 1,000 boxes. The shipments from Jaffa last year amounted to about 1,000,000 cases of oranges.

J. W. Jeffery, at the head of the new Deciduous Fruit League, is calling meetings in various parts of the valley. It is to be hoped that the deciduous people will make this organization exceptionally strong.



Citrus Trees Exclusively

We have to offer for planting season of 1912 an excellent stock of strictly first-class Citrus trees in all varieties.

REMEMBER, MR. PLANTER, we have had twenty-one years of experience in the successful propagating of Citrus trees, and while our prices might be a little higher than our competitors, we absolutely guarantee our trees true to name. We are in the business to stay; hence, can back up what we say.

THINK WHAT THIS MEANS TO YOU. The average nursery is in business today and out tomorrow, so you have no recourse should anything go wrong. In addition to guaranteeing our trees true to name, we select our buds only from best individual fruiting trees, which would eliminate the possibility of having non-fruiting trees, or poor bearers in your grove. We follow the same plan of bud selection as the government experimental work.

Our trees are all budded from 3 to 7 inches above the surface of the ground, which will eliminate any possibility of planting the bud union below the surface of the ground.

Our booklet, entitled "Citrus Fruits," mailed to any address on receipt of 25 cents; credit given for this amount on first order.

Write us today for prices and information. All correspondence most cheerfully answered.

San Dimas Citrus Nurseries

SAN DIMAS, CAL.

Good Citrus Trees

Expert grown, large, clean stock, up to size now, for 1912 spring delivery. None better anywhere. Our buds are selected with greatest care from best individual fruiting trees and positively guaranteed true to name.

250,000 Seed Bed Stock

Sour, Sweet or Pomelo—the ***McMillan grown*** kind—large clean plants from selected seed—the kind it pays to plant. Inspection and correspondence invited. Closest nursery to Los Angeles. Alhambra car.

The Law and the County Commissioner

By H. P. Stabler, Horticultural Commissioner Sutter County, Before the State Fruit Growers Convention

Enforce the law. If the law is a good one there is no reason for its non-enforcement. If it is a poor law, or ineffective, its enforcement will soon disclose its weak features and it can be supplanted with better legislative enactment. A good law not enforced accomplishes nothing. As all county horticultural commissioners are now under bonds to properly perform their duties what excuse can be given for not enforcing the law?

Better for All.

Strict enforcement of the horticultural quarantine laws of the state is better for the fruit grower, better for the nurseryman and better for the consumer. It is better for the grower because it simply requires him to eradicate the pests and diseases, which if allowed to continue on their wayward course, would ultimately ruin his property. It is better for the nurseryman, because it requires him to sell clean stock, which saves him the expense of disinfection or rejection at the point of destination. It is better for the consumer, because it makes it possible for him to buy clean fruit, which increases consumption.

If the foregoing is true, and I maintain that it is, why is there any question about the advisability of enforcing the law? In the first place, the lot of the county horticultural commissioner is a hard one. He not only has to fight the pests, but too often the grower and nurseryman whom he is trying to help. In too many instances we find growers careless, prejudiced and ignorant, while the consumer is indifferent, and we all realize the stubbornness of some nurserymen. Again we find county commissioners who are peace-loving and believers in the doctrine of moral suasion, missionary work, and publicity. While these means of accomplishment are not to be entirely disregarded they cannot be depended on to eradicate pests and diseases. They are effective only when accompanied by a final enforcement of the law.

Moral Suasion—Nit.

The writer tried moral suasion, missionary work and demonstration in the Sacramento Valley in 1904. Prof. Pierce was notified and sent directions for its control. This was published in the local papers and bulletins distributed among the pear and apple growers. Some work was done. The next year Prof. Waite of Washington and Prof. Smith of the University demonstrated, with their assistants, a successful means of pear blight eradication. We published their method as a bulletin and it was widely distributed. One of Prof. Smith's assistants was employed as an inspector and demonstrated pear blight work to growers. Personal solicitations and entreaty followed. Some growers did the work properly and secured results. Others did it in a careless way, or neglected it, and the result is that we still have some pear blight in Sutter County. It is the intetion of the commission to enforce the law in Sutter County this season. Remember, this work was carried on in an important pear and apple growing district.

Legal Suasion Works.

Contrast the manner of handling the outbreak of the white fly in Marysville. In the spring of 1907 the Aleyrodes citri was discovered in Marysville, a city not in a citrus district, and in the door yards of people who were not growing oranges commercially. Moral suasion was invoked and resulted in some denudation. Missionary work was tried followed by more denudation. Even demonstration failed to convince the owners of orange trees of the importance of the work in hand. As a last resort it was decided that the law should be strictly enforced. Legal notices were regularly served and more trees were treated, but still some owners persisted in their do-nothing policy. A suit was brought, and the commissioner was not only upheld, but the decision of the court was so sweeping that every tree was immediately denuded of foliage. The result was that A. citri was absolutely controlled in Marysville. If here have been two or three suspicious cases since, no one has objected to the enforcement of the law. How much better to follow this method than to worry along for several years under moral suasion to find in the end that enough growers have been careless and the pest or disease has been spread to other districts.

"Please" Won't—"Must" Will.

Other public officials do not depend on moral suasion and missionary work. Let me cite the county tax collector. What percentage of the public funds could he collect if he simply asked the taxpayer to please pay his taxes? He might say, "Mr. Jones, the county really needs the money, and I have been appointed by the people to attend to this matter. The law requires it, and I am under bonds to do my duty." Mr. Jones might reply, "I don't know whether I will pay my taxes or not. I hear so much about this every year I am tired of it. I don't believe in taxes anyway." But the tax gatherer simply enforces the law. Mr. Jones expects nothing else, with the result that the delinquents are very few. Even they are provided for and their taxes are paid and the state takes a lien on the property.

All of which goes to prove that the county commissioner is justified in strictly enforcing the law. The grower will soon learn that there is nothing else to do but clean up, and he will do it, or it will be done for him and he will pay for it. The nurseryman will learn that he can only ship clean stock and he will do it. The consumer will learn that all fruit offered for sale is clean and he will buy more of it.

Discretionary power is given the commissioner, but not the grower. The time has passed when a fruit grower, nurseryman or any one else can conduct his business in a manner injurious to others. When he deems it necessary the commissioner can cause an inspection of orchard, nursery or other place to be made and he can compel an attempt at least to be made to eradicate pests and diseases. Why not do it?

LOW HEADED TREES.

During these days when some advancement is being made in our orchards along more scientific lines, one often hears arguments against some of the things proposed and practiced by some of our best orchardists. One of these is against the low heading of fruit trees.

By a high headed tree we mean one whose branches come out of the main trunk four or five feet above the ground, or, as the writer heard one man say, "high enough so that you can get a horse close to the tree in cultivating." By low headed trees we mean trees headed near the ground, depending somewhat upon the variety. Peaches in one of our best growing peach sections are headed practically at the ground, while apples are headed from twelve to eighteen inches above. It is, of course, possible to allow the fruit bearing wood on what was at first a low headed tree to be several feet from the original head, but with proper pruning from the start this trouble can be easily overcome.

An apple tree that is headed high is, in some respects for practical purposes, anything but high; for example, the chances are that such a tree will have the lower branches, at least, growing at almost right angles to the trunk, or, in other words, in a horizontal position. When such a tree is bearing a heavy load of fruit, these limbs will break down and are very likely to break unless props are used. The use of props in an orchard is at best a sign of very poor orchard management in the past, and should be avoided. It is possible to train the high headed trees so that the branches will have more of an upward growth, but it is a recognized fact that work done several feet from the ground is never as satisfactory as when done from a short ladder or while standing on the ground.

In a low headed, well trained and pruned tree we have all the essentials for a profitable one, other things being right. We have a tree that is easily managed in regard to pruning, spraying, thinning and packing. Good labor for doing these things is always at a premium, and it goes without saying that the amount of time it takes for such an orchard is less than for a high headed one. In the second place, it is a well known fact that low headed trees are far less subject to sun scald than high headed ones.—Farmers Review.

APPLES AS MEDICINE.

Economically the apple is composed of fiber, albumen, sugar, gum, malic acid, gallic acid, lime and much water. Furthermore, the German analysts say that the apple contains a larger percentage of phosphorus than any other fruit or vegetable, says a physician. The phosphorus is admirably adapted for renewing the essential nervous matter, lecithin of the brain and spinal cord.

For people of sedentary habits, whose livers are sluggish in action, the acids of the apple serve to elimin ate from the body noxious matters which, if retained, would make the brain heavy and dull, or bring about jaundice or skin eruptions and other allied troubles. Some such an experience must have led to our custom of taking apple sauce with roast pork, rich goose and like dishes.

The malic acid of ripe apples, either raw or cooked, will neutralize any excess of chalky matter engendered by eating too much meat. It is also a fact that such fresh fruits as the apple, the pear and the plum, when taken ripe and without sugar, diminish acidity in the stomach rather than provoke it. Their vegetable salts and juices are converted into alkaline carbonates, which tend to counteract acidity.

MORNING GLORY.

A writer in the Healdsburg Enterprise, Mr. J. M. Alexander, does not seem to be influenced by the usual Christmas spirit which pervades the earth, and thus expresses himself regarding one of the plants of the earth put here to test man's grace. He says:

"For the small leaf morning glory more- drastic measures will be re required. The roots of this dwarf plant usually extend entirely through the earth and are fastened on the other side with a nut, which of necessity has to be unscrewed and removed before the plant roots can be drawn to the surface. These roots reach out in a network of many thousands, and are easily recognized by their innumerable 'adventitious' buds. The buds should be destroyed. Then unscrew the nut and draw the roots through the earth and bury them in a bed of quicklime. By this means a small plot of morning glory may be retarded in its growth during a single generation. This method is not guaranteed, for life is too short and 'dust to dust' was not spoken of the morning glory."

The Farmers Co-operative Produce Association of Wilcox, Arizona, recently met and elected officers for the coming year, and planned for the making of exhibits of Arizona's products.

MISTAKES IN DISTANCE.

Scattered all over the country are thousands of orchards that have been planted too closely and what they need is thinning out to give room in the air for the foliage and room in the soil for the roots. Hard as it may seem to deliberately cut out half the trees in a bearing orchard it is often the most sensible thing to do. Indeed it is often the rankest folly not to do it, for to allow all the trees to be injured is certainly folly and to save a part is wisdom. The net return is the thing to look at, more good fruit can be grown on a small number of trees that have a good chance and pay better than a larger amount of all poor fruit. And there are many orchard trees that have been set too far apart, say thirty feet, for profitable occupation of the ground for the first ten or fifteen years and after that they are too close. This is a most common dilemma and there is almost no economical and practical remedy, especially if the trees were set by any but the simple, square method. Removing each alternate diagonal row will remedy the evil.—Van Deman in Green's Fruit Grower.

Nitrate of soda can be used with benefit on all crops. It is immediately available and should therefore be only employed in connection with plants in an active stage of growth.

There is far too little mulching done. Small fruits, trees and garden crops are given a most favorable opportunity for attaining the highest perfection and development when their roots are covered with a thick mat of leaves, hay or other suitable material.

A good mulch keeps down weeds, and renders the soil loose, moist and porous at all times, and that, too, with little labor of cultivation.

The Ornamental Garden

SOME POINTS ON FIELD-GROWN ROSES.

By John Gill, West Berkeley.
Read at the Convention of California Nurserymen, Los Angeles, Nov. 23. 1911.

The cultivation of field grown roses in California has assumed very large proportions within the past few years. This refers not only to plants grown o their own roots but to budded stock as well, and it is only within a comparatively short time that the latter sort has become so popular that many hundreds of acres are devoted to it. Many roses are of very satisfactory growth when raised on their own roots. By this statement it is meant that they root easily, grow strongly and transplant readily. These are ideal conditions when they exist and are the only things to be considered if we would make a success handling stock after this method. Unfortunately, a majority of our best sorts only fill one or two of these essentials, and unless all points correspond the effort with that particular variety can not be deemed a good risk.

Some roses root readily, but the quality of the roots is not such that they are to be recommended for transplanting purposes. This is a serious point and one that has caused great annoyance, and it might be well to qualify here and state that this is controlled largely by the quality of soil, the plan of irrigation pursued, and the amount of cultivation given. Each contention listed here has a direct bearing on all the others, and even under the best possible conditions many kinds will not make sufficient growth of either top or root to make salable plants in a reasonable time. Many pages might be written on any of the phases mentioned here, and as one thought leads to another we will now turn our attention to budded stock.

Planting Stocks.

First of all, let us consider the proper time for planting wild stocks. This is so dependent on climatic conditions for ripening, heeling in when necessary, and lining out, that every location is a law unto itself, and local conditions can not be handled in a general way. Presuming then that the stock is made into cuttings of usual length and caliber of well ripened wood and free from borers or other pests, we will next note the soil. Roses as we all know prefer stiff, heavy loam, with good drainage. An excess of sand means that an excess of water must be used, followed always by an excess of young growth which is not prone to ripen, and an excess of dead roses after transplanting. This is the reason why so many growers have not been successful in the warm, dry parts of California where good stock cannot be grown without lots of water, always followed by the train of disasters just mentioned.

Cultivation.

Cultivation first, last and all the time during the spring and summer is the key to successful rose growing in this state and by no other method has any grower achieved anything except pecuniary loss. When the cuttings, climate and soil are right, we may next devote our attention to the planting. Always place the stocks deeply in the ground and see that the soil is packed around them firmly. Commence cultivating thoroughly as soon as the weather permits.

Choice of Stocks.

As to the choice of stocks there is quite a diversity of opinion in what should be used for the various sorts to be worked on them. Many varieties absolutely refuse to make a union with certain wild roses. Others make a half-hearted connection, and wait patiently for a good wind-storm when they may sever their irksome bonds. Some are very discriminating in one locality and not in another. Others work well on several sorts, and some apparently will not grow on anything. So on down the line, a constant study with the end always in view of finding out what is best for your particular purpose. It will be seen from this that to make a success in this division of rose growing many particulars must be kept constantly in mind, and eternal vigilance your watchword.

Budding.

After the stocks are planted and growing strongly the budding season comes around. This is another important season. The cutting of buds must be done with great care and precision and woe to the grower who relaxes his vigilance at this time. Careless help has driven many a nurseryman to distraction when he deserved a better fate. The selection of varieties and the quantity of each to be worked is another perplexing problem. The fickle public changes its wants often and without notice. The sort that is popular this season can't be given away next year, and vice versa. We are supposed to know all of this ahead of time and act accordingly. There are quite a number of so-called standard varieties for which there is always call in limited or fair quantity, but with the bulk of the different kinds it is sometimes a gamble.

About budding itself there is little to argue on, but about the mistakes made after the bud has been inserted a book might be written. Presuming that the scions are properly cut and handled and the choice of tying material right, we must pay attention to the man who ties the strings. Too many wrap too loose. Wrapping or carelessness in making a knot ruins many thousands of good material yearly. Then the growing of the stocks must not be allowed to stop. Too much stress cannot be laid on this point, whether the young stocks are to be encouraged by artificial means to shoot out quickly or not. Then the effect of a possible cold snap or a heavy wind storm taken into consideration and the young wood pruned accordingly. These two latter conditions cannot be entirely forestalled, and he is indeed lucky who does not lose a goodly portion of his crop occasionally by some of these happenings. But barring accidents and under usual conditions the buds are ready for inspection in a few weeks after budding. If all points are right there should be no failure greater than one per cent, and this has been our record for many years. Occasionally we get poor scions of some new variety from a distance and the loss is much heavier.

General Hints.

In topping the stocks the rose grower has another good chance to distinguish himself. Whether to do it early or wait until later is often an enigma, and if one was always sure of the weather, much extra work could be avoided and less danger from wind and rain. Heavily irrigated roses show little inclination to become dormant, and when dug in the fall and covered with young foliage, are in anything but satisfactory condition for transplanting. On the other hand when there has been no irrigation and the stock allowed to dry off naturally, there is no difficulty in digging, no danger of heating during transit, no drying back when replanted, and no kick from the purchaser.

Another point should be mentioned here. Non-irrigated roses can be dug with perfect safety as early as October and from that time on there is no difficulty in handling them until the first of April. This gives the grower a splendid chance to dispose of his stock at such times as best please his customers in the many parts of the country. Digging when possible should always be done with a treedigger, as the public have become quite as particular in the matter of roots as they always have been with tops.

One might ramble on indefinitely about the varieties of roses, both new and old, and the peculiar conditions favorable to certain kinds and classes, but it is not the intention to go into details along these phases, and in concluding will remind you that the demand for properly grown, fieldgrown, roses was never greater than it is at the present moment in California and although quite a few growers have

Small Fruits and Vegetables

GROWING ASPARAGUS.

By Q. A. Lobingier.

Asparagus is grown for the tender young shoots which grow in great numbers from the crowns early in the spring, and many people consider it the best of all early vegetables. It is in demand everywhere, often selling for prices that give a handsome profit to the grower. Notwithstanding large areas in suitable soils and locations, are annually added to the plantations already made, the demand keeps ahead of the supply and asparagus growing is only in its infancy. This article is not intended for the grower who wishes to embark in the business on a large scale, but rather for the small grower who would add something to the list of crops he already grows for market, and especially for the small home owner who would like to have a generous supply for his own table

In any attempt to grow asparagus, keep in mind that you cannot produce a crop in a day nor a year, and that it pays to do everything relating to the work in the most thorough manner. A bed of asparagus properly planted in suitable soil and having good care from year to year, ought to last for twenty years and still be productive. It is a rank feeder and possibly no other plant approaches it in this respect unless it is rhubarb. If therefore you would be successful, plan to plant no larger area than you can fertilize liberally.

Planting in Southern California can be done at any time between January 1 and March 31, the sooner after the first of the year the better. A good, deep, sandy loam is the best soil usually to be chosen outside the delta and alluvial deposits of our rivers, and it should be thoroughly prepared by deep plowing. If one has plenty of land, the rows can be made as much as four feet apart, marking them off with a plow and going twice in a furrow, making it as deep as possible. This will leave several inches of loose soil in the bottom of the furrow on which to set the plants, the crowns of which should be about five inches below the level of the ground. In rows four feet apart the plants can be from twelve to eighteen inches apart in the row. Cover lightly at first, not more than about an inch of soil over the crowns. As they grow, a little soil can be added until the furrows are filled level. Always use plants that are one year old. It is best to grow your own plants, the only objection being that you lose one year's time. The advantage of growing your own, is that it can be cheaply done and you have them right at hand in good condition when you are ready to set them into permanent quarters. And still better is the fact that you can select the strongest and best plants and reject the weak ones. Give the plants thorough clean culture the entire season and never allow them to suffer for water. Allow all foliage to grow until fall when it should be moved and removed from the ground and burned. To get best results asparagus must be fed with manure or commercial fertilizer and it can be applied almost any time. One good way is to open a furrow on each side of the row and after applying the manure in the furrow, turn the soil back with the plow

Where land is limited the rows must be closer together, but twelve inches is as close as the plants can be set in the row. In my own ground I have the rows three feet apart and the plants twelve to fifteen inches in the row. I cover the entire surface of the ground with manure a couple of inches deep three or four times a year and give abundance of water and clean cultivation. Salt is a good fertilizer for asparagus and can be applied any time where irrigation is used, but February or March would be a good time here. The cheaper grades of salt should be used. Kainit, a form of potash salt, is good. In small plantings a spacing of 12x18 inches can be used and by liberal fertilizing a large quantity can be grown from a very small area.

There are doubtless many cases where people would like to have a bed of asparagus for home use but cannot get the ground ready this coming spring. If such persons would buy seed which can usually be bought for about 50 cents per pound, and sow it in rows about fourteen inches apart, in good mellow soil, they would have a good stock of plants by fall and have in the meantime a chance to properly prepare the ground for a permanent bed. Sow the seed thinly; if it could be about two inches apart in the row it would need no thinning. Give plenty of water and good culture. One ounce of seed will produce about 200 plants.

This same suggestion is offered to the person who wishes to grow in a moderate way for market. For all those who can arrange to plant this present season it is best, of course, to buy the plants.

There are a number of varieties and most of them good. Many good gardeners assert that any type will produce good results in quality by giving the requisite care. I have "Dreer's Eclipse" in my garden, and nothing I have ever grown equals it in tenderness and fine flavor. Assuming you have set out plants this coming spring, do not cut any of it the first season. Every effort possible should be made to get a fine root system the first year and to this end get the plant to make all the foliage possible. No foliage, no root growth. Cut very sparingly the second year, that is, for a very limited time, as you can permanently injure your plants by cutting too long a period. The third season the bed will have reached maturity and the cutting should include every stock that puts up, and may continue as long as the market will justify, which is usually from six to eight weeks. If however the stocks begin to diminish or spindle, cutting should cease for that season, as such a condition would be evidence that the vitality of the plant was being exhausted. After ceasing to cut for use, allow all foliage to grow at will until fall, when it should be treated as the previous year. Frequent dressings of hen manure is excellent for asparagus, but care must be had that the quantity must not be too great at any one time. Light dressings and frequent would be safe.

As to marketing asparagus, growers will have to be governed largely by the custom in vogue where they sell. Many localities market it loose in boxes, the buying and selling being altogether by weight. In many places it is always bunched. Whatever the method the grower should make at least two grades so as to get uniformity in size, and if bunched, the stocks in the center should be as large as on the outside.

The best price will always come from the best asparagus offered in attractive, uniform packages, and I want to repeat with emphasis that the best asparagus can only be produced by the most liberal fertilization and cultivation.—Q. A. L.

General Agriculture

HOW NEW ZEALAND PROVIDES LAND AND CAPITAL FOR SETTLERS.

In the early days of the Colony of New Zealand, the land was freely alienated and some large properties were accumulated, but a more careful policy is now pursued in regard to the disposal of the Crown Lands.

While giving every encouragement to settlers, the government restricts the amount of land which they may individually purchase or lease. It provides further, that in the case of leasehold lands, the "unearned increment" in the value of the land shall be reserved to the state. This is effected by giving leases for comparatively short periods, at the end of which they may be renewed at rents determined by revaluation of the land.

The September number of the Bulletin of Economic and Social Intelligence, published by the International Institute of Agriculture, contains an article on "The Administration of the Crown Lands in New Zealand," from which it appears that while a large proportion of the total area of 26,714,265 hectares had been sold or granted in freehold, 7,412,901 hectares were held on lease from the Crown on March 31st, 1910, and there were still 2,538,183 hectares available for colonization.

Ordinary Crown Lands are sold or leased to settlers in a great variety of different ways, but always with restrictions as to the amount of land which each may acquire. In almost all cases, too, the settler is compelled to reside upon the land and to effect improvements up to a specified value. Thus, for instance, a settler who acquires first-class agricultural land on the system of occupation with right to purchase, cannot take more than 259 acres of such land, while he must reside upon the land for six years (or, in certain cases, seven years) and must effect improvements within six years amounting in value to 30 per cent of the value of the land.

A portion of the Crown Lands, amounting to 2,832,697 hectares was set aside in 1907 as a "National Endowment," the revenues derived from which will be devoted to education and the provision of old age pensions. Other lands will be added from time to time until a total of 3,642,039 hectares is reached. The "National Endowment Lands" cannot be sold, but are only given on lease.

With the object of providing for closer settlement, the government has been empowered to repurchase lands which had previously been alienated. If such lands cannot be acquired by voluntary agreement they may be taken compulsorily, at a price fixed by arbitration.

In the year ended March 31st, 1910, the total area of the Ordinary Crown Lands sold or leased to settlers was 533,048 hectares. Of the "National Endowment Lands" 414,598 hectares were leased and 39,586 hectares of repurchased land was leased or sold.

Besides providing land for settlers, the government of New Zealand has also undertaken to make advances of capital to them on the security of their lands. The system adopted for this purpose was described in another article, entitled "State Advances to Settlers" which appeared in the August issue of the Bulletin of Economic and Social Intelligence.

From 1894, when the system was initiated, to March 31st, 1910, the government made 25,722 advances, amounting in all to 233,591,500 francs. On the latter date there were outstanding 14,508 loans of a total amount of 141,690,895 francs. Of these loans, 11,261 were of less than 12,500 francs in amount and 3247 were between 12,500 francs and 75,000 francs, the latter figure being the maximum sum advanced to any one settler.

Even as a commercial enterprise the system has been successful, for up to March 31st, 1910, the accumulated sinking fund amounted to 2,540,700 francs and a reserve fund of 1,250,000 francs had been set aside.

DATE CULTURE IN CALIFORNIA.

(Continued from Page 673.)

the dried pollen powder in bottles and dust it on the late blooms with brushes.

Age of Fruiting and Production.

Varieties differ in time of fruiting, some not beginning to bear till six or seven years from the planting of the offshoot. The Deglet Noor is notably precocious. It usually bears two or three small bunches the third year and by the seventh year is producing six or seven bunches of from ten to thirty pounds each. Occasionally twelve or fourteen bunches are produced, but this is likely to be followed by a light crop the succeeding year.

Date trees live to a very great age. They should continue to bear profitable crops for one hundred years.

Processing and Curing the Fruit.

In the date growing countries of the Old World it often happens that a large proportion of the crop is lost by fermentation. This is caused by a wet spell of weather occurring during harvest time. This element of uncertainty was a serious drawback in California also, for the fall rainstorms on the American desert are known to be extremely erratic. Realizing this the Arizona Experiment Station has endeavored by long continued research to gain some understanding of the chemical reactions taking place in the ripening date and from this knowledge, to devise a method of artificially ripening the fruit off the trees, thus preventing losses from unfavorable weather and putting the industry on a more secure footing. It is a great pelasure to note in Arizona Bulletin No. 66, recently issued, that this line of work has been successful. Deglet Noor dates have been successfully ripened by controlling the temperature and moisture in incubators. This method with certain modifications has been used in California this year in ripening Deglet Noors. Dates thus treated of very fine quality and attractive appearance were sent to Los Angeles market and sold at one dollar a pound. Perhaps the novelty of this new California product partly accounts for such a high price. By ripening dates artificially, the opportunity is provided to thoroughly wash and cleanse the fruit and protect it absolutely from the flies which are a great nuisance wherever dates are handled in the open. It is said that imported dates are picked and packed by the Arabs in a horribly unsanitary and filthy manner, and on account of being pressed into a sticky mass it is next to impossible for the consumer to cleanse them.

Packing for Market.

One of the most attractive features of high quality dates is the fact that they are not mashed together but lie separate in the box with skins un-

CITRUS Trees

For the convenience of many of our patrons, we have established a Los Angeles depot where we will carry a full line of our own citrus trees, as well as a complete assortment of deciduous fruit and ornamental stock from the Fancher Creek Nurseries of Fresno. We invite your inspection and inquiries.

ORANGES

Washington Navel, Thompson's Improved, Valencia Late, etc.

LEMONS

Eureka, Lisbon, Villa Franca, etc.

LIMES
POMELOS
CITRON

Our citrus stock is grown under ideal soil and climatic conditions in our nurseries at Whittier, Los Angeles county, and Exeter, Tulare county. Guaranteed True to Name. Sturdy, well matured, with excellent roots. Free from scale.

broken. In this way they may be handled and eaten without soiling the fingers. The stickiness of the ordinary imported dates is one of their chief drawbacks. After incubation the dates are sorted into three grades, the first grade being the finest quality, the seconds being of good quality but slightly off color or somewhat blistered with broken skin. The third quality or waste is composed of all dates for any reason unfit for packing. These can be made into excellent vinegar.

Fancy one-pound boxes, preferably of tin with paper lining and tastefully gotten up outer wrapping add a great deal to the attractiveness of the product.

Scarcity of Offshoots of Good Varieties.

Owing to the expense involved in importing offshoots from Africa the U. S. Department of Agriculture only brought in a few palms of each variety. Offshoots from these multiply at such a slow rate that it will require a number of years before a sufficient stock is secured to plant out a large acreage. The two varieties imported in largest numbers are the Deglet Noor and Rhars. As fast as offshoots are available they are distributed by the government, one or two to a party in all parts of the date region. Of course the waiting list of applicants is already quite extended.

Unfortunately when these palms were introduced two kinds of date scale insect pests were introduced with them; the Parlatoria scale and the Marlatt scale. An effort was made to disinfect these palms on entry, but it was not successful, hence both pests became established in California. They occur only on date palms and it was soon found that fumigation was not an effective remedy. The Arizona Station has developed a method of fighting the scale with the gasoline blast torch. This treatment kills the scale but leaves the palm in such a scorched condition that it will not fruit for several years. It became necessary to scorch the trees in the oldest Deglet Noor orchard in Imperial Valley this year.

The presence of these scale pests makes the distribution of offshoots still more difficult, for county horticultural inspectors prohibit the bringing of infested offshoots into scale-free territory, and of course they are perfectly right in so doing. It is very difficult for private parties to secure any large quantity of offshoots true to name in Africa and any such shipment must run the risk of being held up by the local scale inspectors and if found infested ordered out of the state.

Growers Resort to Seedlings.

On account of these various difficulties in the way of securing adequate quantities of offshoots for planting out large acreages, growers have, for the present at least, resorted to the growing of seedlings.

In raising seedling palms about 50 per cent will turn out to be males and of the females a part, perhaps a third should be good marketable dates, a third indifferent, and perhaps a third will be worthless. To provide for this the seed are planted eighteen inches apart in rows four feet apart and allowed to grow two years. By this time any which may have shown themselves by a small bit of bloom to be males are destroyed and the rest planted in orchard form seven and one-half feet apart in rows thirty feet apart. This will allow for the cutting out of most of the remaining males as soon as their sex becomes known, and by some shifting of adjacent females a permanent orchard with the trees thirty feet apart each way will be secured. At some later date a few of the most undesirable trees may be cut out and replaced with offshoots taken from the very best trees. If desired, intercalary crops, such as vegetables, blackberries, or grapes may be grown between the tree rows for the first few years. This, of course, would be impossible in case the dates were planted on alkali land.

The question which seems to be bothering the growers at the present time is in regard to what particular kind of seed they should plant in order to secure the greatest percentage of good, marketable dates. At this stage of development this is a very difficult question to answer with any degree of certainty. Deglet Noor seeds from dates grown in Arizona or California are the most popular; partly because the pollen used in their production is known to be from males sprung from good edible dates; and partly because this variety is known to come into bearing very early. Fard seed also have produced some very fine seedlings. The writer has studied the fruit from a large number of seedling dates and it is his opinion that it is poor policy to plant any large quantity of seeds of the imported Halawi or "Golden Gate" date which is commonly sold by grocers. Too many of the seedlings, although very good to eat from the tree, are watery and sticky and do not show enough body to hold their shape and appear attractive when packed. The great majority of the seeds being planted are American grown Deglet Noors and Fards.

How to Judge New Seedlings.

When judging new seedlings the following points should be considered:

Precocity—It is, of course, highly desirable that palms give some indication of what they are at an early age.

Season—Early ripening varieties are preferable; flavor and sugar content; amount of fiber in flesh; color; packing and keeping qualities; size of stone; thickness and quality of flesh; toughness of skin. Date skin should be tough enough to stand handling, but not so thick and leathery as to be objectionable in the mouth. Amount and regularity of yield; manner of ripening—It is very desirable to have all the dates on a bunch ripen at approximately the same time. This enables the whole bunch to be cut at once and obviates the necessity of going over the tree several times to pick the individual ripe dates. It is also important that the date in ripening should soften from the apical end toward the stem. Those varieties, such as Rhars, which soften around the stem first, shatter off on the ground at the slightest touch and thus cause much loss and extra labor.

Irrigation and Forestry

SOME IRRIGATION FIGURES.

Director Durand, of the Bureau of the Census, Department of Commerce and Labor, has issued the first official statement relative to the statistics of irrigation in the United States, collected as a part of the thirteenth census. The statement is based on a preliminary comparative statement submitted by Dr. Le Grand Powers, chief statistician for the division of agriculture in the Bureau of the Census, under whose supervision it was prepared by R. P. Teele, special agent in charge of irrigation. The figures are subject to revision after more complete tabulation, but it is not expected that there will be any material modification of the totals or percentages reported.

Acreage, Equipment and Cost.

The total number of farms irrigated in 1909 in the arid and semiarid states, comprising all or parts of Arizona, California, Colorado, Idaho, Kansas, Montana, Nebraska, Nevada, New Mexico, North Dakota, Oklahoma, Oregon, South Dakota, Utah, Washington, Wyoming, and part of Texas, was 157,862, against 107,716 in 1899, an increase of 50,146, or 46.6 per cent. Between 1899 and 1909 the whole number of farms in the states mentioned increased 31.3 per cent. Additional irrigated farms, totaling 4,320, in the rice belt of Arkansas, Louisiana and Texas, and 2,228 others in the humid states, most of which were truck gardens, were also reported. The total number of farms on which irrigation was practiced in continental United States was 164,410 in 1909, against 108,218 in 1899, an increase of 56,192, or 51.9 per cent.

The total acreage irrigated in the arid and semiarid states was 13,739,499 acres in 1909, against 7,527,690 acres in 1899, an increase of 6,211,809 acres, or 82.5 per cent. In the rice states 694,730 and in the humid states 28,919 acres were irrigated in 1909, making the total acreage irrigated 14,463,148 acres in 1909, against 7,539,545 acres in 1899, an increase of 6,923,603 acres, or 91.8 per cent. In the arid and semiarid states alone the acreage which all enterprises were capable of irrigating in 1910 was 19,335,711 acres, an excess of 5,596,212 acres over the acreage irrigated in 1909. The area included in projects either completed or under construction was, in the arid and semiarid states, 31,112,110 acres in 1910, an excess of 17,372,611 acres over the acreage irrigated in 1909. These figures indicate in a general way the area which will be available within the next few years for the extension of irrigation, and show that the area irrigated in 1909 can be more than doubled without undertaking new enterprises.

The number of independent enterprises reported in 1910 in the arid and semiarid states was 54,669. The total length of all ditches was 125,615 miles, of which 87,336 miles were in main canals and 38,279 miles in laterals. The number of reservoirs reported was 6,933, having a combined capacity of 12,872,256 acre-feet. The number of wells pumped for irrigation was 14,544, and the number of all pumping plants 13,951. The engine capacity of pumping plants was 207,241 horsepower. The acreage irrigated with pumped water was 478,288 acres. Flowing wells supplied water to 125,590 acres.

The total cost of irrigation systems reported in the arid and semiarid states was $304,699,450 in 1910, against $67,482,261 in 1899, an increase of $237,217,189, or 351.5 per cent. The average cost per acre was $15.76 in 1910, against $8.89 in 1899, an increase of $6.87, or 77.3 per cent. The average cost of operation and maintenance per acre was $1.07 in 1909. The cost of all plants in the rice states was $12,877,352, making $317,576,802 the total cost of all enterprises reporting in 1910, except those in the humid states. No report was secured on cost of enterprises in the humid states, for the reason that water for irrigation in those states is usually obtained from city waterworks or other plants not constructed primarily for irrigation purposes.

ELECTRIC LIGHT ON THE FARM.

Up to the present time the practice of lighting farm buildings by electricity has not been popular. A few of the more wealthy and progressive farmers have installed private plants for this purpose, but the majority of the well-to-do farmers who have considered it at all have deemed it an extravagant luxury. While it is true that the cost of electric light on the farm is considerably above that of kerosene, considering the first cost, yet the comparison between the two is as favorable, if not more so, to the electric light as the comparative costs of an automobile and a horse and buggy are to the automobile. There is some room for argument concerning the comparative advantage of the electric light and the automobile over their competitors, the kerosene lamp and the horse and buggy, respectively, but in the writer's opinion the electric light is more a necessity and less an extravagant luxury than is the automobile. Today it is no uncommon occurrence to find in a well-to-do community every third farmer the owner of an automobile, but it is a rare occurrence to find a farmer blessed with the convenience afforded by the installation of a small private lighting plant.

The conveniences of electric light for the farm house and outbuildings on the farm are undisputed, but its practicability is not so generally acknowledged, or, I might better say, understood. In the vast majority of cases it has not even been considered. Some of the reasons for this, which appear to the writer, are as follows: First, the seemingly prohibitive cost of installation. Second, the fear of coming in contact with live wires. Third, the fear of its causing fire. Fourth, that it requires a man with electrical knowledge to operate the plant. Of the above reasons the first is the only one which can in the least be considered a reason, and it has in a large measure been removed by the advent of the "Tungsten" lamp, which has come into use in recent years. It takes approximately one-third the amount of electricity for a given amount of light which lamps prior to its advent required, and hence for a given amount of light the capacity of the necessary plant is cut to one-third that formerly required. The second reason is unfounded. A voltage higher than 30 volts is seldom used, and a child can come in contact with that without fear of injury, and an adult can come in contact with 250 volts with very little danger of serious injury. The third reason is erroneous, as the danger of fire from electricity in a well wired house is practically nil, which is more than can be said for kerosene lights. The fourth reason is without grounds, as any intelligent person can, by following the simple instructions given by the manufacturers, operate the plant with perfect satisfaction.

At present complete equipment, consisting of engine, dynamo, storage battery, switchboard and all auxiliary apparatus with sufficient capacity for the large majority of farms, can be

(Continued on Page 701.)

Bees and Their Care

HOW TO GET BEST RESULTS IN BEEKEEPING.

By J. F. Crowder.

In hiving an ordinary swarm of bees, never place them over five frames of starters or sheets, just what they can easily cover and care for; then there will be practically no sagging, buckling or melting down. On this plan the bees will invariably draw worker comb, whereas when hive is filled to its capacity with starters the outside ones will in most cases be drawn out drone comb and crooked. If the keeper is watching his bees, when the first five are practically done or the bees are wanting more comb,— which they will show by starting comb-building on the quilt or cover,—then add two other common frames by setting them in alternately through the other five drawn combs. Always put the first five to one side, never in the middle of hive, keep adding other frames from time to time until hive is full. In this way you will find hive full of good brood. Be particular to have the hive set level crosswise of the combs, but tipped a little to the front.

For Extracted Honey.

In placing the super on for extracted honey keep up the same process as in the brood chamber, by drawing out the two outside combs of the brood chamber and putting in their stead two other starters by alternating through the brood nest. Put these two combs and two full sheets of foundation (never starters) in super, alternating combs with foundation. Keep adding from one to three as the colony requires. When completed you will have a colony of bees you will be proud of.

So many so-called practical beekeepers just dump their bees into hive with its full capacity of frames, with hive toppled over to one side. In a few days they take a peek into the top, think they are ready for a super, and place the super on without looking into the brood chamber, then wait and wonder why they do not go into the super. If they should work in the super they would draw out a bunch of lopsided combs that one could not get back into the same hive.

Comb Honey.

For comb honey production bring up the brood chamber in the same way. Before adding the super, if convenient, place in a comb super at least one section filled or partially filled with honey from last season, or from another hive.

Taking Honey.

How and when to take the honey. There is perhaps no other commodity that is derived from so many sources, unlike sugar from only cane and beets, or syrups from cane and corn. Honey is produced from many different plants in all seasons of the year. So for the apiarist to handle his business intelligently he must know the source of the honey and duration of flow, whether orange, sage, alfalfa or clover. Most all sections of the state have various minor honey bearing plants from which the bees will partially fill their hives in the early part of the season. All such honeys should be removed from the supers, no matter if there is only a pound or so. When the bees bring in honey from the source whence he expects his main crop, he will get the pure product. I have seen on the market this season honey marked "Pure Orange Honey," when it was not over 40 per cent orange.

Fence corner beekeepers in this locality call their first extracting orange honey, while not over 40 per cent was from orange blossoms; the rest from hoarhound and eucalyptus bloom. I asked the trade this spring if they wanted some orange honey. They said "No, we do not like it. It's too bitter." We induced them to try a can of some that we know was pure orange. The result was from 20 to 25 can orders at nine cents per pound net. When you realize that the orange flow, or your main source whatever it may be, is over, then clean up, as the bees will swing back onto the hoarhound, etc.

Pure Product.

To get a pure article in the comb honey line is a little more difficult unless the apiarist knows his territory to a T. The super should not be put on until the actual flow is on, holding the bees down with the extractor or by proper manipulation to prevent swarming. In this way one is able to get a pure article—pure orange, pure sage, etc.

Packing and Marketing.

Properly packing and marketing honey is about half of the fight; off grades of honey command a very poor price, from four to six cents per pound, while the pure and fancy article readily moves at from eight to ten cents per pound. Packing honey is an art of itself. Always put your product in new clean packages. You will always get your money back and more. Any article that looks fancy and clean, commands a ready sale.

Many a merchant does not like to handle comb honey owing to its smeary and leaky condition; this is partially his own fault, and the packer's. The next grocery you pass just take a look at his honey displayed and count the sections that he has bottom side up. Merchants are not the only ones who turn this trick. I have known beemen to turn the section sideways, bottom up, any old way to get them to fit into the case and not touch each other, regardless of the topsy turvy condition. In this way they reach the market in a smeary condition which is disgusting to any down-to-date merchant. This dripping honey could be minimized by the producer putting the honey on shelves bottom up on dripping slats a few days before packing. Teach your merchant how to set the section right end up. You will be a great help towards educating and creating a demand for your product. But don't put your honey on the market as pure orange blossom, or pure mountain sage, when you know full well that it is nectar from many different sources, for the man who does specialize his various nectars has that fabrication to overcome in disposing of his product.

SOIL EXPERIMENTS.

Professor J. H. Norton of the Citrus Experiment Station, is especially desirous of securing at once observations of citrus fruit growers as to the effect of fertilizers, or as to the effect of different soils on citrus trees. Anyone who will send to him any data will confer a favor and it will prove of benefit to other citrus growers.

HAPPY NEW YEAR.

The year 1911 has passed into history and we are entering a new year which we hope for the readers of the Cultivator will be by far the most successful ever given to them. In many respects the old year has been very satisfactory to California producing interests. Some have found reason to complain, but we wish for those that the coming year may produce so great a measure of happiness and prosperity that it will make up for all that is past.

AGAIN LEADING

With the world's annual production of oil reaching 200,000,000 barrels, the United States produces 128,000,000 barrels. Of these 128,000,000, California heads the list with 73,010,560. This output is more than twice as great as that of Pennsylvania in her greatest glory. California and Oklahoma produce as much as all the rest of the world outside of the United States. The average price during the year in California is 49 cents per barrel.

FROSTED.

December is closing with some most disagreeable weather; it has not rained; it has been cold. The northers and other ill-tempered winds have added to the discomfort and wasted the vitality of all plant life. To cap the climax the Christmas season saw disagreeably low temperatures. What the exact damage will be no one can estimate. The orange growers are hopeful, but the low temperature all night long and coming after the extended dry weather, especially the drying winds, causes much apprehension. Some sections will be only slightly injured so that California will ship large quantities of citrus fruits. Building of fires was not as general as it should have been though many did their best. It is said that in some sections this was the coldest weather in Southern California in 24 years.

BALANCE WHEEL

An Eastern writer speaking of the farmer as a power in politics refers to the recent suffrage vote in California. The first few days after the election, the cities' reports being first in, the press conceded absolute defeat to the suffrage amendment, but returns from the farming districts completely reversed the figures. In Maine's recent election as to whether the state should go wet or dry, the first day after the election showed a vote emphatically favorable to the licensing of the saloon. Two days later the returns from the back districts reversed the count. In New Jersey the vote on the race track gambling proposition was thought favorable to the gamblers until the country's vote came in and drove them from the state. The farmer sometimes rebels at the domination of the city and again he has the satisfaction of witnessing his own ability to upset the best laid plans.

INDEX.

Over 700 pages of the size of the Cultivator makes another large book which has been handed to our readers during the past six months. We believe we have remarked that the dollar a year which purchases the two volumes of the twelve months' issues, secures a book larger than Webster's Dictionary, and we believe it is so valuable that no one engaged in farming in California, Arizona, Oregon or Washington can afford to be without it. We believe every number is well worth filing away and binding. Of course, ultimately much that is in the Cultivator will appear in book form, but for the next two years we doubt not there will be facts to be gathered from back numbers of the Cultivator which no library in the country can supply. The filing is made of more value by the index at the end of each six months' volume. The index for Volume 37, July to December, 1911, appears on Pages 700 and 701. A look over it will show that the articles appearing in the Cultivator cover a range which touches almost every feature of California's agriculture and horticulture.

FRUIT GROWERS CONVENTION

It was a great shock to the attendants at the State Fruit Growers Convention held at Santa Rosa last week when one of the representative fruit men of the state and an enthusiastic worker for the best fruit interests of the state suddenly expired on the convention floor. This was Mr. Homer Craig, President of the Santa Clara County Farmers Union. Mr. Craig has for a long time been working for the using of white labor as much as possible in the harvesting of California fruits. One of his suggestions has been the changing of vacation time in all the schools of the state so that the students can spend as much time as possible in the orchards during fruit harvesting. He had just finished the address on this subject when he suddenly passed away.

Notwithstanding this occurrence the delegates proceeded to carry out the program as arranged by State Commissioner Cook. It was a most successful convention and was very largely attended. One of the principal resolutions introduced was that urging the enactment of the national quarantine bill now before Congress. This resolution was passed unanimously, and it is hoped that it will result in calling the attention of Congress to the great need of this country. There is no such law on the American statute books, while many European countries prevent the entrance of plants or fruit without most rigid examination.

The people of Santa Rosa extended a true California welcome.

MONEY FOR RAISINS.

We have from Receiver W. R. Williams of the California Raisin Growers Association a letter in which he refers to the payment of a forty per cent dividend on account of the 1903 crop. The dissolution of the old association, while, in the very nature of things perhaps, necessary, was disastrous to the industry. Faulty as it was, if the old association could have been kept on its feet to steady the market, the industry today would be in a far better condition. Whether the present effort looking toward Exchange methods will lead out of the woods and bring prosperity again or not, we do not know, but sincerely hope it will. The mistakes of the old association should be warning of some of the rocks in the way of co-operation. As to this particular distribution, we quote from the Fresno Republican:

"Approval was attached yesterday by Judge Church to the third account of Receiver Williams, and he authorized further the distribution of $122,800 out of the cash balance on hand of $126,811.81 collected on judgments in the California Raisin Growers Association. This distribution covers a third dividend of 40 per cent on docketed judgments amounting to approximately $307,817, on which with this dividend 75 per cent will have been realized. Bookkeeper Funch began in the afternoon making payments by mail, and says that if grower creditors who cannot call at the receiver's office will send him their addresses on postal cards the work of facilitating making payments will be greatly aided. There have been many changes in addresses, and the list that he has is of residences and locations of two years ago when the second dividend payment was made."

CO-OPERATION.

The great difference between producers and consumers prices is causing continued discussion of means to bring the two figures closer together. Co-operation has been successfully worked out as a means of marketing the farmer's products, but in the matter of purchasing more is to be learned. On this point N. J. Bachelder, Master National Grange, said in his annual address:

"The marked increase in the cost of living in recent years has directed public attention to the great discrepancy between the retail prices of food stuffs paid by the consumer, and the prices paid to the farmers. As a remedy for what is alleged to be the excessive profits of the 'middleman' or dealer in farm products, the farmers are everywhere forming or preparing to form, co-operative associations for the purpose of selling their crops directly to the consumer. A large number of these associations have formed and many others are now in process of organization.

"The advantages to the farmers of combining with their fellow producers for the purpose of avoiding the payment of high charges by commission houses, and for securing more favorable freight rates, storage charges, etc., have been so manifest that it is only a question of time when the great bulk of all farm products will be marketed through some form of co-operative agency. There is no reason why the same system should not be applied to the purchase of the goods used by the farmers, so that they can buy these goods at practically wholesale prices.

"The favorable conditions for the adoption of co-operative systems has attracted the attention of professional promoters, who are endeavoring to utilize the desire of the farmers for co-operation as a means to further stock-selling schemes. Caution should be exercised by the members of the Grange in giving their endorsement to any of these associations, and the character and financial standing of the organizers should be carefully looked into before joining them. The co-operative principle is sound, and is destined to govern the immense volume of trade from the farm to the city and from the city to the farm, but there will doubtless be many failures unless great care is taken to establish real co-operative societies, conducted for the benefit of all the members, and not for the profit of a few promoters. Membership in co-operative associations should be by individual members rather than by a Grange."

Agricultural News Notes of the Pacific Coast

Northern California

There are 210 farms on the Orland reclamation project.

A fourteen hundred acre ranch near Dixon is to be subdivided.

Sonoma County's planting of prune trees will be greater than ever before.

California is producing more eggs than ever before at this season of the year.

Shortage of next year's hop crop is already predicted, as new acreage will be extremely light.

The California Almond Growers Exchange announces that practically all almonds are sold.

The Sacramento Valley claims that it will ship more than a thousand cars of oranges this season.

Hop men of Ukiah, Mendocino County, are planning to fertilize their yards before the next season.

Sonoma County's wine output for the past season has been about thirteen million gallons.

The principal part of the fall crop of the Sacramento River Delta section is being stored in the Sacramento fruit sheds.

The Cosumne Irrigation Company is completing plans for irrigation of a large body of land in Sacramento County.

The entire northern end of the state is making heavy demand on all nurseries for planting stock for the coming season.

The Alvarado Sugar Factory is to be moved and it is predicted that some section in Sacramento County will be chosen.

Some most interesting experiments have been made with water requirements of alfalfa at the University Farm at Davis.

A San Francisco produce concern has secured a corner on onions. It is claimed they have practically the entire crop of the state in hand.

The most interesting feature of the State Fruit Growers Convention at Santa Rosa last week was the consideration of the Mediterranean fruit fly menace.

The board of supervisors of Amador County is being petitioned by the farmers at Jackson to control the damage done by the Penn Chemical Company's smelter at Campo Seco.

Officers of the Grange at Napa are: Master, John Wilson; overseer, Charles Bates; lecturer, Miss Annie Graves; steward, Elza Dougal; chaplain, Mrs. C. Bates; treasurer, Dr. W. E. Alumbaugh; secretary, Mrs. Nellie Hunt; gatekeeper, H. A. Chapman; Ceres, Mrs. J. J. Swift; Pomona, Mrs. D. Bohen; Flora, Mrs. A. Martin; chorister, Miss Jessie Redfield.

The officers of Santa Rosa Grange recently elected are: John Strong, worthy master; N. A. Griffith, overseer; C. E. Wingate, lecturer; S. H. Stone, steward; C. E. King, assistant steward; Mrs. M. M. Gregory, chaplain; H. N. N. Latimer, treasurer; Miss Fannie L. Gamble, secretary; George W. Smith, gatekeeper; Mrs. Ida Wagner, Ceres; Mrs. S. H. Stone, Pomona; Mrs. A. Cary, Flora; Mrs. J. Strong, lady assistant steward; Mrs. C. E. Gamble, pianist; Mrs. R. Coulter, member of executive committee.

Central California

Some olive orchards at Lindsay, Tulare County, have netted $20 per tree.

Alfalfa growers of the entire valley are reaping immense profits from alfalfa.

Hanford, Kings County, recently shipped 1,200 hogs to the Los Angeles market.

Tulare County orange growers are estimating $1.00 per loose box as returns this year.

Celery fields in San Joaquin County averaged a thousand to twelve hundred dozen per acre.

A corporation has been formed to handle a large tract of reclaimed land in San Joaquin County.

One prune ranch near Visalia, Tulare County, yielded this last season at the rate of $417 per acre.

At the last meeting of the San Jose Grange discussion of plans for next season's fruit crops was a feature.

Lodi fruit growers recently met and discussed the interests of the new Deciduous Fruit Protective League.

The Hughson Condensed Milk Company building is enclosed and will soon be in shape to handle products of the dairy.

The first car of oranges ever shipped from Ducor was sent through the Porterville packing house last week.

Citrus growers of Tulare County are all happy over the excellent returns. Every car shipped has brought good prices.

The San Jose Chamber of Commerce is asking the question, "Why not a boulevard around the entire valley?"

An orange grower near Lindsay is suing a contractor because of alleged improper planting and care of an orange orchard.

An interesting meeting of the Santa Cruz Poultry Association was held last week. The principal discussion was on feeding.

The Sempervirens Club of Santa Clara County is making an effort for the building of a fine road into the State Redwood Park.

The firm market condition and big prices are giving Santa Clara Valley prune growers a more comfortable feeling than for some years.

The State Highway Commission met representatives of many San Joaquin Valley towns at Fresno last week. No definite route was announced.

A grape grower at Sanger has sued a buyer for $2,700 because of refusal to take his grapes after he had contracted for them at $40 per ton.

Santa Cruz County is finding its apricot crop is becoming one of the most important. Commissioner Volck has just issued a bulletin on sprays for apricot trees.

Valley dairymen who ship cream to Los Angeles market are objecting to the strenuous ordinance recently enacted in that city, but they will doubtless meet its requirements.

Horticultural Commissioner Sharp of Kings County has warned farmers to use extreme care in buying alfalfa seed. He especially urges the use of California grown product.

Southern California

Carpinteria, Santa Barbara County, has its bumper walnut crop.

Large plantings of broom corn are promised for the Imperial Valley.

For the first time, Arizona oranges have been sold from Los Angeles fruit stands.

Ethanac, Riverside County, is developing much water in new wells which have been sunk.

It is rumored that there is a great scheme on foot to manufacture fertilizer from kelp beds along the coast.

The second payment of the Lima Bean Growers Association of Ventura County aggregated seven thousand dollars.

Riverside ranchers are in arms over closed season on rabbits. They are destroying young grain and other crops.

The sugar factory management will reclaim a large tract of swamp land near Arroyo Grande, San Luis Obispo County.

Poultry breeders of Southern California are planning for a great show to be held in Los Angeles early in January.

Escondido, San Diego County, has decided to make an exhibit at the coming National Orange Show at San Bernardino.

San Bernardino County is not especially strong on raisin grapes, but little Etiwanda claims an output this year of about 400 tons.

Fruit growers of San Luis Obispo County are making the claim of having one of the best apple producing counties in the state.

A rancher near Pomona claims the world's record with a production of 40 tons of sugar beets. Some of the beets averaged 100 lbs. each.

San Bernardino offers the biggest prizes ever offered for a citrus exposition in Southern California. The show is to be held in February.

Fire wardens in Ventura County have caused the arrest of many who refused to obey the call at the recent forest fires and assist in its control.

Dairying has made great advancement in the Coachella Valley, Riverside County. Heretofore the main interests have been in vegetable gardening.

The Highgrove Orange Association has built an extensive addition, one feature of which is a fumigating room for the disinfection of orchard picking boxes.

The Redlands Golden Orange Company is having trouble in the Superior Court with the number of employes who were discharged and afterwards filed claims for their salaries.

Butter shippers of Imperial Valley are complaining to the Railroad Commission because of discrimination by the express companies. The San Joaquin Valley has a lower rate than does the Imperial.

Friends of R. S. Woglum, entomological expert, sent by the department to India in search of the parasite of the white fly, are saying "I told you so" when they read reports of his return with the bug that promised to do the work.

The Coast

Spokane is making a move for union stockyards.

Idaho is shipping its hay as far east as West Virginia.

Tucson, Arizona, is under a blanket of the heaviest snow for two years.

A $25,000 creamery and ice plant is to be erected at Coltville, Washington.

Some especially fine steers sold on the Portland market at straight 10 cents.

An orange grower near Tempe, Arizona, claims a net return of $1500 per acre.

British Columbia apple growers took forty-three prizes at the Spokane Apple Show.

The city health department of Spokane has started a war on cholera infected hogs.

The Inland Empire Poultry Association closed its most successful show at Spokane last week.

The Farmers Union at Pullman, Washington, added 21 new members at its last annual meeting.

Over a thousand fowls were exhibited at the Asotin County Poultry Show at Clarkston, Washington.

Farmers' Institutes were held in Arizona last week at McNeal, Whitewater, Sevoss, Cochise and Wilcox.

Pullman, Washington, is issuing a circular on pear blight and growers have determined to make a persistent fight on the pest.

The American National Livestock Association at its annual meeting at Denver, Colorado, elected Hon. H. A. Jastro of Bakersfield, its next president.

It is predicted that the mohair industry of the northwest will grow with leaps and bounds during the next few years. It has already proved very profitable.

The Northwest Stockman's Association held its annual meeting at Lewiston, Idaho, and elected officers for the coming year. Paul Clagstone of Idaho is president.

The livestock industry of Arizona has increased greatly during the past three years. During the year ending June 30th, 1911, the total output was 250,133 head.

The Nevada State Veterinarian reports havoc is being played with the swine in Lyon and nearby counties by hog cholera. Over a thousand hogs died within a few days.

The Oregon Wool Growers Association at its recent meeting at Baker demanded a change in the wool tariff especially that the tariff be on a basis of scoured wool.

Seattle jobbers have decided to resist the practice of California walnut growers which they claim is to bill "gross weight." We believe, however, that the walnut growers association already grants net weights.

A committee appointed by the Walla Walla convention of the Inland Empire Fruit Growers nearly a year ago has prepared a report and submitted proposed by-laws for an incorporation which it is hoped will have to do with the marketing of the fruits of the Northwest.

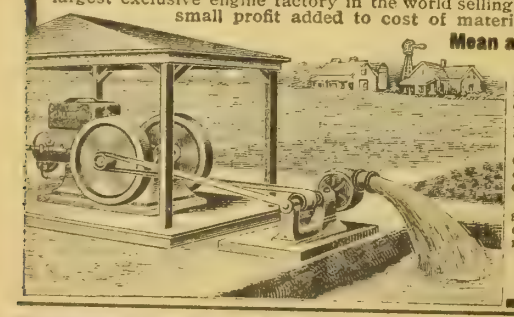
GALLOWAY

Pumping Engines and Centrifugal Pumps

MAKE the most economical and efficient pumping outfits on earth where large quantities of water are required. Galloway Pumping Engines are made in sizes to suit every purpose from 1½ h. p. to 15 h. p. They are built on honor, and so powerful, simple, economical and reliable that they are acknowledged everywhere as the most all-around satisfactory gas power possible to obtain. They are built in the largest exclusive engine factory in the world selling direct to the consumer with just one small profit added to cost of material and labor.

Mean a Saving to You of From 40 to 60%.



Galloway Centrifugal Pumps on account of the high efficiency obtained, their exceptionally simple design without valves or other complicated mechanism of any kind, are the ideal pumps for irrigation purposes or where large quantities of water are required.

A combination of Galloway Engine and Galloway Centrifugal Pump means ideal equipment at a great saving in price as compared with competitors prices.

Write us for full information. We have a special department for irrigation work with experts ready to work out your requirements.

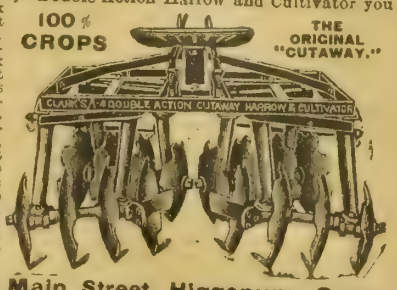
Wm. Galloway Company
1455 Galloway Station, Waterloo, Iowa

INTENSIVE CULTIVATION

HARROWS AND CULTIVATES.

With Clark's Original "Cutaway" Double Action Harrow and Cultivator you can do more different kinds of work with less effort than any other. It is the only Disk Cultivator that completely embodies the double action principle. It will do the work of several other disk machines that would cost you several times as much; do it more thoroughly, because it has 4 gangs instead of 2. Cuts the soil twice, throws in opposite directions, fills the hollows, leaves land level and true. The draft is always from the centre—suitable for light team. All single action harrows run in half lap. Gang frame adjustable for cultivating rowed crops. Jointed pole. We make a "Cutaway" for every crop. Send today for our new catalogue, "Intensive Cultivation." It's Free.

100% CROPS



CUTAWAY HARROW COMPANY 977 Main Street, Higganum, Conn.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

THE CORN PLANT.

By Mrs. M. E. Sherman.

The old cry that we cannot grow corn in California simply means that we have not tried to do so in an intelligent manner. In portions of the state corn has been grown for many years in a haphazard way without selection of seed. When it did well it was our skilful handling; when it failed, it was charged to the changing climate owing to excessive use of irrigation water of the neighbors, or else to the cutting off of the forest changing the rainfall. It is a freak of the human imagination to put all our failures on something outside of ourselves. The old-time folks used to call it the will of Providence, yet all the time they knew that the Heavenly will was that man should be perfect in himself and in his ways. What humbugs we are to deceive ourselves. Now climate in California is all right, even the heat of Fresno and Imperial are good assets, if used as they should be to increase the agricultural products.

Climate is reasonably fixed in its variations and we can meet its conditions by carefully selecting the seed of the plants that do best under its conditions. Did you ever consider how quickly success comes in improving annual plants? Six to ten generations will fix a type. With a generation a year, six to ten years will improve an already domesticated plant to a high degree. Now what can be done with corn in a warm climate to improve the crop? That it is possible to do this is proved by a record of a corn crop grown in South Carolina that is a wonder. Now I would not quote this if it were not in a government bulletin of 1898. A record of two hundred and sixty-three bushels to an acre, that story sounds like some of the tales of the fortunes to be made in growing eucalyptus.

The work of breeding a corn more resistant to drouth is now being taken up in earnest. This can be readily done for there is already great difference in the resistant qualities shown in an ordinary field. We had a field of corn just about ready to tassel out when the head gate of the canal washed out. Now at tasseling time corn should receive a heavy irrigation to set the crop of ears well. That corn field went three weeks without a drop of water; only one-third of it rallied when irrigated again. That third produced as much corn as usual. Had the seed from this corn been saved and the next year a purposely made drouth occurred at the tassling time, the resultant seed would have shown a greater degree of resistance than that of the first year. Little by little corn can be trained to resist hardships.

The corn plant as we find it in the Middle West is at home in a humid atmosphere of sixteen or more inches of rainfall during the growing season, with a daytime temperature of seventy to eighty degrees, with a night temperature of twenty to thirty degrees less. Now we need a corn plant that will grow at a temperature of one hundred to one hundred and five and in great dryness of atmosphere without blasting. Some of these qualities have already been bred into the corn of the Great Valley. The toleration of heat is good if it does not go over a hundred with hot winds just at the time of the blooming. When corn is not right at the tasselling period it will stand any heat we have ever had, most proudly. Hot winds with a very high temperature seems to dry the pollen up before it reaches the ear of corn or rather the embryo that will make the kernels of the ear of corn. This is commonly expressed by saying that the corn will blight if the silk is dried up by heat too soon.

The critical time of tasselling is often safeguarded by the time of planting. The intense heat comes in short snaps of rarely more than three days' duration and falls in the average years, after the fifteenth of June and before the middle of August. After the fifteenth of August the nights are long enough to temper the heat of the day time. If the corn is planted early we can count the days to tasselling as under sixty-five if the corn matures in one hundred and thirty days. By later planting we can escape also the blasting of the ears. We do not, however, secure as heavy a forage in the later planted corn. It is safe to plant corn from March to July tenth in our part of the country (Fresno). The late planting of corn should be considered as good only where the water supply holds until the middle of August or to September first.

Any one may improve the seed he is using in a simple way without sets of rules for scoring. In our corn we have the resistance to heat and drouth somewhat established and wishing to increase the ears and leaves we tried the following simple plan with good success: Fifteen years ago a yellow dent corn called Legal Tender was used as the improver. We have a corn planter that sows from two separate hoppers, one over each drill. The home grown corn was used in one hopper and the eastern seed in the other one, making alternate rows of each kind. The field was cared for in the ordinary manner until tasselling time, then a careful man was sent through it to pull out of the corn on plants from the home grown seed every tassel. This stopped them from pollinating but left the eastern corn to become the fertilizing element. Then the rows of eastern corn were looked over and whenever a weak-growing stalk was found it was detasseled as well. One year's crop raised from this crossing increased the silage corn two feet in height and put two ears on nearly every stalk. We rested content with this seed for a few years and then repeated it, using Leaming, as we could not get Legal Tender seed. Since then we have once more crossed the seed corn in this way with Reid's Yellow Dent.

This selection was not for improving the ears or grain, but along the line of general improvement of the entire plant. The yellow dents are the best for us, we have concluded, as they seem to have better roots, and if the irrigation water gets loose the yellow stands up where the white falls over and is lost.

In Florida there are two kinds of corn that are worthy of our attention as a cross on the corn we now have, the Blitch and the Poorland. The Blitch is a Yellow Dent of a fairly reg-

GOMBAULT'S
CAUSTIC BALSAM

A safe, speedy and positive cure for

Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a HUMAN REMEDY for Rheumatism, Sprains, Sore Throat, etc., it is invaluable.

Every bottle of Caustic Balsam sold is Warranted to give satisfaction. Price $1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

ular type. The ears from cobs having a pinkish tinge are regarded as giving the best results for seed. The Poorland is a corn that grows well on the drier, sandy soil and stands intense heat without shrivelling badly.

No, do not think that corn cannot be grown well in California. We need it too badly to balance with the alfalfa not to make a supreme effort to breed a corn that will meet the conditions of climate and heat.—M. E. Sherman.

TEXAS FEVER TICK.

The well-known transmitter of splenetic or Texas fever of cattle, Margaropus annulatus, Say, in importance far exceeds any of the other ticks found in this country. It has received attention in various departmental publications, and will consequently be given but brief notice in this paper. It is found throughout the Southern States. The original northern limit of its range in the eastern part of the country corresponded rather closely to Mason and Dixon's line. The work of eradication which has been undertaken recently has reduced the infested area considerably. Closely allied forms occur in other parts of the world, where they transmit diseases of cattle which are very similar to, if not identical with the splenetic fever which occurs in this country.

This tick causes a direct loss of at least $40,000,000 a year in the United States; indirectly the damage is much greater. Although primarily a factor connected with cattle raising, the importance of this species extends far beyond that industry. It practically inhibits the proper utilization of livestock and thus prevents a rational system of agriculture. In this manner the whole structure of the South is affected and its development held back. A better system of agriculture and rapid development are sure to follow the eradication of the tick.

There are two peculiar features of the life history of this tick. It is practically restricted to cattle as a host, and it does not fall to the ground for the purpose of moulting. These two peculiarities render the control of the fever tick a comparatively simple matter. Its failure to exist on other hosts renders it practical to free areas of its infestation in a comparatively short time by the simple device of keeping the cattle out. Likewise the dipping or greasing of cattle is a certain and economical method. Both of these means are being practiced by the Bureau of Animal Industry of the Department of Agriculture, which has undertaken extensive work which will ultimately relieve the South of a most important obstacle to development.—U. S. Dept. Year Book.

COOPERATE.

There are three important reasons why the small independent farmer cannot get the best prices for his products. In the first place, he has but a small amount of any one thing to sell, and it makes very little difference to the dealer whether he gets his small business or not. In the second place, the dealer who buys his products must also buy from a number of other small farmers, with the result that what he gets in any community is, as a rule, not uniform, and must sell as mixed stuff and at a low price; consequently he cannot pay as much as in many instances the product of the individual farmer is worth. The third condition is that, as a rule, the small farmer has his product at a town or terminal market where, if he does not sell, he is under considerable

A New Way to feed Alfalfa

HERE is the way to feed Alfalfa so as to produce two to six pounds more milk per cow a day—feed it with Steam Dried Beet Pulp

Alfalfa-fed cows are simply ravenous for Steam Dried Beet Pulp—a fact full of significance to the dairyman who studies his herd and pays close attention to feeding problems. He soon learns that alfalfa, though rich in protein, is deficient in carbohydrates, the element which Steam Dried Beet Pulp supplies. Cows, like mankind, crave variety in their feed, and they show their appreciation of Steam Dried Beet Pulp in the ration by giving a largely increased milk flow, with a higher per cent of butter fat.

Steam Dried Beet Pulp is light, bulky, succulent, easily digested, helps the digestion of other food, absorbs water quickly, swelling when moistened to six times its original bulk.

STEAM-DRIED BEET PULP
Just Like Roots
Makes More Milk

It is cheaper than bran or rolled barley and greatly outclasses them as a milk producer.

Steam Dried Beet Pulp is the clean beets from which the sugar factories have taken out the sugar, *dried by steam*. Steam drying insures clean, pure pulp, uniform in quality, appetizing in color. It is never blackened by smoke, never burned, keeps indefinitely. Packed in 100-pound sacks.

Your dealer should supply you and give you facts about this feed that is increasing the milk and butter production of the country. If he will not, write us, and we will see that your needs are supplied.

DE LAVAL
CREAM SEPARATOR

Now Is the Time to Buy and Start the New Year Right

There is no good reason to defer the purchase of a DE LAVAL cream separator until Spring. On the contrary you may buy one now and save half its cost meanwhile. Moreover, if you can't conveniently pay cash you can buy a DE LAVAL machine on such liberal terms that it will actually pay for itself.

As to YOUR need of a centrifugal separator, if you have the milk of even a single cow to cream you are wasting quantity and quality of product every day you go without one. This waste is usually greatest with cold weather and cows old in lactation, and it counts most, of course, when butter prices are high. Then there is always the sweet skim milk and saving of time and labor in addition.

When it comes to a choice of separators DE LAVAL superiority is now universally recognized. Those who "know" buy the DE LAVAL to begin with. Those who don't replace their other separator with a DE LAVAL later—thousands of users do that every year. If YOU already have some other machine the sooner YOU exchange it for a DE LAVAL the better.

Why not start 1912 right in dairying? TRY a DE LAVAL machine for your own satisfaction if nothing else. See the nearest DE LAVAL agent or write us direct and we'll do the rest.

expense to hold his product or to get it back to the farm. By cooperation farmers can produce uniform products. By cooperation in selling they can offer for sale large quantities which will attract buyers; and by bringing the buyer to them they can either sell their product for what is offered or hold it on their farms until a better price can be obtained. What cooperation has done for the butter trade it can do for other products.—University Farm News.

HOG KILLIN'.

By Charles Dillon, Kansas State Agricultural College.

Are farmers returning to "hog killin'" day? If they are not figuring on doing this, why are so many asking for details of the system used by Henry J. Waters, president of the Kansas Agricultural College, in curing and smoking meats? Nothing more interesting has come up in recent years. Within a month the demand for this kind of information has grown with the most remarkable rapidity. Since the directions were first printed, nearly a year ago, letters have never ceased coming; but recently, since work began on a slaughter house for the college in which to work out all these details before the students—since the instituting of a course teaching this kind of work—the interest has increased amazingly. Farmers in Idaho and in Maine, in Texas and in Montana, have written asking for directions, saying they had lost their original copies. Here, a little more fully, are the rules as used in President Waters' own operations of killing and curing:

To 1,000 pounds of meat take the following:

40 pounds of common salt.
10 pounds New Orleans sugar.
4 pounds black pepper.
1½ pounds saltpetre.
½ pound cayenne pepper.

Weigh the meat and take such part of the ingredients as that is a part of 1,000. Let the meat cool thoroughly. After thoroughly mixing the ingredients, one-half of the amount should be rubbed well into the meat. Put the meat in a dry, cool place. Let it remain two weeks; then rub on the remainder of the cure and let it lie about six weeks, when it is ready to hang. In some states the meat may be put in a cellar, but only if the cellar be thoroughly dry. The rule "never in a cellar" would apply to Missouri, but in Kansas one might easily have a suitable place underground. Never use a warm or moist place.

It is important that the meat be well rubbed each time the cure is applied, and that plenty of the cure be forced into the hock end and around the joints. Less cure should be used on the thin sides than on the joints. The heavier and fatter the meat, the longer the time required for curing. The warmer the weather, the quicker the meat will take the cure. The best time to kill will be in cool weather, after Dec. 1 to Feb. 1. You can kill in November if the weather is cool, but there is much danger that it will turn warmer again. Kill at the beginning of the cold wave. You will produce the finest flavor if you give the meat two or three months of cool weather, hanging, before the warm days come. About the right size hog is 175 to 225 pounds, and 180 to 190 pounds for a handy sized ham. You should have a March or April hog.

Killing and Curing Meat.

While in general a light straw color would indicate sufficient smoking, it is always safe to try a piece of thin bacon or shoulder, to be certain that the process has been carried far enough to give proper flavor and cure. The hams may be kept one, two or three years without detriment, and will improve in flavor up to the end of at least two years. No deterioration will take place for even five years if a ham is properly cured.

Smoking should be done slowly. It should occupy four to six weeks, a little every day, and with little heat. Slow smoking gives a delicate flavor. After the smoking is finished, wrap each piece in paper, put in an unwashed flour sack and hang in a dry place.

The brine cure requires the same materials, minus the pepper. When the meat has cooled, rub it with salt and let it drain over night. Pack in a clean barrel, with the heavy pieces, hams and shoulders, at the bottom. For every 100 pounds use eight pounds of salt, two pounds brown sugar and two ounces of saltpetre. Dissolve in four gallons of water and cover the meat with it. Thin sides should remain in this four to six weeks, and hams six to eight weeks. After it has dried thoroughly, smoke as in the dry cure.

Shoulders should be cured with the hams. For eating until June 15 they are as good as ham, and cheaper.

How shall you determine just when the meat has been cured? Take one of the shoulders, saw off two or three steaks, and note the color of the lean. If the inner muscles are turning a red tinge and the outer muscles are quite red, the indications are that it is sufficiently cured. It is best to fry these steaks. If the outside is a bit too salty and the inside not salty enough, it is time to quit curing. Hang it up for smoking.

Here are a few figures showing what should be procured from a 250 pound hog:

35 pounds ham.
30 pounds shoulders.
25 pounds thick sides.
21 pounds thin sides.
30 pounds lard.
40 pounds spare rib, head, feet, back bone.
18 pounds sausage.

POISONING DOGS.

Referring to an article on strychnine poisoning which appeared in a recent Cultivator, Mr. E. C. Rand, a breeder of Scotch collies and Berkshire hogs and who is located in Santa Rosa, writes the following advice:

"A dog can be made to vomit in less than two minutes by filling his mouth with a handful of common table salt and holding the mouth closed for 30 seconds. This I have tried a number of times and have found always certain.

"This may or may not be of interest to you, but I am writing it for the good 'man's best friend'."

The white breeds of swine are the Yorkshire, O. I. C., Chester White, Cheshire, Victoria and Suffolk. The black breeds are Poland China, Berkshire, Essex and Mulefoot. The red or sandy breeds are the Duroc Jersey and Tamworth. The very large breeds are the Yorkshire, Chester White, O. I. C. and Tamworths. The very small breeds are the Suffolk, Essex and Small Yorkshire. The other breeds, including the Berkshire, Poland China, Victoria, Duroc Jersey and Cheshire, stand between these extremes in the matter of size, but mature much quicker than the large breeds.—Kansas Farmer.

Teach the plow exercise as carefully as you do the sword exercise, and let the officers of troops of life be held as much gentlemen as the officers of troops of death.—Ruskin.

Profit in the Poultry Yard

Practical poultry people who may have ideas from their experience as to methods of feeding and housing and general care of poultry will confer a favor upon the Cultivator and its circle of readers by sending in concise accounts. Mrs. Basley is always willing to answer queries, which with the experience of others should make this a most valuable feature in poultry life on the Coast. Opinions or matters of a personal nature should be omitted, but a concise statement of facts is always valuable.

PTOMAINE POISONING.

Illness due to the eating of infected foods is very frequent and the account of it is invariably written up as "ptomaine poisoning." The term in this connection is not scientifically correct, as the poisoning from foods may or may not be from ptomaines. Illness from infected foods is far more frequent than is generally supposed. There is little doubt that many indefinite infections and disturbances of the intestinal tract, ordinarily termed errors in diet, are due to the indigestion of decayed or infected foods.

It is often difficult to establish the true course of food poisoning, though, of course, it is easier when the cases occur in large numbers. When but one or two cases occur in a private family, it is much more difficult to ascertain the true cause, and then only by means of the most painstaking investigation.

The poisonings from tin, leaden and copper receptacles are infrequent and in most cases are found to be due to bacteria. The more important of the food poisonings due to bacteria, often occurring in extensive outbreaks, are the following: meat poisoning, fish and shell fish poisoning, and poisoning through cheese, ice cream, puddings, potatoes and canned goods.

The most common form of meat poisoning is that from eating the meat of animals that were diseased at the time of slaughter. In this form of poisoning the bowels are principally affected, with symptoms of vomiting and diarrhea. It is well to remember in this connection, that most of the outbreaks of this kind of meat poisoning, have been traced to the meat of calves suffering from navel infection and diarrhea, or from cows that were slaughtered because they had been infected after calving or were suffering from some intestinal or udder infection. The germ of enteritis (bacillus enteritidis) is the organism responsible in this kind of poisoning.

Then there is the poisoning due to the eating of putrefied meat. This is usually associated with the bacillus proteus and bacillus coli. In this case we have symptoms of vomiting, headache, dysentery, weakness, convulsions, pains in the back and neck, and great depression.

The third kind of meat poisoning is commonly called "sausage poisoning," and is caused by the bacillus botulinus. In this kind of meat poisoning the symptoms are those referable to the central nervous system, muscular paralysis, double vision, dryness of the mouth and throat, disturbances of the heart action and respiration. There is no fever and consciousness is unimpaired. In the first two forms of meat poisoning the symptoms appear usually in from six to ten hours, while in sausage poisoning the symptoms do not appear for twenty-four hours or longer.—Geo. H. Glover, Colorado Agricultural College.

One breed is always better than a hodgepodge.

RUSSIAN MULBERRY FOR POULTRY.

The mulberry is an interesting fruit but little known to most people. The Russian Mulberry is very hardy and for this reason is more desirable for the middle and northern states than any other seedlings, therefore, the fruit of each tree varies somewhat, but in nearly every case it is an abundant bearer of fruit not over from three-fourths to one-half of an inch long. I have seen the fruit an inch long. It is an abundant bearer and bears in an early age. The fruit ripens and falls off daily, often continuing to ripen and fall for three or four weeks.

Poultry are very fond of the mulberry, and thrive on it. It is a well-shaped and attractive tree with attractive foliage. I advise every reader to have a few Russian Mulberries growing on his place, not only for its beauty and shade but for its fruit. Many people enjoy eating the fruit, and it may be made into pies and sauces where other berry fruit is scarce.—Green's Fruit Grower.

HEN HEALTH.

We are getting a good many letters from worried poultry raisers, and three-fourths of the trouble seems to be some form of roup. Of course it is hard to keep up with the work, but it's harder to make up what has been neglected. If the poultry houses were in winter shape, now, it would not be necessary to turn the fowls out of doors stormy, windy days, plenty of exercise could be furnished indoors, good health be easily maintained and the egg basket need not be quite empty.

Shelter, sunshine, exercise, dust-bath, clean water, a good bill of fare, are the best preventives of cold and roup we know of, and to furnish these is cheaper and easier than to cure. A disinfectant in the water, occasionally a dose of salts in a warm mash, are also helpful. Don't let the vermin sap the vitality of the fowls; keep them bright and active, make them work, and diseases of all kinds will find it a hard matter to secure a lodging place.—W. E. Vaplon, Poultryman, Colorado Agricultural College.

There are many waste products that could be turned to use as poultry food in every garden.

Eggs and fowls used in the home should be credited at market prices. This is only fair.

The necessity for fresh air has led to the great popularity of the open front houses.

The germ of disease must be destroyed before the disease can be eliminated.

Ducks have become one of the best paying propositions in the poultry industry.

Plenty of exercise and plenty of good fresh air are necessary for the health of the flock.

Air-slaked lime is a valuable disinfectant in the poultry house.

COULSON'S POULTRY FOOD MADE IN PETALUMA

Coulson's Chick Food

The time is approaching when you will look for something to feed the little chicks that have just arrived. You will want something that has strength giving power and is easily digested.

DON'T THINK YOUR CHICKS WILL LIVE ON ANY THING. THEY WON'T.

DON'T THINK YOU MUST LOSE A CERTAIN LARGE PART OF THEM ANYWAY NO MATTER WHAT YOU DO. THIS IS A FALSE NOTION. IT HAS COST POULTRYMEN THOUSANDS OF DOLLARS AND SOME BELIEVE IT YET.

But the man who has used Coulson's Chick Food and didn't lose his chicks as formerly, has come to realize that there is one food that brings the chicks around in good shape for eggs or market.

C-O-U-L-S-O-N'S **Chick Food**

has been used by successful poultry raisers for many seasons. They know what it will do. They know it is the best thing they can get for the little fellows.

Now What Will You Do?

If you have used our chick food, of course you will order again. If you have not used it in years past we suggest that you get acquainted with it and learn its value.

A sack will demonstrate that you have found the right food—a food that will put money in your pocket. It is made from selected grain, seeds, etc. Many valuable properties are combined.

For a good supply of eggs use COULSON'S EGG FOOD. It contains egg-making properties not found in any other food.

Our products are for sale by all reliable poultry supply houses.

Our book, "Poultry Feeding for Profit," may be had free. It is interesting and instructive. Send for a copy.

THE CUP AWARDS.

The Sweepstakes Cup was awarded to G. L. Meadows of Hanford on a score of 30 points.

The cup for the best male in the show was awarded to T. J. Simpson, of Academy, Cal., on the 1st barred rock cock.

The cup for the best female in the show was awarded to John F. Forney of Kingsburg, on the 1st S. C. White Leghorn pullet.

The cup for the best amateur display was awarded to Dr. C. W. Kellogg, of Bakersfield.

The cup for the best display of pigeons was awarded to J. M. Hacock of Fresno.

STOPPING THE CROW.

The city council of Los Angeles is contemplating the passage of an ordinance which will withhold the privilege of poultry keeping within the city limits. The agitation which has brought about the matter has been because of the fact that many poultrymen have been careless in regard to their neighbors' feelings and have not kept their yards in the best of condition, but, more than that, the desire to make Los Angeles a beautiful city and attractive to tourists, who are disturbed by the early crowing of the rooster. Of course it must be admitted that it is a strong factor to make every city attractive to tourists, but when it is considered that Los Angeles is some twenty-five or thirty miles long and takes in much farming community, it will be seen such a step would be foolhardy, but even with the closer-in sections poultry keeping should be permitted with proper restrictions. It is presumed the ordinance will not pass, but poultry people of the city are being urged to sign petitions to be presented to the council. One will be found at the Poultry Breeders Supply House, 845 South Spring Street, Los Angeles. It is now being signed by almost everyone to whom it is presented.

LOS ANGELES SHOW.

Southern California poultry breeders are preparing for a mammoth show at Fiesta Park, Los Angeles, Jan. 4-10. There will be seven specialty judges to place the awards. This is the last great try-out of the season and there is promise of a large contingent of best breeders from Northern California. That the show room will be taxed to its limit is certain by the number of inquiries already coming in. Not only chicken, water fowl, turkeys and specialties, but a big class of pigeons is anticipated. Several high-priced birds will be entered.

Lee's Egg Maker

Are your hens laying *now?* If not, are you doing your part in furnishing proper feed. Protein—*digestible* protein—is the feeding secret. It's a simple matter to get food rich in protein, but the percentage of it that is *digestible* is the thing to consider. Lee's Egg Maker is almost a pure meat product, clean, sweet, and wholesome, and contains more protein in *digestible* form than any other meat product. Successfully replaces all other kinds of meat food at *less* feeding cost and better results. That's our *guarantee.*

Prices 25c to $7.00, according to size.

GERMOZONE

is the best health-insurance you can furnish your fowls. Indispensable as a remedy for *Roup, Colds, Chicken-Pox*, and other poultry ailments. Disease in your flock now will probably mean diseased birds all winter and poor breeders in the spring. Germozone twice-a-week tones and builds up the system, destroys disease germs, insures better and healthier stock *now* and strong, vigorous birds for the breeding season. Best guarantee *against* disease; surest remedy if disease has already taken hold. *Either tablet or liquid. Price 50c.*

Lee's goods are on sale in almost *every* town, but if yours is an exception send your order direct to us and ask for our *free* offer.

GEO. H. LEE CO.,

225 W. 2d St., Los Angeles, Cal.

Send for your *free* copy of Lee's New Poultry Book. Interesting; instructive. The "best yet."

LIVE STOCK

POLAND CHINAS.
REAL BIG, SMOOTH TYPE

Sows and gilts bred to "Greenbacks," the great Ohio boar. Gilts sired by "Greenbacks" old enough to breed. Gilts sired by "Meddler Keep," the great Missouri boar, who was sired by "Master Meddler," said to be the greatest Poland China boar living. Serviceable young boars sired by "Greenbacks" and "Meddler Keep," and whose dams, "My Peerless Illinois Sows," are among the cream of the breed. Prices very reasonable.
GEO. A. SMITH, Corcoran, Cal.

For Sale—Registered Jersey cows, heifers and heifer calves and two bull calves. The young things are sired by Brown Lassie's Advocate 80,045. He is grandson of Diploma's Brown Lassie and a descendant of Brown Bessie. Merry Maiden, Ida Marigold and others of noted merit. The heifers should duplicate the work of their ancestors, being out of high testing dams.
Also a few choice Berkshires of both sexes. Write for prices and breeding; or, better come and see them. Geo. C. Dickson, National City, Cal.

For Sale—Wright Stock Belgian Hares. Will sacrifice for quick sale. For stock of choice thoroughbred at 20c per pound, all or a part. Also some up-to-date hutches. An easy and highly profitable business, with good market. Address J. E. Gregory, R. D. 6, Box 226, Los Angeles. Can be seen at Montebello.

We have now five choice young registered Holstein bulls for sale. Handsome fellows. Stock of our breeding won at the fairs all over the state. Juliana De Kol was champion at Sacramento. Most of these bulls are either sired by her brother or are out of her sisters. M. E. Sherman, Minnewawa Stock Farm, Fresno, Cal.

Grapewild Farm Herd of thoroughbred Berkshires. State fair prize winners. Boars and sows of all ages, unrelated. Address A. B. Humphrey, Mayhews, Sacramento, Co., Cal.

For Sale—Ten head Shorthorn bulls and Berkshire hogs from best strains in America. I won silver cup for best herd at California State Fair, 1911. H. L. Murphy, Perkins, Cal.

For Sale—Pure bred New Zealand and Belgian rabbits for breeding purposes. A-1 stock, prices right. W. G. Mattjetscheck, Banning, Cal.

For Sale—New Zealand and Belgian Hare breeding stock; extra fine, healthy. Los Angeles Rabbitry, Box 251, Inglewood, Cal.

Fine thoroughbred Berkshire boars and sows, subject to registry, for sale by Geo. Roeding, P. O. Box 1310, Fresno, Cal.

Belgian Hares—Fine healthy breeding stock for sale cheap. Write for your wants and prices. J. A. Reinhart, Hollister, Cal.

Berkshire boars, 5 months old, and young pigs ready to wean. R de Groot, Aptos, Cal.

Send us a list of what you want, and we will quote prices which we feel certain will interest you. O. F. Weber Co., 225-227 East Sixth St., Los Angeles, Cal.

FARM LANDS FOR SALE.

Large Dairy Ranch—
300 acres, 3 miles from railroad station, on main county road, telephone and R. F. D. route; 40 acres fine upland, covered by large ditch; 260 acres bottom land, the finest of sediment loam, 40 acres of which is in alfalfa, 70 acres more clear, 40 raising large crops of potatoes and corn, and is particularly adapted to the growth of Bartlett pears, and 30 acres of higher bottom, the finest of hay, almond or early potato land; 150 acres of fine timber, with 4000 to 5000 cords of wood, which is worth from $4 to $6 per cord. Improvements are the best in the Modesto District, consisting of fine 7-room house, 3 large barns, blacksmith shop, granary, tank house, chicken houses, corrals, etc. This property is all fenced and cross-fenced. There is included with this ranch 9 head of fine horses, 30 head of cattle, all farming tools and a large amount of good hay. This property is capable of great development as a dairy or fruit proposition, and offers the best opportunity today in Stanislaus County. Price $27,000; $10,000 cash, balance easy time. Write us today for full particulars.
PIONEER LAND COMPANY,
Modesto, Cal.

Alfalfa or Fruit Ranch—
200-acre river ranch, with good improvements, consisting of large ten-room house, big barn, granary, cabin, windmill, tank house, etc.; easily worth $5000. Within 2 miles of railroad station and school. 50 acres of fine loamy upland, raising large crops of grain; 150 acres of fine, level sediment loam bottom land, no coarse or drifting sand, free from noxious weeds or grasses. The very finest of peach, walnut, alfalfa, potato or corn land in Stanislaus County. 100 acres of this bottom land is in wheat and will yield from 15 to 25 sacks this year. 50 acres is covered with large, scattering oaks, free from underbrush, the wood of which is easily worth $3000. The bottom land faces on the river, making it an A-1 pumping proposition, and is well protected by high bluff from wind and frost. It affords today one of the most splendid opportunities in the state for a dairy or fruit proposition. For price and further particulars write Geo. E. Brinkerhoff, Box 185, Modesto, California.

WILL YOU BUY A HOME
In one of the best colony districts of the State? We have sold many 20-acre tracts in the last three weeks to people who have inspected the land, and they pronounce the land first class and the conditions ideal.
There is plenty of water, creamery, cannery, churches, schools and packing houses.
Close to 4 Railroad Stations.
We want the right people and will make terms to suit, and, if desired, will accept part of crop each year after first cash payment until land is entirely paid for.
ORCHARD AND FARM LANDS COMPANY, 309-310 Stimson Bldg., Los Angeles

For Sale—LINDSAY ORANGE LANDS.
Eleven days before Christmas the fourteen packing houses of Lindsay sent out pay checks for the 1910 navel orange crop. Lindsay orange district had the holiday orange market all to themselves, and of course they sold at good profit.
Why not invest in some of this Lindsay orange land and get the benefit of rapidly advancing prices?
Ten-acre tracts in Lindsay, $150 per acre, on easy terms.
Choice Tulare alfalfa lands, water in abundance; any size tracts, $50 per acre up.
KIOUS-WHANN REALTY CO.,
235 Mason Bldg., Los Angeles. A4164.

170 Acres—¼ mile from R.R. station and school, $30 per acre. 100 acres in crop; more can be planted to trees or vines. Partly warm citrus soil or for winter gardening; some alfalfa land; well 50 feet deep, 10 feet across, water 8 feet from surface; all under fence; no other improvements. Terms $3000 cash, balance at 7 per cent; will not trade. Address C. F. Haney, Escondido, Cal.

For Sale—Fine ten-acre olive ranch in beautiful, healthy Ojai valley; trees fifteen to twenty years old, part budded to large pickle varieties, balance Mission. Beautiful building site with live oaks and stone foundation for house; good well and lovely view. Price $5000. Address H. E. Stetson, Nordhoff, Cal.

Choice Orange Land, Exeter District—63 acres, 3 miles south of the town of Exeter, California, three-quarters of a mile from Southern Pacific railroad station, right in the foothills, leveled, water developed on it. Write for particulars. The Phalanx Company, 513 Chamber of Commerce, Los Angeles, Cal.

For Sale—
THE ORANGE GROVE MAN.
Large list of orange groves in best districts. Seven years' experience in growing oranges.
A. W. RICHARDS,
THE ORANGE GROVE MAN,
Claremont and Pomona, Cal.

Veterinary

Answers in this column by Fred G. Matthews, M. S., D. V. M., 1232 Central Ave., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Urinary Trouble.

A gelding six years old has urinary disorder. Urine is passed eight or ten times a day. The color varies—brownish white and sometimes clear. A lump has appeared on the left side over the floating ribs. The horse has been in this condition four or five weeks and has lost a little flesh. He seems irritable, but does not appear to suffer pain.—Subscriber, Van Nuys.

Chronic inflammation of the kidneys is indicated. Clip the hair from the region enlarged and apply a mustard plaster. Repeat once each week. Have sixteen powders prepared, each containing nux vomica ½ drachm, potassium iodide ½ drachm, and sodium bicarbonate 1 drachm, and give one powder twice daily in the feed. Allow the horse laxative foods—green grass, roots, etc. Beet pulp is said to be excellent.—F. G. M.

Agricultural Notes

Because of dry weather irrigation districts of Bombay, India, are compelled to restrict use of water.

Sugar planters of Trinidad are fearing great havoc because of the palm weevil which has now begun to infest the stalks of sugar cane.

The sale of American condensed milk is decreasing in Manchuria. It is claimed the loss is due to the introduction of a Swiss product.

To secure permission to exploit any of the resoruces of Mexico a concession must first be secured through application to the department of Fomento at Mexico City.

An effort is being made in New York to consolidate a large number of concerns engaged in the manufacture of glucose. It will have a capitalization of ten million dollars.

A great blow has been given to the meat packers trust because of the refusal of England to receive bids during the time the United States Government prosecutions are under way.

Next to ordinary Indian corn, the principal crop in Natal, South Africa, is sugar cane. The output for 1910 was 82,000 long tons of sugar. The industry is increasing rapidly.

The sugar industry is increasing rapidly in the Philippines. In the Pangasinan Province the production increased from 20,000 in 1909 to 30,000 in 1910, and an estimate of 60,000 for the present year is made.

The increase in the rubber production in British India is indicated by the report from one district that for ten months of 1911 it produced 117,933 lbs. as against 22,000 lbs. for the same period of 1910.

The International Harvester Company has established a branch agricultural implement factory at Lubertsy, Russia. Owing to the great number of holidays in Russia the factory can only put in 260 full working days in a year.

Wool shipments from Argentine ports from October 1, 1910, to September 30, 1911, totaled 433,251 bales, of which 30,071 went to the United States, and from Montevideo 101,122 bales, of which 718 bales went to the United States. The total shipments were 65,257 bales greater than in the same period the previous year.

On December 1 the rates for parcels sent from the United Kingdom to the United States were reduced to the following: Up to 3 pounds, 1s. 3d., or 30 cents; up to 7 pounds, 2s. 3d., or 55 cents; up to 11 pounds, 3s. 3d., or 79 cents. The former rates were: Up to 3 pounds, 36 cents; up to 7 pounds, 60 cents; up to 9 pounds, 84 cents; up to 11 pounds, $1.08. The rate on parcels from this country to the United Kingdom remains the same, i.e., 12 cents a pound.

The imports of opium at Tientsin, China, during 1910 were only 5,733 lbs. as against 20,266 for the preceding year. The culture of the opium poppy has been entirely suppressed in North China through the energetic action of Chinese authorities. Every opium smoker must take out a license and register his name and state the amount of the drug he consumes per day. If he purchases to exceed this amount he and the seller of the opium are fined fifty times the value of the excess.

That Porto Rico is not suffering from "hard times" is evidenced from enthusiastic reports received from that island. The wave of progress that struck the country in 1910 has been on the increase. The country is strictly agricultural and sugar, coffee, tobacco and fruits make up the bulk of its products. Of these all coffee showed an increase in 1911. The sugar production showed a gain of 13 per cent for the year and the exports of this commodity amounted to about $25,000,000. The exports of sugar increased from 70,000 tons in 1901 to 323,000 tons in 1911.

Regarding the guano deposits of the Mexican west coast, Consul Edwards of Acapulco reports: Along the coast of Guerrero the guano deposits are considered insignificant, consisting solely of scattered rocks widely separated and which afford resting places for sea fowl. Near San Blas, about 150 miles north of Acapulco, I have seen at a considerable distance from shore rocks of great magnitude covered to a great depth with guano, and was informed that still farther north and along the Gulf coast guano in considerable, though not commercial, quantities might be found. I have been told, also, by a gentleman who himself made the explorations, that within less than 100 miles from Acapulco, but on the other side of the Sierra Madre mountains, there exist numerous extensive caves, into one of which he penetrated nearly two miles and in which there were great deposits of guano. Off this coast is Clipperton Island, upon which the largest deposits of guano are said to exist, but these at present are covered by a concession from the Mexican government.

GARDEN HELPS.

Geo. P. Hall, for years practical gardener and all-around farmer, with more or less experience in writing for the papers, and at the present time president and booster of the Little Landers Colony at San Ysidro near San Diego, has issued a book of 120 pages chock full of garden helps, in fact, "Garden Helps" is its name. Wm. E. Smythe, also of the Little Landers Colony, gives a foreword as to the author, after which the author plunges directly into his subject, taking up the subject of soil and its formation, classification, substance, etc., after which comes planting, with tables, discussion as to environment, etc. of crops, later a list of vegetables with specific instructions as to planting. Aromatic and medicinal herbs are treated, as are flowering plants and shrubs. An appendix with useful information of various kinds is added. It's a valuable little book and entirely from a California standpoint.

POTATO CULTURE.

The A. I. Root Co. of Medina, O., has just issued "ABC of Potato Culture." It treats of how to grow spuds in largest quantity, finest quality, with the least expenditure of time and labor. The book considers the latest improvements in cultural implements. The book is dedicated to "Boys and girls, men and women and even to old people like myself (A. I. Root) who are sometimes obliged to wear spectacles to distinguish weeds from beneficial plants." The book is in fact the second edition, the first having been issued in 1901. It treats practically all sides of potato culture through plowing and harrowing the ground, selection and preparation of the seed, prevention of diseases, culture and harvesting, storing, sorting and sprouting and methods of marketing.

KIRKMAN NURSERIES

WM. T. KIRKMAN JR.
MANAGER

MAIN OFFICE FRESNO, CAL.

Attention!

PLANTERS
NURSERYMEN

Now ready to deliver—positively the finest and cleanest stock of Deciduous Fruit Trees and Vines we have ever seen grown.

We have already booked orders for more than twenty carload lots to large planters and dealers. This season we have not lost a large buyer to whom we have had the pleasure of exhibiting our trees and vines.

We are digging about half a million trees; about half of these sold to date.

If you need a carload—or a dozen—of the best rooted and cleanest trees that care and right soil and moisture conditions can produce, it will pay you to call on us or send a list of what you will need, for our estimate.

We have to offer a very complete assortment of nearly all varieties of

Peaches Apricots Plums Pears
Apples Cherries Walnuts Figs

and other Fruit Trees; as well as all the standard GRAPE VINES; also several thousand ORANGE and LEMON Trees, and a large lot of EUCALYPTUS.

—ADDRESS—

Kirkman Nurseries

Questions and Answers

THE EDITOR AND STAFF

Plants Under the Oak.

What flowers will grow under a large live oak tree on west side of house where it has plenty of wind and shade, little sun, soil gravelly.—Subscriber, San Martin.

Unless you have plenty of water it will be hard to make any shrub or flower do well under the conditions you name. There are many shade-loving plants. In bulbs we may mention callas, ferns and montbretias. An annual is cineraria, very showy, and will bloom practically all the summer through. Cassia Artemisioides will give fine results under your conditions. Then there is the columbine, digitalis, Wandering Jew and periwinkle. The last two named will stand the most drought of any, even going a couple of months without water, but of course their foliage is brighter if given an abundance of water. It must be borne in mind that a large live oak tree will soon exhaust all the moisture of the soil unless it is continually supplied.

Fruits in Owens Valley.

What kind of peaches, cherries and grapes do best in Owens Valley? Also will Thompson seedless grapes succeed?—Subscriber, Salinas.

Mr. George C. Roeding of Fresno has recently been all over the Owens River Valley so we appealed to him for help for we know he went especially to determine as to possibilities of that section from a horticultural standpoint. He writes:

"It is only a short time ago that I made a trip into the Owens River Valley for the purpose of seeing the country and to determine for myself just what its possibilities were from a horticultural standpoint. It is not necessary for me to go into detail as to the best varieties of peaches and cherries, for that matter, because in my opinion all the commercial sorts which grow in other sections of the state will do well there. Much of this land is unusually fertile and this in conjunction with their cheap water which is located on the lands at almost a nominal figure, should place this section in an advantageous position for the production of many varieties of fruits, including many varieties of berries, which cannot be grown in the warmer sections of California. The berries which I refer to particularly, which will not grow in the interior valleys, are currants and gooseberries. I have every reason to believe that this section will grow very fine strawberries, raspberries, blackberries, all of which on account of their late spring, would supply a market when all the berries from the warmer sections of the state would be out of the market.

I would not have believed, had I not visited the locality, that grapes could be grown there to advantage. I was very much surprised to find at both Independence and Bishop, such varieties of grapes as Malaga, Muscat, Rose of Peru, Flame Tokay, Thompson Seedless, not only growing well, but producing fruit of the very highest quality. I was under the impression that the winters were far too cold for the cultivation of the vinifera types, which I have just mentioned, but I saw vines that were from six to fifteen years old, and although they have not had the care they should have had, they were nevertheless doing well and producing abundant crops of fruits.

In the matter of apples and pears I do not hesitate to say that the Owe River Valley, particularly that secti where the soil conditions are s. able, will produce these fruits n for 100, ing in the greatest abundance but ur- very finest quality. I do not wi ity imply that all the lands of this va he are of the very best grade, as there quite a long stretch of alkali in t lower section, nevertheless there a thousands of acres of fine land whic will eventually develop into a ver extensive fruit section.

Lime on Manure.

Is air slaked lime beneficial for hen manure or horse manure? Is it a good practice to scatter over the pile at different times? For what does hen manure sell in Southern California?—Subscriber, Ventura.

Air slaked lime may be beneficial on soil after application of manure or it is good to assist in decomposition, but its use is liable to liberate the gases in the manure so as to result in loss unless care is exercised in the use of absorbents, and in keeping moisture present. We do not know that any established price obtains as to hen manure, but have known of some selling between $5 and $6 per ton.

Sending Potatoes to Foreign Countries.

Is there any law in California or the United States which prevents sending potato seed to foreign countries?—Subscriber, Santa Barbara?

We have never heard of any restrictions and cannot see wherein there should be any point raised. If any question should come it would be as to the foreign country. Almost every civilized country excepting the United States, has very rigid quarantine laws and probably your potatoes will have to stand inspection at the port of entry.

Chicken Pox.

I am at my wits' end what to do with my chickens. There are six or seven hens that have one eye sore; it festers and the hen gets blind in that eye. At first I though it might be the old disease called Swell head, but now I am sure it is not that because they have a good appetite and do not seem sick at all. Could you send me any remedy? Do you think it is any disease, and should I keep those hens separate from the others? Please let me hear through the Cultivator because I am a subscriber.—Vina.

It is chicken pox and the best cure is to grease the sore places with carbolic salve, or carbolated vaseline. Give the hens a little sulphur in their food, about a quarter of a teaspoon for each hen for a week, and feed them nourishing and easily digested food. I find that bread and milk is the best. The disease is very infectious so keep the sick separate from the others. Chicken pox is fatal with little chicks but not generally with hens, but it will prevent their laying The henneries and yards should be disinfected and kept very clean, as the germs of this and other diseases propagate in dirt.—Mrs. A. B.

Alkali Resistant Fruits.

What fruit, grapes or deciduous, will do best in alkali land? Will apricots grow in alkali? Is there any stock on which apricots may be budded which will do well in alkali?—Subscriber, Laton.

As our subscriber does not give the amount of alkali it is impossible to

answer definitely, but we may say that he California Experiment Station has ermined that the greatest amount total salts in the first three feet of in which grape vines were found show no injury was 0.3 per cent, d of this one-fifth was carbonates black alkali. When the total was 0.5 to 0.6 per cent in the three feet and carbonates d the half of it, vines were d. In any case raisin grapes, in ich highest content of sugar is de- ed, should not be grown in alkali ils. As to the effect upon trees: It impossible to say, for the reason at so much depends upon subsoil nditions. In a general way we may y that nearly all fruit trees are in- ired by standing water, and it is usu- lly characteristic of alkali soils that the water table is high. Injury which has been observed in alkali lands may have been from the presence of the salt in the land or from the water. As to tolerance of alkali, the date palm will probably stand the most of any fruit. Other fruits in order would be pomegranate, pear, quince, olive, fig, apple, almond, peach, prune, orange and lemon. As the apricot is usually on the peach root or in heavy moist soils on the Myrobalan plum root, it should be observed that these fruits are the least tolerant of any.

Fertilizer in Tree Holes.

Is it wise to place fertilizer in holes at time of planting trees, and what kind is best?—Subscriber, Laton.

We would not put any fertilizer in the holes. If near the young rootlets it might do injury, and in any case the soil is usually rich enough to enable the tree to get its start. After the dirt is fairly well filled in so as to be above all the finer roots, then it might be wise to put in some of the higher grade commercial fertilizers, and then as the dirt is left hollowed out around the tree of course stable manure as a mulch is very desirable. In placing mulch around trees, however, care must be observed to prevent a thick pile of coarse strawy manure against the trunk of the tree. It has been known to heat and destroy the bark of young trees.

Bitter Almonds.

Where may I secure bitter almonds? —Subscriber, Auburn.

Can any of our subscribers inform us on this point?

Olive Questions.

What is the best soil for olives? How old are they before beginning to bear? Which is the best variety for pickles, also for oil? Are there any diseases known to the olive? Why are they not more extensively planted?—H. Calpella.

The best soil is a sandy or gravelly loam with good subsoil drainage. The olive does not like wet feet. Will often bear some fruit at three or four years, and of course increasing from that on. The most common variety is the Mission, and is excellent for either pickles or oil. See articles by Dr. Coit, Mr. Tofanelli and others in last week's ssue. Yes, there are troubles with he olive, as with practically all other ruit trees. The black scale infests in most sections. In the interior valleys, where greater summer heat obtains, the scale is less objectionable. One reason why they are not more extensively planted this year is that the trees cannot be secured. A large planter from the Sacramento Valley recently made a trip to Southern California, visiting almost every nursery in order to secure more trees.

Interior Rot of Potato.

What is the cause of black interior rot infesting potatoes in this section? —Subscriber, Cucamonga.

This was referred to Professor Ralph E. Smith, who had no further information as to conditions than given above. He writes:

"We do not know the cause of the internal black rot of potatoes, referred to in your letter. I presume that what you refer to is a disease which we now have under investigation in the northern part of the state. We made an extensive fertilizer experiment along this line during the past season, but did not seem to get much effect from various fertilizers on the prevalence of the trouble. I cannot, of course, be positive that this is the same disease which you have in mind. It would be well for you to send us specimens if possible."

Seedless Valencias.

Is a seedless Valencia common? I have one in my orchard which is now bearing an entirely seedless orange. The fruit is all one could wish in size and flavor and is thin skinned. So far as I can learn, such fruit is very rare.—Subscriber, Globe.

We will ask our subscribers to give of their experience in regard to seedless Valencias. We have seen them, but whether a freak or the regular fruit from certain trees, we are not informed.

Pumping Gas.

Is there a pump which will successfully lift water containing natural gas? Has the pumping of such water been successfully done?—Subscriber, Corcoran.

We believe the only way is a more powerful pump which will overcome the loss which water generating gas occasions. We will be glad to hear from our subscribers who have had experience along this line.

Poisoning Gophers.

Please give remedy for destruction of gophers. They have gained possession of the place, so that I fear trapping is too slow. They have taken several two year old apple trees recently. Am over the orchard frequently in cultivating, and would like to use poison if it is successful.—J. H., Newberg, Oregon.

If they are already taking trees, we would prefer the traps until brought under control. One man with a few dozen traps gets action quicker than any other way. However, poisoning with strychnine is preferred by some where the area is large. Raisins or pieces of small potatoes will usually do the trick. If big fat raisins are chosen, split them open and put a very small amount of strychnine in the center of each, close together, open up the runway and deposit two or three raisins or pieces of potato in which the poison has been placed, then close up the opening made. If the main runway is opened so that it is cut in two, the poison should be put in both ends. Some prefer the poisoned wheat, the same as is prepared for squirrels.

Citrus Trees From Cuttings.

Can orange and lemon trees be grown from cuttings?—Subscriber, Modesto.

They can. Some of the largest lemon trees in California are at San Fernando, Los Angeles County, and were started from cuttings nearly thirty years ago. Oranges will not root quite so readily as the lemons. It is not generally understood that a great many trees not ordinarily propagated from cuttings will form roots and grow from the cuttings. Plums, apricots, eucalyptus and many others are in this class.

Merced Colony
NO. 2

CALIFORNIA FARMERS are buying alfalfa land in Merced Colony No. 2. A large number have already bought and are now improving their places. Long experience with California soils has made these men keen judges of land. They know good land when they see it. That is why they are buying in MERCED COLONY NO. 2.

This land is in Merced County, in the San Joaquin Valley. It is all irrigated. Sold on very easy terms. Call or write today.

IRRIGATION PROBLEMS

Wherever earth ditches are used in irrigating, there is constant danger of a bank giving way (as shown in the illustration). Repairing such a break is hard work—and much damage may be done to the land.

An experience of this nature is impossible with the "K-T SYSTEM" of Irrigation. Described fully in our Brown Book (Sixth Edition)—free for the asking.

Citrus Fruit Market

LOS ANGELES, Dec. 27, 1911.

The lull following the Christmas demand has tended to weaken the orange market. In addition, some fruit has gone forward hardly colored sufficiently, and this has sold rather low. Fully colored and sweet stock is still commanding good returns. The quietness will probably continue until the January trade opens. What the effect of the cold weather will be it is impossible at this time to say. Surely the damage is great, but if greatest care is observed in keeping injured fruit out of the market, the season may continue with good returns.

The lemon market continues indifferent, with prices about the same as the last three weeks. Stored lemons will now be held until higher prices obtain, for the simple reason that the cold weather has taken off every young lemon which would make next summer and fall crop.

Shipments.

Shipments of oranges since Nov. 1, 1911, from Southern California, 1,172 cars; lemons, 711; total, 1,883. To same date last year: Oranges, 3,172 cars; lemons, 666; total, 3,838. Tulare County up to the 25th: Oranges, 2,727 cars; lemons, 68; total, 2,795 cars. Butte County, 460 cars oranges.

NEW YORK, Dec. 26.—Twenty-two cars Navels, six cars lemons sold. Market lower on Navels, easier on lemons—300s size. Cloudy.

THE OLD AND THE NEW YEAR.

The grand Old Year is dying,
His hour has come at last;
His brilliant reign is ended,
Its golden days are past.
He shakes the wreath that, withered,
Lies cold upon his brow;
His breath is quick and labored,
His eyes are closing now.

The grand Old Year is dying,
He bids the world good-night;
A starry veil is lifted
That parts him from our sight.
A sigh of deepest feeling,
A tear, and then a smile,
For scenes of rarest pleasure
Our lonely hearts beguile.

Behold, the New Year cometh!
His face is young and fair;
The merry bells are ringing,
There's music everywhere.
Oh, happy, happy greeting!
Oh, happy, happy day,
That lights our path before us
And laughs our cares away!

—Fanny Crosby.

A NEW YEAR'S WISH.

I wish you a happy New Year! May
roses strew your way,
And paths be glad and peaceful on
which you start today.
May golden shafts of sunshine bring
just a little rain,
And gracious gifts of pleasure hold
just a shade of pain.
For skies are fairer which the clouds
may sometimes overcast,
And pleasures are the best which come
when grief and pain are past.
And if among your roses the ivy is entwined,
Your heart will beat the nearer to the
heart of all mankind.

I wish you a happy New Year! Ah!
who could wish you less?
May all the tender charities that heal
and soothe and bless
Be scattered at your feet like flowers,
and may you e'er impart
To all the weary souls of men the joy
within your heart.
For hearts that hold no love know not
the joy it is to live.
Our lives are measured by the joys
which we to others give.
May charity and kindness your life and
mine imbue,
My joys shall be the brighter for the
joys I wish to you.

—Anon.

TWO SLICES OF MINCE PIE AND A CUP OF MILK.

By Dr. F. A. Blanck.

This is a confession on the part of Mrs. Baxter, and she permits me to tell the story on herself. Running over some old memoranda in my notebook, the other day, I came on the notation:

"Americanus Poisonatus Feminitis—Baxter."

This made me think of Mrs. Baxter just as an average patient of mine in those days, and I laughed.

It was five years ago that Baxter, meeting me on the street one morning, said:

"I don't discredit your skill, doctor, but Mrs. Baxter is a very sick woman, and I'm going to send her to the mountains this summer to see if she can't recover. I hate to do it, for times are dull and I haven't the money to spare."

"See here, Baxter," I replied, "I've been treating your wife [illegible] for a weak heart as [illegible] has any [illegible] ha[illegible] under my care [illegible] had the full truth from her. She has never told me about herself, and when a physician doesn't get that he's at sea. Now you've put me on my mettle and I'll make you this proposition: I'll cure Mrs. Baxter in a week for half the money it will cost you to send her to the mountains; or if I fail I'll pay half of her expenses there. Is it a bargain?"

He pumped my hand up and down and said it was.

"We will begin right now, and you are to answer questions which Mrs. B. always dodges when I put them to her. Question number one:

"'What did you have for dinner yesterday noon?'"

"Roast beef, potatoes, beans, coffee, hot mince pie," he said, quite mixed as to what I was driving at.

"Humph! Hot mince pie! How did Mrs. B. spend the afternoon?"

"She told me she lay down right after dinner until the children came home from school, because she felt sleepy."

"I should think she would! I wonder she ever woke up again. What did you have for supper?"

"Hash, scrambled eggs, cold beef, coffee and cold mince pie."

"Fine—that's excellent! Wonder I wasn't invited in. How did you spend the evening?"

"We called on the Bakers and stayed there until ten, when we came home."

"And then?"

"Nothing—we went to bed."

"No lunch before retiring?"

"Why, I believe Mrs. B. did finish the mince pie and drink a cup of milk. There were two slices of pie left over from supper."

"And when was she taken sick?"

"At two the next morning—cramps, a griping and fluttering sensation about the heart and a feeling of faintness. I worked over her until daybreak, when she fell asleep. Her heart is in a very bad condition."

"Pardon my bluntness, Baxter, but shut up about her heart. I'll call on her as soon as I have finished my office work."

Baxter moved on and I went to my office to laugh. I had finally discovered the secret of Mrs. B.'s heart. Long had been my suspicions, but never a word of confirmation had come from her. As soon as I could, I wrote out a prescription in plain English, tucked it in my book, and hastened to the Baxter home to find Mrs. B. pale and complaining sadly of the certainty of sudden death from heart failure.

When she had finished, I said to her:

"Mrs. Baxter, I'm going to give up your case today and let some other physician care for you. Don't look surprised—we will be friends, but your malady is too mysterious for my skill. I freely admit that. But before going I wish to hand you my last prescription. You can fill it right at home. Here it is, and permit me to get away immediately, as I have several critical cases on this morning."

I was gone before she could recover from her bewilderment at my sudden giving up of her case or read the prescription. What I gave her read like this:

"Americanus Poisonatus Feminitis.

"Two cuts of mince pie, one glass of milk after breakfast.

"Same after dinner.

"Same after supper.

"Same just before retiring.

"Mix well with chocolate cake, no exercise, no fresh air, no long walks, no dieting.

"Apply in any old way to the heart and stomach [illegible]

Leonard [illegible] NURSERY CO.

(Signed) "Blanck, M.D."

Mrs. Baxter has never had a doctor since, nor spoken of heart disease. She looks splendidly and sleeps eight hours every night.

Baxter offered to pay me twice my bill. I am still a welcome visitor at their home.

CAN HAIR TURN WHITE IN A NIGHT?

A cherished popular belief is that of the sudden blanching of the hair from fright, worry or other severe mental strain. It plays its part in the drama and in fiction, while history records its famous instances. Who has not heard that Marie Antoinette's hair turned white during the night before her execution, or that the deeds and terrors of St. Bartholomew's night blanched the hair of Henry the Fourth? Most of us have wondered how the change could come about as readily as tradition relates; and yet so universal is the belief in this phenomenon that few have the hardihood to doubt it. And now Stieda, a hard-headed German scientist, boldly says that it isn't so at all. This refractory German first proves that such a thing couldn't possibly happen, and then, not satisfied, declares that it never did happen. With equal disregard of folk-lore, history and medical literature, he points the finger of doubt, and challenges many long-deceased historians and physicians to arise and prove their stories.

He claims that when the hair turns white under ordinary conditions it does so in one of two ways. Either the pigmented hairs fall out and are replaced by unpigmented hairs, or, less commonly, pigment-production stops in a growing hair and the colorless portion gradually replaces the darker outer segment. As the growing of a new crop of hair in a single night is beyond the possibilities of even the Seven Sutherland Sisters, Stieda must needs discredit all tales of such miraculous transformation, says The Journal of the American Medical Association. This he does in extenso, taking up the best-known instances of such supposed blanching of hair, and finding them all lacking in support sufficient to meet critical consideration, much less such control as to establish an acceptable scientific demonstration. For example, he doubts the story of Marie Antoinette's sudden loss of hair pigment, stating that although the queen certainly was gray at the time of her execution, yet this was no novelty, for she was also gray nine months before, at the time the king met his sudden end at the hands of the revolutionists.

As for the rest of the reputed cases, many are nothing better than old-wives' tales, while others are examples of credulity substituted for healthy skepticism and careful investigation. The explanation for many is unkind, being simply that the keeper of the jail or dungeon in which the unhappy heroine or hero was confined neglected to furnish his guest's dressing table with the hair-dye to which the latter had been accustomed at home, and that Nature asserted herself before release or execution. Verily the iconoclast respects nothing—not even the gray hairs of royalty.

ABOUT CHILDREN'S CLOTHES.

When making children's clothes there are many little ways in which it pays to leave a chance for enlarging, such as making the waist two or three inches longer than necessary as well as the sleeves and skirt, then the belt can be set up on the waist; the cuffs up on the sleeves, and a wide tuck taken in the hem of the skirt before it is turned down, so these allowances can be let out as needed. A dress that is not very much outgrown can be made large enough by opening the shoulder seam and setting in a band of some material that will match the dress, then a band can be set in the skirt and a belt and cuffs made of the trimming goods. A dress that is entirely outgrown can be made large enough, which is well worth while if the material is still good. Rip the dress apart and press the pieces and wash them if necessary; then cut a new waist and sleeve lining and make them fit the little girl nicely, and trim the dress with plaid goods to match the dress goods. Make a new yoke, belt and cuffs of the plaid, then cut the skirt apart about six inches from the bottom and insert a lining of the width to make the skirt the desired length; then stitch a bias fold of the plaid goods over this lining and it will be as nice as a new dress. A good way to make strong buttonholes in children's clothes is to make the place where the hole is to be cut; then lay a strong thread around the place and fasten it down by bringing the needle up through the fabric on one side of the thread and putting it down on the other, and when you have gone entirely around the thread, cut the button hole and work over the thread. A pale blue woolen dress was made into a beautiful dress for a small girl by ripping it apart and coloring it a rich dark blue with Diamond dye for wool, and a faded light cloth jacket was colored the same shade of blue, and this provided a stylish suit for a very small sum of money. A pretty red sweater that had faded was washed clean and then colored a rich dark red, which made it prettier than when new. It is easy to make a dress from old material with the aid of a good pattern, for each piece can be placed on the cloth and the piecing made to come where it can be concealed by rows of braid or other trimming.—A. M. H.

A GOVERNMENT DOMESTIC SCIENCE SCHOOL.

By Consul P. Emerson Taylor, Stavanger, Norway.

A number of reports from this consulate upon various phases of Norwegian governmental activity designed to benefit the people have been published in Daily Consular and Trade Reports. Among these were reports upon the Bolig (Dwellings) Bank, through which the government makes liberal low-rate loans to the working people for building homes (issue of Aug. 22, 1910); the municipal employment bureau, conducted by the city government in the interest of both workmen and employers of labor (issue of Apr. 18, 1911); government aid to the dairying industry (issue of Sept. 20, 1910), and some others.

Just now the government, in co-operation with the city authorities, is establishing in Stavanger a domestic science school, intended to afford a complete course in housekeeping to young girls over 16 years of age. A course in housekeeping is now a part of the curriculum in the regular public schools of the city, there being a well-furnished modern kitchen and suite of rooms for this purpose in one of the modern public school buildings. This public school course is available only for the girls who have not yet entered the "middle school," which is usually reached about the age of 13 or 14 years. The purpose of the new government school of domestic science is to afford an opportunity for training in housekeeping to those young girls who did not receive such training in their public school course (the domestic science course in the public schools was started only two years ago in its present form). It is especially designed to give a year's training in housekeeping to girls who have been working in factories and have not had adequate training in housekeeping either in school or at home. The course as outlined places special stress upon the economics of housekeeping, including economy in buying as well as in the management of the house.

Equipment and Course of Study.

Six rooms are now being fitted up for the purpose in the basement of the new Vaaland school building, in the third story of which the public school

New Land Opening

Under the

Kuhn California Project in the Sacramento Valley

The canal, drainage and road construction has been completed on the Delevan and Maxwell Units and these lands are now being sold in 10, 20 and 40-acre subdivisions.

The soil is a deep alluvial silt loam and is some of the best in the valley. The main line of the Southern Pacific Railroad passes through the land. Four trains daily each way North and South.

Towns, Schools and Churches Near at Hand

CROPS—All kinds of fruits, including oranges, lemons, cereals, seed, alfalfa, cattle, hogs and chickens.

WATER SUPPLY—Practically unlimited. Cost to the irrigator very low. Canal and drainage system the very best. Water delivered to boundary of every 40-acre tract.

TRANSPORTATION—Both by rail and river to the great metropolitan centers.

LAND PRICES—Low and terms of payment easy.

If you want to secure a home in California's Famous Valley, where climate, soil and water are combined to work for you overtime, cut out the attached coupon and mail to us for full particulars.

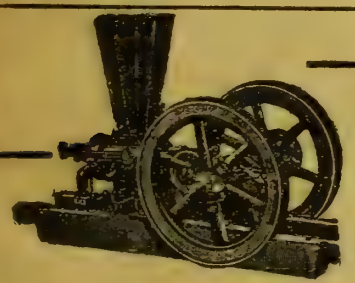
TEN YEARLY PAYMENTS

training in housekeeping is given. The rooms are all light, pleasant ,and sanitary, and are well furnished. One room is fitted up as a kitchen with good stoves and modern kitchen equipment; the other five rooms will be used, respectively, for washroom, room for training and demonstration, dining and serving room, hall, and ironing room. In the nine months' course the fall term runs from August 15 to December 15, and the spring term from January 15 to June 15. At the end of each term the pupils will undergo an examination.

The subjects taught include study of foods, domestic economy, cooking, soteriology, social usages, and temperance. Three teachers will be employed to start with. The city council has appointed five members of the school board of the city as managing directors of the school for three years.

The school is starting with about 20 pupils. They are required to pay 5 crowns ($1.34) per month, which is to include both tuition and boarding. Of the initial expenses and the maintenance of the school the government furnishes three-fourths and the city one-fourth.

The hours for school work will be 8 a. m. to 2 p. m., and 4 p. m. to 6 p. m. Only pupils will be admitted who have passed their sixteenth year, who have a certificate of good character from the schools or from their employers or guardians, and who present a certificate from a practicing physician that they are in good health.



Distillate Engine

Mounted on wood skids, complete with 8 x 6 Pulley, Batteries, Spark Coil, Fuel Tank, Lubricators, Muffler, Wire and Switch.

The Patented Galvanized Hopper for cooling is made of one piece of sheet iron, heavily galvanized all over after completion. The circulation is perfect and evaporation slight, making an ideal cooling device.

They are built in two sizes and both rated well below the power they will develop.

CHICKEN RECIPES.

Chicken Soup.

An old fowl will do and makes a variety with the meat made into croquettes or pie, or escalloped chicken, or creamed chicken, or chicken with biscuits, or some other way you prefer. The fat must all be skinned off and thin cream or rich milk added as well as a little rice or macaroni.

Croquettes.

Use a tablespoonful each of butter and flour and a cupful of milk made into a thick white sauce. Add minced chicken enough to make it stiff. Allow it to cool and form into shapes and roll in egg and crumbs. I fry them like potato balls.

Escalloped Chicken.

Made by buttering a pan and dusting with crumbs. Add a layer of chicken cut in small pieces and removed from the bones; butter, etc., crumbs, chicken and seasoning, with the crumbs on top. Pour into the pan enough gravy, chicken stock or rich milk to nearly fill to the top of the mixture and bake. An old, old way is to serve the fowl with biscuits.

Chicken with Biscuits.

Bake the biscuits and have them done just as the chicken is all ready to serve. Dish the chicken in the center of a large platter; split the biscuits and make a border, and cover them with gravy. This is for a large family.—Nebraska Farmer.

THE WISE FARMER.

There was a man in our town
And he was wondrous wise,
He knew that if he wanted crops
He'd have to fertilize.

"It's nitrogen that makes things green"
Said this man of active brain;
"And potash makes the good strong straw,
And phosphate plumps the grain.
But it's clearly wrong to waste plant food
On a wet and soggy field;
I'll surely have to put in drains
If I'd increase the yield.

And after I have drained the land
I must plow it deep all over;
And even then I'll not succeed
Unless it will grow clover.
Now acid soils will not produce
A clover sod that's prime;
So if I have a sour soil,
I'll have to put on lime.

And after doing all these things,
To make success more sure,
I'll try my very best to keep
From wasting the manure.
So I'll drain, and lime, and cultivate,
With all that that implies;
And when I've done that thoroughly
I'll manure and fertilize.
—Vivian, College of Agriculture, Ohio.

For white sauces of the ordinary consistency, used for cream toast, creamed vegetables, escalloped dishes and others, a very satisfactory formula is: One cup of milk, one tablespoon each of butter and flour and one-half teaspoonful of salt. Heat the milk slightly in the top of the double boiler. After rubbing together the butter and flour and salt, add a little of the heated milk and mix smoothly. Add the mixture to the rest of the milk in the boiler and cook with the water boiling until well thickened, stirring occasionally to keep it smooth.

THE HOOK-UP-WORM.

"See that measuring worm crawling up my skirt" cried Mrs. Bjenks. "That is a sign that I am going to have a new dress."

"Well, let it make it for you," growled Mr. Bjenks. "And while he's about, have him send a hook worm to do you up the back. I'm tired of the job."—Liverpool Mercury.

SECURITY SAVINGS BANK

Spring and Fifth Sts. Los Angeles, Cal.

OLDEST AND LARGEST IN THE SOUTHWEST

SECURITY BUILDING Ground floor and Basement occupied by the Security Savings Bank and Safe Deposit Vaults.

Capital and Reserve $2,000,000.00

The Safe Deposit and Storage Department is the largest and best equipped in the West

New Model 27 **Marlin REPEATING RIFLE**

The only gun that fills the demand for a trombone ("pump") action repeater in .25-20 and .32-20 calibres.

Shoots high velocity smokeless cartridges, also black and low pressure smokeless. Powerful enough for deer, safe to use in settled districts, excellent for target work, for foxes, geese, woodchucks, etc.

Its exclusive features: the quick, smooth working *"pump" action*; the wear-resisting *Special Smokeless Steel* barrel; the modern *solid top* and *side ejector* for rapid, accurate firing, increased safety and convenience. It has take-down construction and *Ivory Bead* front sight; these cost extra on other rifles of these calibres.

Our 136 page catalog describes the full *Marlin* line. Sent for three stamps postage. Write for it.

The Marlin Firearms Co. 124 Willow Street New Haven, Conn.

LIGHT UP!

INDEX

California Cultivator

Volume XXXVII

July to Dec., Inclusive, 1911

NOTE:—The issue of The Cultivator of September 14th incorrectly carried the same pages as the preceding issue, that of September 7th. To distinguish between these in the index, articles in the issue of the 7th are designated by affixing to page number the letter (a); in the same way articles in the issue of the 14th have the letter (b) affixed to page numbers. Thus: "Pruning the Orange" in the issue of September 7th is indexed as appearing on Page 218a, while "Processing Citron" in the issue of September 14th is indexed as 218b.

(Continued from Page 678.)

gone broke," to use a common expression in our state, it was because invariably they had overlooked or did not consider the importance of one or more of the points we have endeavored to impress on you.

ELECTRIC LIGHT ON THE FARM.

(Continued from Page 682.)

ad from a number of companies at a ost not exceeding $400. Adding to his $250 for wiring of buildings, fixres and building to house the plant, makes the complete cost $650. The apacity of the plant may be doubled t an additional cost of about $200.

The engine need be operated for a eriod of about eight hours at interals of from two days to two weeks, epending upon the amount of light sed and the capacity of the plant, he light being drawn between times om the storage battery. During the harging period the plant does not eed constant attention, and a man orking about the farm or the housefe can do all that is necessary at inrvals of about two hours each.

Considering the great advantage hich such plants have, and their lack disadvantage, I hope the time is not r off when they will receive the attntion which they merit, and, as a sult, become at least as common on e farm as the automobile.—F. H. osencrants, Colorado Agricultural ollege.

DIVIDEND NOTICE.

THE GERMAN SAVINGS AND LOAN SOCIETY

(The German Bank)

Member of the Associated Savings Banks of San Francisco,

526 California St., San Francisco

For the half year ending December 31, 1911, a dividend has been declared at the rate of four (4) per cent per annum on all deposits, free of taxes, payable on and after Tuesday, January 2, 1912. Dividends not called for are added to the deposit account and earn dividends from January 1, 1912.

George Tourny, Manager.

ORTHO.

Since seeing the word "Ortho" in big letters on a building in Watsonville, a long time ago, we have often wondered what the word meant. We have also seen the sprays which came from that building and upon the cans have noticed "Ortho" of strange device.

We presume Mr. Luther, who is manager of the institution in question, would describe the word in learned terms in which would appear "hydration" and perhaps some others, but we note the dictionary gives one meaning somewhat separated from chemistry which we will apply at this time. This meaning as given by Webster is "A combining form signifying straight, right, upright, correct, regular, as orthodiagonal, orthodox, orthographic, etc." We do not know that orthodox has anything to do with Ortho sprays, but from information which has come to us from those who have used them, we have belief that they are strictly true to name and are upright and correct in every way.

In conversation with Mr. Luther at Watsonville at the time of the last Apple Show, he referred to one orchardist who had been supplied with Ortho Arsenate of Lead. "Ortho 30" or "Ortho 40," we believe they call it now. He remarked that he and the owner of the orchard stood ready to give $1.00—or was it $2.00?—for each apple in that orchard which possessed a worm. The proffer was not only made to the writer, but to many others at the time of the Apple Show. The search was diligent, but no wormy apples were found. The Ortho Sprays have won, because of not only being most effective, but their use results in less injury to the tree of any spray which has been effective against the dreaded codling moth.

Another poisonous insecticide offered by the Company, which, by the way, is the California Spray Chemical Co., is "Ortho 40," guaranteed to contain 40 per cent arsenious oxide. This insecticide is said to work admirably in dry interior valleys where there is little moisture in the atmosphere, and is one of the best and cheapest insecticides.

Probably the preparation put out in the greatest quantity by this concern is the Ortho Lime Sulphur solution. This is prepared so as to get the highest possible efficiency without injury to the tree. It is made from pure lime and sulphur and its friends promise for it that "It will test higher than any lime-sulphur solution manufactured." It is a clear ruby-colored liquid, weighing 11 pounds to the gallon and containing the highest amount of the sulphur that can remain in solution under all conditions. This solution tests approximately 36 degrees Baume, and is of a strength that for spraying should be diluted 1-11.

KILLS HIS FRIENDS.

Thousands of dollars have been spent by the department of agriculture in the efforts to exterminate insect pests. The lady bug was introduced because of its great liking for the aphis and yet we hear of one man who finding some of the spotted beauties on his favorite apple tree, made it a daily business to kill all he found. not knowing that they were preying upon the aphis that were sucking the life from his tree. It behooves us to study insect life as it does bird life for fear we may destroy those most useful to mankind.—Green's

California Cultivator
Clubbing Price List

For Season 1911-1912

This magazine price list is prepared annually for the convenience and benefit of Cultivator subscribers. The prices given allow our readers the benefit of the lowest figures possible, in return for which, all we require is that to all orders a year's subscription to The Cultivator (class 18) be added at 90c (regular price $1.00 per year).

Find on this sheet a very complete list of the most popular magazines. We can, however, supply any periodical published. The lowest price on any not listed here will be quoted on request. Let us make you a price on any combination you may desire.

Periodicals in any combination may be ordered to the same or different addresses. Foreign or Canadian subscriptions are extra on account of added postage, and prices must be gotten by correspondence. Subscriptions may be either "new" or "renewals (except where otherwise stated in the list), but it is important that this information be given in each case.

Books—Send us a postal for our list of agricultural books which we supply subscribers and which we recommend as most suited to California conditions.

The pricing of various combinations of magazines is a simple matter; all are listed according to class number and this class number multiplied by 5 gives the cost price.

EXAMPLE:

Class No.	Regular Price
23—American Magazine	$1.50
35—The Review of Reviews	3.00
20—Good Housekeeping (or Cosmopolitan	1.50
18—Cultivator	1.00
96×5=$4.80—Club price for all. Amount saved on this club	$1.20

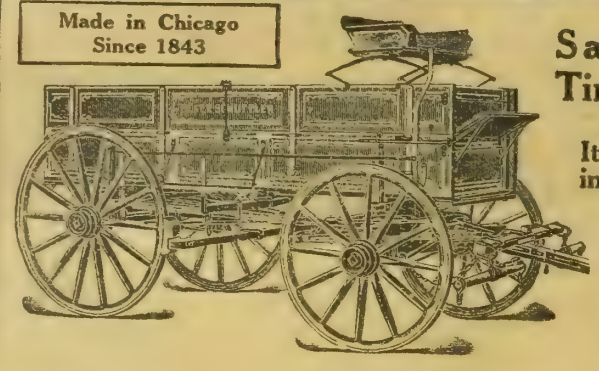
THE "ONE BEST" WAGON MADE

IF YOU could go through the immense "Schuttler" factory—see with your own eyes the thorough way in which every part of the "Peter Schuttler" wagon is made—you would then know why it is that "Schuttler" wagons cost more and are acknowledged to be the strongest, most durable and lightest running wagons in the world. You would see nothing but the highest grade of hickory and white oak as it receives its natural air-dried seasoning—an enormous blacksmith shop filled with old-fashioned blacksmiths, who fit all irons on the gears, hot—the only way of obtaining a perfect fit that will stay and preserve the wood—how the wheels are specially made, in the re-turning of the hubs, driving of the spokes, putting on of the felloes and shrinking on of the tires hot, in the old-fashioned way, the reason "Schuttler" wheels are strong and the tires always stay tight—how the gears are assembled and laid out separately for each wagon, the only way of knowing a wagon will run true—how the boxes and bottoms of uniformly choice and extra heavy material are carefully put together to last—how the seats are specially constructed for comfort with extra long seat springs—how the paint is ground in oil and put on by the brush, not dipped—the reason for its lasting so long. These are some of the many reasons why the "Schuttler" is not only the best, but positively the cheapest wagon in the long run. There is no more profit in a "Schuttler" than in other wagons. They simply cost that much more to make, and the user gets the benefit.

THE OLD RELIABLE PETER SCHUTTLER WAGON

Made in Chicago Since 1843



Saves Money, Time and Trouble

It will pay you to investigate before buying

Come in and inspect the Schuttler

For Sale by

JOHN DEERE

The World's Best in Steel Plow Building

* * *

A plow gets a good reputation by reason of its quality, and not on account of its price. Goods that have the reputation are the biggest sellers on the market.

John Deere Plows outsell all others, and today there are more of them in actual use than any other make of steel Plows.
